**Proprietary Statement** This manual contains proprietary information of Zebra Technologies Corporation and its subsidiaries ("Zebra Technologies"). It is intended solely for the information and use of parties operating and maintaining the equipment described herein. Such proprietary information may not be used, reproduced, or disclosed to any other parties for any other purpose without the express, written permission of Zebra Technologies.

**Product Improvements** Continuous improvement of products is a policy of Zebra Technologies. All specifications and designs are subject to change without notice.

**Liability Disclaimer** Zebra Technologies takes steps to ensure that its published Engineering specifications and manuals are correct; however, errors do occur. Zebra Technologies reserves the right to correct any such errors and disclaims liability resulting therefrom.

**Limitation of Liability** In no event shall Zebra Technologies or anyone else involved in the creation, production, or delivery of the accompanying product (including hardware and software) be liable for any damages whatsoever (including, without limitation, consequential damages including loss of business profits, business interruption, or loss of business information) arising out of the use of, the results of use of, or inability to use such product, even if Zebra Technologies has been advised of the possibility of such damages. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.

<sup>^</sup> ZZ Printer Sleep .....	370
<b>ZPL RFID Commands .....</b>	<b>371</b>
RFID Command Overview .....	372
Printer and Firmware Compatibility .....	373
<sup>^</sup> HL or ~HL Return RFID Data Log to Host .....	377
<sup>^</sup> HR Calibrate RFID Tag Position .....	379
<sup>^</sup> RA Read AFI or DSFID Byte .....	386
<sup>^</sup> RB Define EPC Data Structure .....	388
<sup>^</sup> RE Enable/Disable E.A.S. Bit .....	390
<sup>^</sup> RF Read or Write RFID Format .....	391
<sup>^</sup> RI Get RFID Tag ID .....	395
<sup>^</sup> RL Lock/Unlock RFID Tag Memory .....	396
<sup>^</sup> RLM – Lock/Unlock the Specified Memory Bank .....	396
<sup>^</sup> RLB – Permanently Lock Specified Memory Sections .....	397
<sup>^</sup> RM Enable RFID Motion .....	399
<sup>^</sup> RN Detect Multiple RFID Tags in Encoding Field .....	400
<sup>^</sup> RQ Quick Write EPC Data and Passwords .....	401
<sup>^</sup> RR Specify RFID Retries for a Block or Enable Adaptive Antenna Selection .....	403
<sup>^</sup> RS Set Up RFID Parameters .....	405
<sup>^</sup> RT Read RFID Tag .....	412
<sup>^</sup> RU Read Unique RFID Chip Serialization .....	414
~RV Report RFID Encoding Results .....	416
<sup>^</sup> RW Set RF Power Levels for Read and Write .....	417
<sup>^</sup> RZ Set RFID Tag Password and Lock Tag .....	421
<sup>^</sup> WF Encode AFI or DSFID Byte .....	424
<sup>^</sup> WT Write (Encode) Tag .....	425
<sup>^</sup> WV Verify RFID Encoding Operation .....	427
<b>ZPL Wireless Commands .....</b>	<b>429</b>
<sup>^</sup> KC Set Client Identifier (Option 61) .....	430
<sup>^</sup> NB Search for Wired Print Server during Network Boot .....	431
<sup>^</sup> NN Set SNMP .....	432
<sup>^</sup> NP Set Primary/Secondary Device .....	433
<sup>^</sup> NT Set SMTP .....	434
<sup>^</sup> NW Set Web Authentication Timeout Value .....	435
<sup>^</sup> WA Set Antenna Parameters .....	436
<sup>^</sup> WE Set WEP Mode .....	437
<sup>^</sup> WI Change Wireless Network Settings .....	439
<sup>^</sup> WL Set LEAP Parameters .....	441
~WL Print Network Configuration Label .....	442
<sup>^</sup> WP Set Wireless Password .....	443
<sup>^</sup> WR Set Transmit Rate .....	444
~WR Reset Wireless Radio Card and Print Server .....	445
<sup>^</sup> WS Set Wireless Radio Card Values .....	446
<sup>^</sup> WX Configure Wireless Securities .....	448
Supporting Parameters for Different Security Types .....	451
<b>ZBI Commands .....</b>	<b>457</b>
Introduction to Zebra Basic Interpreter (ZBI) .....	458

# Functional List of ZPL Commands

Abort Download Graphic .....	172	Display Description Information .....	236
Advanced Text Properties .....	313	Download Bitmap Font .....	164
ANSI Codabar Bar Code .....	112	Download Bounded TrueType Font .....	174
Applicator Reprint .....	322	Download Encoding .....	166
Aztec Bar Code Parameters .....	118	Download Files .....	651
Aztec Bar Code Parameters .....	58	Download Format .....	168
Bar Code Field Default .....	142	Download Graphics .....	169
Battery Status .....	213	Download Intellifont (Scalable Font) .....	173
Cache On .....	156	Download Objects .....	176
Calibrate RFID Tag Position .....	379	Download Unbounded TrueType Font .....	175
Cancel All .....	244	EAN-13 Bar Code .....	104
Cancel Current Partially Input Format .....	272	EAN-8 Bar Code .....	77
Change Alphanumeric Default Font .....	148	Early Warning Settings .....	252
Change Backfeed Sequence .....	268	Enable Communications Diagnostics .....	248
Change Caret .....	146	Enable RFID Motion .....	399
Change Delimiter .....	147	Enable/Disable E.A.S. Bit .....	390
Change International Font/Encoding .....	149	Encode AFI or DSFID Byte .....	424
Change Memory Letter Designation .....	153	End Format .....	369
Change Network Settings .....	307	Erase Download Graphics .....	180
Change Tilde .....	159	Field Block .....	181
Change Wired Networking Settings .....	311	Field Clock .....	184
Change Wireless Network Settings .....	439	Field Data .....	185
CODABLOCK Bar Code .....	85	Field Hexadecimal Indicator .....	186
Code 11 Bar Code .....	60	Field Number .....	194
Code 128 Bar Code (Subsets A, B, and C) .....	89	Field Orientation .....	202
Code 39 Bar Code .....	64	Field Origin .....	195
Code 49 Bar Code .....	68	Field Parameter .....	196
Code 93 Bar Code .....	81	Field Reverse Print .....	197
Code Validation .....	160	Field Separator .....	198
Comment .....	204	Field Typeset .....	199
Configuration Label Return .....	217	Field Variable .....	201
Configuration Update .....	270	Font Identifier .....	162
Configure Wireless Securities .....	448	Font Linking .....	188
Cut Now .....	155	Get RFID Tag ID .....	395
Data Matrix Bar Code .....	138	Graphic Box .....	205
Define EPC Data Structure .....	388	Graphic Circle .....	207
Define Language .....	276	Graphic Diagonal Line .....	208
Define Password .....	279	Graphic Ellipse .....	209
Define Printer Name .....	277	Graphic Field .....	210
Detect Multiple RFID Tags in Encoding Field .....	400	Graphic Symbol .....	212
Disable Diagnostics .....	249	Graphing Sensor Calibration .....	251

GS1 Databar	129	Printer Sleep	370
Halt ZebraNet Alert	343	Printing Mirror Image of Label	317
Head Diagnostic	214	Programmable Pause	320
Head Test Fatal	262	QR Code Bar Code	122
Head Test Interval	269	Quick Write EPC Data and Passwords	401
Head Test Non-Fatal	263	Read AFI or DSFID Byte	386
Host Directory List	233	Read or Write RFID Format	391
Host Format	215	Read RFID Tag	412
Host Graphic	216	Read Unique RFID Chip Serialization	414
Host Identification	218	Recall Format	366
Host Linked Fonts List	230	Recall Graphic	367
Host Query	220	Remove Label	158
Host RAM Status	219	Report RFID Encoding Results	416
Host Status Return	227	Reprint After Error	273
Host Verification	232	Reset Advanced Counters	327
Image Load	240	Reset Optional Memory	246
Image Move	241	Reset Wireless Radio Card and Print Server	445
Image Save	242	Return RFID Data Log to Host	377
Industrial 2 of 5 Bar Codes	108	Return ZebraNet Alert Configuration	231
Initialize Flash Memory	245	Scalable/Bitmapped Font	54
Interleaved 2 of 5 Bar Code	62	Search for Wired Print Server during Network Boot	431
Kill Battery (Battery Discharge Mode)	274	Select Date and Time Format (for Real Time Clock)	275
Kiosk Values	280	Select Encoding Table	330
Label Home	285	Select the Primary Network Device	305
Label Length	286	Sensor Select	267
Label Reverse Print	287	Serialization Data	337
Label Shift	288	Serialization Field (with a Standard ^FD String)	331
Label Top	289	Set All Network Printers Transparent	310
List Font Links	284	Set Antenna Parameters	436
Lock/Unlock RFID Tag Memory	396	Set Auxiliary Port	258
LOGMARS Bar Code	114	Set Battery Condition	250
Map Clear	292	Set Client Identifier (Option 61)	430
Maximum Label Length	296	Set Currently Connected Printer Transparent	312
Media Darkness	293	Set Darkness	329
Media Feed	294	Set Date and Time (for Real-Time Clock)	347
Media Tracking	299	Set Dots per Millimeter	261
Media Type	302	Set Dynamic Media Calibration	368
MicroPDF417 Bar Code	106	Set Label Length	260
Mode Protection	300	Set LEAP Parameters	441
Modify Head Cold Warning	304	Set Maintenance Alerts	290
MSI Bar Code	116	Set Maintenance Information Message	295
Multiple Field Origin Locations	191	Set Media Sensor Calibration	247
Network Connect	306	Set Media Sensors	345
Network ID Number	309	Set Mode and Language (for Real-Time Clock)	335
Object Delete	238	Set Offset (for Real-Time Clock)	340
Pause and Cancel Format	264	Set Primary/Secondary Device	433
PDF417 Bar Code	73	Set Printhead Resistance	344
Planet Code bar code	72	Set RF Power Levels for Read and Write	417
Plessey Bar Code	120	Set RFID Tag Password and Lock Tag	421
POSTAL Bar Code	144	Set Ribbon Tension	271
Power On Reset	266	Set Sensor Intensity	334
Present Length Addition	316	Set Serial Communications	328
Present Now	318	Set SMTP	434
Print Configuration Label	355	Set SNMP	432
Print Directory Label	356	Set Transmit Rate	444
Print Mode	297	Set Units of Measurement	303
Print Network Configuration Label	442	Set Up RFID Parameters	405
Print Orientation	319	Set Web Authentication Timeout Value	435
Print Quantity	321	Set WEP Mode	437
Print Rate	323	Set Wireless Password	443
Print Start	325	Set Wireless Radio Card Values	446
Print Width	326		

Set ZebraNet Alert .....	348
Set ZPL Mode .....	350
Slew Given Number of Dot Rows .....	314
Slew to Home Position .....	315
Specify RFID Retries for a Block or Enable Adaptive Antenna Selection .....	403
Standard 2 of 5 Bar Code .....	110
Start Format .....	364
Start Print .....	341
Start ZBI (Zebra BASIC Interpreter) .....	255
Start ZBI (Zebra BASIC Interpreter) .....	257
Suppress Backfeed .....	365
Tear-off Adjust Position .....	351
Terminate Zebra BASIC Interpreter .....	265
Text Blocks .....	352
TLC39 Bar Code .....	134
Transfer Object .....	353
UPC/EAN Extensions .....	131
UPC-A Bar Code .....	136
UPC-E Bar Code .....	79
Upload Graphics .....	235
UPS MaxiCode Bar Code .....	101
Use Font Name to Call Font .....	56
Verify RFID Encoding Operation .....	427
Write (Encode) Tag .....	425
Write Query .....	357

# About This Document

This section provides an overview of the entire document, contact information, and details on document structure and organization.

## Contents

Contact Zebra .....	40
Introduction .....	40
Who Should Use This Document.....	40
How This Document Is Organized.....	41

## Contact Zebra

To contact Zebra or for technical support, visit [www.zebra.com/contact](http://www.zebra.com/contact).

## Introduction

This guide is the unabridged, alphabetical reference of programming commands supported in the firmware. This includes all ZPL commands and SGD commands.

**Important** • These are important points to note when using ZPL and SGD commands:

- ZPL and SGD commands should be sent to the printer as separate files.
- Certain settings can be controlled by both ZPL and SGD. Configuration changes made in ZPL can affect configuration changes made in SGD.

**Firmware** You can get the printer's firmware version by printing out a configuration label. For instructions to do so, see your printer's user guide.

**Note** • For firmware upgrades go to: [www.zebra.com](http://www.zebra.com).

**Important** • These are important points to note when using a Zebra G-Series printer:

- You can send instructions to the printer using multiple programming languages: EPL, ZPL, or SGD. EPL and ZPL commands configure the printer, print labels, and get device status information. SGD commands set and get configuration details. These three languages can be used without the need to send the printer instructions to switch from one language to another.
- EPL, ZPL, and SGD commands must be sent to the printer as separate files. They cannot be used together in one format, or set of commands. For example, if you send a series of SGD commands to the printer and they are followed by a printable format, this needs to be done using separate files.

Many text editors and word processors can recreate most examples in this guide in ASCII format. However, for other encodings such as Unicode, a text editor such as Microsoft Notepad is needed.

If there are any terms used in this guide that you need clarification on, see the [Glossary on page 1491](#).

## Who Should Use This Document

This Programming Guide is for programmers who are familiar working with programming languages.

## How This Document Is Organized

The Programming Guide is set up as follows:

Section	Description
<a href="#">About This Document</a>	Provides a high-level overview about this guide and Zebra Programming Language (ZPL).
<a href="#">ZPL Commands</a>	Provides an alphabetical, detailed description of each ZPL command.
<a href="#">ZPL RFID Commands</a>	Provides an alphabetical, detailed description of each ZPL RFID command, and some examples of how to use them.
<a href="#">ZPL Wireless Commands</a>	Provides new and modified ZPL commands for the wireless print server.
<a href="#">ZBI Commands</a>	Provides details about the Zebra Basic Interpreter, its commands, descriptions, formats, and parameters.
<a href="#">SGD Printer Commands</a>	Provides a high-level overview of printer setting Set / Get / Do (SGD) commands.
<a href="#">SGD Wired Commands</a>	Provides a high-level overview of the wired Set / Get / Do (SGD) commands.
<a href="#">SGD Wireless Commands</a>	Provides a high-level overview of the wireless Set / Get / Do (SGD) commands.
Appendices	The appendixes include: <a href="#">Zebra Code Pages</a> <a href="#">ASCII</a> <a href="#">Fonts and Bar Codes</a> <a href="#">Mod 10 and Mod 43 Check Digits</a> <a href="#">Error Detection Protocol</a> <a href="#">ZB64 Encoding and Compression</a> <a href="#">Field Interactions</a> <a href="#">Real Time Clock</a> <a href="#">ZBI Character Set</a> <a href="#">SGD Command Support</a> <a href="#">Firmware Features</a> <a href="#">Mirror</a> <a href="#">Wireless Markup Language (WML)</a> <a href="#">Using Weblink</a> <a href="#">HTTP POST Alerts</a> <a href="#">Advanced Techniques</a>
<a href="#">Glossary</a>	Glossary of terms.

# ZPL Commands

This section contains the complete alphabetical listing of ZPL II commands.

The first paragraph(s) provides an explanation of how the command is used, what it is capable of, and any defining characteristics it has.

The format explains how the command is syntactically arranged and what parameters it contains. For example, the **^B8** command prints a EAN-8 bar code. The format of the **^B8** command is: **^B8o,h,f,g**. It is arranged with the caret symbol (^), the command code (B8), and the parameters and are replaced with supported values.

In the parameters table, if a command has values that can be defined to make its function more specific, these are outlined as parameters.

Still using the **^B8** example, the **h** parameter is defined as:

<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
---	---

If the command has no parameters – for example **~JA** (Cancel All) – the parameter heading is removed, indicating that the format of the command (**~JA**) is acceptable ZPL II code.

**Example:** When the command is best clarified in context, an example of the ZPL II code is provided. Text indicating exact code entered is printed in an easily recognizable Courier font. An example of code using the **^B8** command looks like this:

```
^XA
^F050,50
^B8N,100,Y,N
^FD1234567^FS
^XZ
```

Notice that the **^B8** parameter letters have been replaced with real values that apply to the command. In this example **N,100,Y,N** have been entered.

A Comments section (if used) will show notes that are of value to a programmer, warnings of potential command interactions, or command-specific information that should be taken into consideration.

**Example:**

**This command works only when the printer is idle, or This command is ignored if a value exceeds the parameter limits.**

Comments are also included next to parameters if they apply directly to a particular setting.

## Basic ZPL Exercises and Examples

The purpose of these exercises is to introduce basic ZPL commands to novice ZPL users.

**Make sure this checklist is complete:**

- Load the printer with labels that are big enough to give you ample space to work with.
- Print a configuration label (CANCEL test).
- Look at the configuration label and make sure that the **LEFT POSITION** is set to **000** and **LABEL TOP** is set to **000**.
- Determine the printer's resolution. It is listed on the configuration label. **8/MM = 200 dpi**, **12/MM = 300 dpi** and **24/MM = 600 dpi**.

**Tips**

These are some tips when using ZPL:

- Use the DOS text editor to write ZPL files.
- Save the file as a **.txt** file and copy it to the printer from DOS command line.

## Before you begin

Some things that are important to understand before you begin are:

- 200 dpi means the resolution of the printhead is 200 dots per inch. If you program the printer to draw a line 100 dots long that equals a half inch. 100 dots on a 300 dpi printer prints a line 1/3 inch long.
- The home position that all your coordinates are referencing is at the left-hand trailing edge of the label as the label comes out of the printer. (There are some exceptions to this.)

## Exercises

The exercises start simple and gradually progress to give you an opportunity to try a variety of commonly used ZPL commands. Not all commands are covered, but this should be a good core of commands to learn. Some commands may not be supported due to the firmware version in your printer.

**Exercise 1 This exercise shows you how to specify a location for an entered name.**

1. Print your name on the label.
2. Start by printing just your name on the label. Use this format as a model:

**Important** • Your name goes where you see **xxxxxxxxxxxx** in the second line of code.

3. Send this format to the printer:

```

1 ─────────→ ^XA
2 ─────────→ ^FO50,50^ADN,36,20^FDxxxxxxxxxx
3 ─────────→ ^FS
4 ─────────→ ^XZ
      ↑
      5
  
```

<b>1</b>	Every format starts with the <b>^XA</b> command
<b>2</b>	<b>^FO</b> (field origin) command
<b>3</b>	<b>^FS</b> (field separator) command
<b>4</b>	Every format ends with the <b>^XZ</b> command
<b>5</b>	<b>^FD</b> (field data) command

4. When the label prints correctly, alter the first number after the **^FOx**. See how that change affects the print position. Alter the second number after the **^FO50,x** and see how that the print position.

**Font instruction**

**^ADN**

1. Alter the numbers after the **^ADN,x,x** command.
  - 18,10 is the smallest size you can make the **D** font.
  - The first number is the height of the font in dots. The second number is the width in dots.
  - You can use direct multiples up to ten times that size as a maximum.

**Example:** 180,100 is the largest you can make the **D** font.

- 25,18 would not be a valid size. The printer rounds to the next recognizable size.
2. Check the font matrices tables for other fonts to try. See *Fonts and Bar Codes on page 1309*.
  3. Try the zero scalable font **^A0N,x,x**.  
This font is scalable, and you can choose any height and width.

### Rotation Commands

1. Change `^ADN` to `^ADR`, and then `^ADI`, and then `^ADB`.  
See how the print position changes.
2. Add more fields.
3. Add two more fields to print directly under your name using the `^ADN, 36, 20` font and size:  
Your street address  
Your city, state, zip
4. You must add two more lines of code that start off with:  
`^XA`  
`^FO50, 50^ADN, 36, 20^FDxxxxxxxxxx^FS`  
`^FO (fill in the rest)`  
`^FO (fill in the rest)`  
`^XZ`

Make sure all these fields print in the same font and size and left side of fields has same vertical alignment.

Your name  
1200 W Main Street  
Anytown, IL 60061

### Special Effects commands

The Graphic Box or `^GB` command or is used in some of the speical effects commands.

#### Reverse Printing a Field

1. Write the following format and send to the printer:

```
^XA
^PR1
^FO100,100
^GB70,70,70,,3^FS
^FO200,100
^GB70,70,70,,3^FS
^FO300,100
^GB70,70,70,,3^FS
^FO400,100
^GB70,70,70,,3^FS
^FO107,110^CF0,70,93
^FR^FDREVERSE^FS
^XZ
```

2. To see the effects, remove:

```
^FR^FDREVERSE^FS
```

3. To see the effects, try removing one of the `^GB` lines of code.

### Label Reverse Print

1. Write the following format and send to the printer:

```
^XA^LRY  
^FO100,50  
^GB195,203,195^FS  
^FO180,110^CFG  
^FDLABEL^FS  
^FO130,170  
^FDREVERSE^FS  
^XZ
```

2. To see the effects, remove:

```
^GB195,203,195^FS
```

### Mirror Image of Label

1. Write the following format and send to the printer:

```
^XA^PMY  
^FO100,100  
^CFG  
^FDMIRROR^FS  
^FO100,160  
^FDIMAGE^FS  
^XZ
```

2. To see the effects, in the first line of code change `^PMY` to `^PMN`.

### Print Orientation

1. Write the following format and send to the printer:

```
^XA^CFD  
^POI  
^LH330,10  
^FO50,50  
^FDZEBRA TECHNOLOGIES^FS  
^FO50,75  
^FDVernon Hills, IL^FS  
^XZ
```

2. To see the effects, in the second line of code change `^POI` to `^PON`.

**Exercise 2 Boxes and lines**

1. Use the address format from [Exercise 1](#).
2. Add this new line to your existing format:  
`^F050,200^GB200,200,2^FS`  
 This prints a box one wide by one inch long and the thickness of the line is 2 dots.
3. Reposition and resize the square so that it goes around the name and address uniformly.
4. Print a line by adding:  
`^F050,300^GB400,1,4,^FS`  
 This prints a horizontal line two inches wide by 4 dots thick.
5. Print a vertical line using this code:  
`^F0100,50^GB1,400,4^FS`

**Exercise 3 Bar codes — ^B3 code 39 bar code**

1. Write the following format and send to the printer:  
`^XA  
^F050,50^B3N,N,100,Y,N^FD123456^FS  
^XZ`
2. Try changing each of the parameters in the `^B3` string so you can see the effects.  
`^B3o,e,h,f,g  
^BY`

**Important** • For valid parameter choices, see [^B3 on page 64](#).

3. Insert the `^BY` command just before the `^B3` to see how the narrow bar width can be altered.  
`^F050,50^BY2^B3..etc ^BYx, acceptable values for x are 1 through 10`
4. Alter the ratio of the narrow to wide bar.  
`^F050,50^BY2,3^B3..etc ^BY2,x acceptable values for x are 2.1 through 3 in .1 increments`
5. Print out a `^B3` bar code with the interpretation line on top of the bar code and the bar code rotated 90 degrees.

6. Add a `^PQ` just before the `^XZ` to print several labels.

```
^PQ4  
^XZ  
^PR Print rate (in inches per second)
```

7. Add a ^PR command after the ^XA at the beginning of the format to change the print rate (print speed).

`^XA`

`^PR4` then try `^PR6` `^PRx` acceptable values for x are 2 through 12 (check printer specs)

See how the print speed affects the print quality of the bar code. You may need to increase the printer darkness setting at higher print speeds.

#### Exercise 4    **^SN — Serial Number command**

1. Send this format to the printer:

`^XA`

`^FO100,100^ADN,36,20^SN001,1,Y^FS`

`^PQ3`

`^XZ`

To vary the `^SNv,n,z` to exercise increment/decrement and leading zeros functions, consult this guide.

If your serial number contains alpha and numeric characters, you can increment or decrement a specific segment of the data even if it is in the middle, as this sample sequence shows:

`ABCD1000EFGH, ABCD1001EFGH, ABCD1002EFGH`

2. Send this file to the printer and to see how it increments the serial number. The `^SF` command can also work with alpha characters.

`^XA`

`^FO100,100^ADN,36,20^FDABCD1000EFGH^SF%%%%ddd%%%%,10000^FS`

`^PQ15`

`^XZ`

Notice how the field data character position aligns with the `^SF` data string:

^	F	D	A	B	C	D	1	0	0	0	E	F	G	H
^	S	F	%	%	%	%	d	d	d	d	%	%	%	%
											1	0	0	0
											2	0	0	0
											3	0	0	0

And on through...

							1	0	1	4	0	0	0	0
--	--	--	--	--	--	--	---	---	---	---	---	---	---	---

The last label prints **ABCD1014EFGH**.

The % is placed in positions that you do not want to increment or decrement,  
`d` = decimal, `10000` = increment value.

For more details on `^SF`, see [^SF on page 331](#).

---

**Exercise 5 Saving a template to memory. ^IS and image save and image load.**

---

**Note** • This exercise helps you troubleshoot your code against the errors you see on your labels.

1. Send this format to the printer:

```
^XA  
^F020,30^GB750,1100,4^FS  
^F020,30^GB750,200,4^FS  
^F020,30^GB750,400,4^FS  
^F020,30^GB750,700,4^FS  
^F020,226^GB325,204,4^FS  
^F030,40^ADN,36,20^FDShip to:^FS  
^F030,260^ADN,18,10^FDPart number #^FS  
^F0360,260^ADN,18,10^FDDescription:^FS  
^F030,750^ADN,36,20^FDFrom:^FS  
^ISR:SAMPLE.GRF^FS  
^XZ
```

2. Send this format:

```
^XA  
^ILR:SAMPLE.GRF^FS  
^F0150,125^ADN,36,20^FDAcme Printing^FS  
^F060,330^ADN,36,20^FD14042^FS  
^F0400,330^ADN,36,20^FDscrew^FS  
^F070,480^BY4^B3N,,200^FD12345678^FS  
^F0150,800^ADN,36,20^FDMacks Fabricating^FS  
^XZ
```

In this way the template only needs to be sent one time to the printer's memory. Subsequent formats can be sent recalling the template and merging variable data into the template. In this exercise, the file was saved in the printers R: memory, which is volatile.

**Exercise 6 ^DF and ^XF — Download format and recall format**

Similar concept to ^IS and ^IL command. ^IS and ^IL processes faster in the printer than ^DF and ^XF.

This is how the ^DF and ^XF format structure produces a label similar to the ^IS/^IL sample you just tried.

**Figure 1 • Download and Recall Format**

<b>1</b>	Download format code
<b>2</b>	Recall format call that generates the generated label in <a href="#">Figure 1</a> .

**Exercise 7 Asian and Unicode Encodings****.14↑**

This exercise works in printers with firmware version V60.14, V50.14, or later.

In each of the following examples, the format is saved in the corresponding encoding before being sent down to the printer and the ZPL script was made in Microsoft Notepad, a basic text editor. The characters were inserted from the character map in Windows or typed from the keyboard.

**Example:** This is an example of using an Asian encoding, such as UHANGUL, with ASCII text. Using the **CI26** command tells the printer to recognize any byte less than **7F** as ASCII text and every byte above as the first byte of UHANGUAL encoding:

ZPL II CODE	GENERATED LABEL
<pre>^XA^CW1,B:ANMDK.TTF ^SEB:UHANGUL.DAT^CI26 ^FO100,100^A1,50,50^FDASCII 한글 ^FS ^XZ</pre>	ASCII한국어

**Example:** This is an example of using the Unicode encoding, UTF-8:

ZPL II CODE	GENERATED LABEL
<pre>^XA^CW1,ANMDJ.TTF^CI28 ^FO100,50^A1,30,30^FDENGLISH/日本語/한국어/简体中文/琅體中文^FS ^XZ</pre>	ENGLISH/日本語/한국어/简体中文/琅體中文

## Allowed Characters in File Names

Files on the internal printer drives (R:, E:, etc.) can be created or accessed using several different commands (for example, **^DF**, **^XF**, **^TO**, etc.). The names of the file can contain ONLY the characters shown in [Table 1](#).

Shaded areas indicate characters which cannot be used. The command and control characters (normally ^ and ~) cannot be used unless the control characters are changed to something else using the **^ACC~CC** ZPL command.

**Table 1 • Allowed characters in file names**

## ^A – Scalable/Bitmapped Font

The ^A command specifies the font to use in a text field. ^A designates the font for the current ^FD statement or field. The font specified by ^A is used only once for that ^FD entry. If a value for ^A is not specified again, the default ^CF font is used for the next ^FD entry.

### Format:

Parameter	Details
f = font name	<b>Values:</b> A through Z, and 0 to 9 Any font in the printer (downloaded, EPROM, stored fonts, fonts A through Z and 0 to 9).
o = field orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> the last accepted ^FW value or the ^FW default
h = Character Height (in dots)	<b>Scalable</b> <b>Values:</b> 10 to 32000 <b>Default:</b> last accepted ^CF <b>Bitmapped</b> <b>Values:</b> multiples of height from 1 to 10 times the standard height, in increments of 1 <b>Default:</b> last accepted ^CF
w = width (in dots)	<b>Scalable</b> <b>Values:</b> 10 to 32000 <b>Default:</b> last accepted ^CF <b>Bitmapped</b> <b>Values:</b> multiples of width from 1 to 10 times the standard width, in increments of 1 <b>Default:</b> last accepted ^CF

**Important** • Parameter **f** is required. If **f** is omitted it defaults to the last value of the ^CF command.

### Scalable Font Command

→ **Example:** This is an example of a scalable font command:

ZPL II Code	Generated Label
<pre>^XA ^FO50,50 ^A0,32,25 ^FDZEBRA^FS ^FO50,150 ^A0,32,25 ^FDPROGRAMMING^FS ^FO50,250 ^A0,32,25^FDLANGUAGE^FS</pre>	<p>ZEBRA</p> <p>PROGRAMMING</p> <p>LANGUAGE</p>

### Bitmap Font Command

→ **Example:** This is an example of a bitmap font command:

ZPL II Code	Generated Label
<pre>^XA ^FO50,50 ^ADN,36,20 ^FDZEBRA^FS ^FO50,150 ^ADN,36,20 ^FDPROGRAMMING^FS ^FO50,250 ^ADN,36,20^FDLANGUAGE^FS</pre>	<p>ZEBRA</p> <p>PROGRAMMING</p> <p>LANGUAGE</p>

For reference, see [Standard Printer Fonts on page 1310](#), [Zebra Code Page 850 — Latin Character Set on page 1294](#), [Fonts and Bar Codes on page 1309](#), and [ASCII on page 1307](#).

**Comments** Fonts are built using a matrix that defines standard height-to-width ratios. If you specify only the height or width value, the standard matrix for that font automatically determines the other value. If the value is not given or a 0 (zero) is entered, the height or width is determined by the standard font matrix.

.14↑

This command interacts with the justification parameters of `^FO` and `^FT` and with the field direction parameter of `^FP`. For output and examples, see [Field Interactions on page 1341](#).

## ^A@ – Use Font Name to Call Font

The ^A@ command uses the complete name of a font, rather than the character designation used in ^A. Once a value for ^A@ is defined, it represents that font until a new font name is specified by ^A@.

---

**Format:** ^A@o,h,w,d:f.x

Parameter	Details
<b>o</b> = field orientation	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>N = normal</li> <li>R = rotates 90 degrees (clockwise)</li> <li>I = inverted 180 degrees</li> <li>B = read from bottom up, 270 degrees</li> </ul> <p><b>Default:</b> N or the last ^FW value</p>
<b>h</b> = character height (in dots)	<p><b>Default:</b></p> <p>Specifies magnification by <b>w</b> (character width) or the last accepted ^CF value. Uses the base height if none is specified.</p> <ul style="list-style-type: none"> <li>• Scalable The value is the height in dots of the entire character block. Magnification factors are unnecessary, because characters are scaled.</li> <li>• Bitmapped The value is rounded to the nearest integer multiple of the font's base height, then divided by the font's base height to give a magnification nearest limit.</li> </ul>
<b>w</b> = width (in dots)	<p><b>Default:</b> Specifies magnification by <b>h</b> (height) or the last accepted ^CF value. Specifies the base width is used if none is specified.</p> <ul style="list-style-type: none"> <li>• Scalable The value is the width in dots of the entire character block. Magnification factors are unnecessary, because characters are scaled.</li> <li>• Bitmapped The value rounds to the nearest integer multiple of the font's base width, then divided by the font's base width to give a magnification nearest limit.</li> </ul>
<b>d</b> = drive location of font	<p><b>Values:</b> R:, E:, B:, and A:</p> <p><b>Default:</b> R:</p>
<b>f</b> = font name	<p><b>Values:</b> any valid font</p> <p><b>Default:</b> if an invalid or no name is entered, the default set by ^CF is used If no font has been specified in ^CF, font A is used.</p> <p>The font named carries over on all subsequent ^A@ commands without a font name.</p>

**Format:** ^A@o,h,w,d:f.x

Parameter	Details
x = extension  .141  .TTE is only supported in firmware version V60.14.x, V50.14.x, or later.	<b>Values:</b> .FNT = font .TTF = TrueType Font .TTE = TrueType Extension

**Example:** This example identifies the purpose of each line of code for this label:

ZPL II Code	Generated Label
1→ ^XA 2→ ^A2N,50,50,B:CYRI_UB.FNT 3→ ^F0100,100 4→ ^FD <i>Zebra Printer Fonts</i> ^FS 5→ ^A2N,40,40 6→ ^F0100,150 7→ ^FD <i>This uses B:CYRI_UB.FNT</i> ^FS 8→ ^XZ	<b>Zebra Printer Fonts</b> <i>This uses B:CYRI_UB.FNT</i>

1	Starts the label format.
2	Searches non-volatile printer memory (B:) for <b>CYRI_UB.FNT</b> . When the font is found, the ^A@ command sets the print orientation to normal and the character size to 50 dots by 50 dots.
3	Sets the field origin at 100,100.
4	Prints the field data, <i>Zebra Printer Fonts</i> on the label.
5	Calls the font again and character size is decreased to 40 dots by 40 dots.
6	Sets the new field origin at 100,150.
7	Prints the field data, <i>This uses the B:CYRI_UB.FNT</i> on the label.
8	Ends the label format.

For reference, see [Zebra Code Page 850 — Latin Character Set](#) on page 1294, [Fonts and Bar Codes](#) on page 1309, and [ASCII](#) on page 1307.

## ^B0 – Aztec Bar Code Parameters

The ^B0 command creates a two-dimensional matrix symbology made up of square modules arranged around a bulls-eye pattern at the center.

**Note** • The Aztec bar code works with firmware version V60.13.0.11A and V50.13.2 or later.

**Format:** ^B0a,b,c,d,e,f,g

Parameters	Details
a = orientation	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>N = normal</li> <li>R = rotated</li> <li>I = inverted 180 degrees</li> <li>B = read from bottom up, 270 degrees</li> </ul> <p><b>Default:</b> current ^FW value</p>
b = magnification factor	<p><b>Values:</b> 1 to 10</p> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>1 on 150 dpi printers</li> <li>2 on 200 dpi printers</li> <li>3 on 300 dpi printers</li> <li>6 on 600 dpi printers</li> </ul>
c = extended channel interpretation code indicator	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>Y = if data contains ECICs</li> <li>N = if data does not contain ECICs</li> </ul> <p><b>Default:</b> N</p>
d = error control and symbol size/type indicator	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>0 = default error correction level</li> <li>01 to 99 = error correction percentage (minimum)</li> <li>101 to 104 = 1 to 4-layer compact symbol</li> <li>201 to 232 = 1 to 32-layer full-range symbol</li> <li>300 = a simple Aztec “Rune”</li> </ul> <p><b>Default:</b> 0</p>
e = menu symbol indicator	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>Y = if this symbol is to be a menu (bar code reader initialization) symbol</li> <li>N = if it is not a menu symbol</li> </ul> <p><b>Default:</b> N</p>
f = number of symbols for structured append	<p><b>Values:</b> 1 through 26</p> <p><b>Default:</b> 1</p>

Parameters	Details
<i>g</i> = optional ID field for structured append	The ID field is a text string with 24-character maximum <b>Default:</b> no ID

→ **Example:** This is an example of the ^B0 command:

## ^B1 – Code 11 Bar Code

The ^B1 command produces the Code 11 bar code, also known as USD-8 code. In a Code 11 bar code, each character is composed of three bars and two spaces, and the character set includes 10 digits and the hyphen (-).

- ^B1 supports print ratios of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the Code 11 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^B1o,e,h,f,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>e</b> = check digit	<b>Values:</b> Y = 1 digit N = 2 digits <b>Default:</b> N
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> Value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> Y = yes N = no <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> Y = yes N = no <b>Default:</b> N

**Example:** This is an example of the Code 11 bar code:

ZPL II CODE	CODE 11 BAR CODE									
<pre>^XA ^FO100,100^BY3 ^B1N,N,150,Y,N ^FD123456^FS ^XZ</pre>	 △12345611△

△△ is used with 2 check digits										

## ^B2 – Interleaved 2 of 5 Bar Code

The ^B2 command produces the Interleaved 2 of 5 bar code, a high-density, self-checking, continuous, numeric symbology.

Each data character for the Interleaved 2 of 5 bar code is composed of five elements: five bars or five spaces. Of the five elements, two are wide and three are narrow. The bar code is formed by interleaving characters formed with all spaces into characters formed with all bars.

- ^B2 supports print ratios of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the Interleaved 2 of 5 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^B2o,h,f,g,e,j

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> Y = yes N = no <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> Y = yes N = no <b>Default:</b> N
<b>e</b> = calculate and print Mod 10 check digit	<b>Values:</b> Y = yes N = no <b>Default:</b> N

**Example:** This is an example of an Interleaved 2 of 5 bar code:

ZPL II CODE	INTERLEAVED 2 OF 5 BAR CODE
<pre>^XA ^FO100,100^BY3 ^B2N,150,Y,N,N ^FD123456^FS ^XZ</pre>	 123456
INTERLEAVED 2 OF 5 BAR CODE CHARACTERS	
0	1
2	3
4	5
6	7
8	9
Start/Stop (internal)	

**Comments** The total number of digits in an Interleaved 2 of 5 bar code must be even. The printer automatically adds a leading 0 (zero) if an odd number of digits is received.

The Interleaved 2 of 5 bar code uses the Mod 10 check-digit scheme for error checking. For more information on Mod 10 check digits, see [Mod 10 Check Digit](#) on page 1323.

## ^B3 – Code 39 Bar Code

The Code 39 bar code is the standard for many industries, including the U.S. Department of Defense. It is one of three symbologies identified in the American National Standards Institute (ANSI) standard MH10.8M-1983. Code 39 is also known as USD-3 Code and 3 of 9 Code.

Each character in a Code 39 bar code is composed of nine elements: five bars, four spaces, and an inter-character gap. Three of the nine elements are wide; the six remaining elements are narrow.

- ^B3 supports print ratios of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.
- Code 39 automatically generates the start and stop character (\*).
- Asterisk (\*) for start and stop character prints in the interpretation line, if the interpretation line is turned on.
- Code 39 is capable of encoding the full 128-character ASCII set.

**Important** • If additional information about the Code 39 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^B3o,e,h,f,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>e</b> = Mod-43 check digit	<b>Values:</b> Y = yes N = no <b>Default:</b> N
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> Y = yes N = no <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> Y = yes N = no <b>Default:</b> N

**Example 1:** This is an example of a Code 39 bar code:

ZPL II CODE	CODE 39 BAR CODE
<pre>^XA ^FO100,100^BY3 ^B3N,N,100,Y,N ^FD123ABC^FS ^XZ</pre>	 *123ABC*
CODE 39 BAR CODE CHARACTERS	
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z	0 1 2 3 4 5 6 7 8 9 - . \$ / + % Space

**Comments** Extended ASCII is a function of the scanner, not of the bar code. Your scanner must have extended ASCII enabled for this feature to work. To enable extended ASCII in the Code 39, you must first encode +\$ in your ^FD statement. To disable extended ASCII, you must encode -\$ in your ^FD statement.

**Example 2:** This example encodes a carriage return with line feed into a Code 39 bar code:

ZPL II CODE	GENERATED LABELS
<pre>^XA ^FO20,20 ^B3N,N,100,Y ^FDTEST+\$+\$M\$J-\$^FS ^XZ</pre>	 *TEST+\$+\$M\$J-\$*

### Full ASCII Mode for Code 39

Code 39 can generate the full 128-character ASCII set using paired characters as shown in these tables:

## ^B4 – Code 49 Bar Code

The ^B4 command creates a multi-row, continuous, variable-length symbology capable of encoding the full 128-character ASCII set. It is ideally suited for applications requiring large amounts of data in a small space.

The code consists of two to eight rows. A row consists of a leading quiet zone, four symbol characters encoding eight code characters, a stop pattern, and a trailing quiet zone. A separator bar with a height of one module separates each row. Each symbol character encodes two characters from a set of Code 49 characters.

- ^B4 has a fixed print ratio.
- Rows can be scanned in any order.

**Important** • For additional information about the Code 49 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^B4o,h,f,m

Parameters	Details
<b>o</b> = orientation	<p><b>Values:</b></p> <p>N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees</p> <p><b>Default:</b> current ^FW value</p>
<b>h</b> = height multiplier of individual rows	<p><b>Values:</b> 1 to height of label <b>Default:</b> value set by ^BY</p> <p>This number multiplied by the module equals the height of the individual rows in dots. 1 is not a recommended value.</p>
<b>f</b> = print interpretation line	<p><b>Values:</b></p> <p>N = no line printed A = print interpretation line above code B = print interpretation line below code</p> <p><b>Default:</b> N</p> <p>When the field data exceeds two rows, expect the interpretation line to extend beyond the right edge of the bar code symbol.</p>

Parameters	Details
m = starting mode	<p><b>Values:</b></p> <ul style="list-style-type: none"><li>0 = Regular Alphanumeric Mode</li><li>1 = Multiple Read Alphanumeric</li><li>2 = Regular Numeric Mode</li><li>3 = Group Alphanumeric Mode</li><li>4 = Regular Alphanumeric Shift 1</li><li>5 = Regular Alphanumeric Shift 2</li><li>A = Automatic Mode. The printer determines the starting mode by analyzing the field data.</li></ul> <p><b>Default: A</b></p>

→ **Example 1:** This is an example of a Code 49 bar code:

<b>Code 49 Shift 1 and 2 Character Substitutions</b>			

### Code 49 Field Data Character Set

The ^FD data sent to the printer when using starting modes 0 to 5 is based on the Code 49 Internal Character Set. This is shown in the first column of the Code 49 table on the previous page. These characters are Code 49 control characters:

: ; < = > ?

Valid field data must be supplied when using modes 0 to 5. Shifted characters are sent as a two-character sequence of a shift character followed by a character in the unshifted character set.

**Example 2:** To encode a lowercase **a**, send **a >** (Shift 2) followed by an uppercase **A**. If interpretation line printing is selected, a lowercase *a* prints in the interpretation line. This reflects what the output from the scanner reads. Code 49 uses uppercase alphanumeric characters only.

If an invalid sequence is detected, the Code 49 formatter stops interpreting field data and prints a symbol with the data up to the invalid sequence. These are examples of invalid sequences:

- Terminating numeric mode with any characters other than 0 to 9 or a Numeric Space.
- Starting in Mode 4 (Regular Alphanumeric Shift 1) and the first field data character is not in the Shift 1 set.
- Starting in Mode 5 (Regular Alphanumeric Shift 2) and the first field data character is not in the Shift 2 set.
- Sending Shift 1 followed by a character not in the Shift 1 set.
- Sending Shift 2 followed by a character not in the Shift 2 set.
- Sending two Shift 1 or Shift 2 control characters.

### Advantages of Using the Code 49 Automatic Mode

Using the default (Automatic Mode) completely eliminates the need for selecting the starting mode or manually performing character shifts. The Automatic Mode analyzes the incoming ASCII string, determines the proper mode, performs all character shifts, and compacts the data for maximum efficiency.

Numeric Mode is selected or shifted only when five or more continuous digits are found. Numeric packaging provides no space advantage for numeric strings consisting of fewer than eight characters.

## ^B5 – Planet Code bar code

The ^B5 command is supported in all printers as a resident bar code.

**Note** • Accepted bar code characters are 0 - 9.

**Format:** ^B5o,h,f,g

Parameters	Details
<b>o</b> = orientation code	<b>Values:</b> N = normal R = rotated I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 9999 <b>Default:</b> value set by ^BY
<b>f</b> = interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>g</b> = determines if the interpretation line is printed above the bar code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

**Example:** This is an example of a Planet Code bar code:

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^FO150,100^BY3 ^B5N,100,Y,N ^FD12345678901^FS ^XZ </pre>	

## ^B7 – PDF417 Bar Code

The ^B7 command produces the PDF417 bar code, a two-dimensional, multirow, continuous, stacked symbology. PDF417 is capable of encoding over 1,000 characters per bar code. It is ideally suited for applications requiring large amounts of information at the time the bar code is read.

The bar code consists of three to 90 stacked rows. Each row consists of start and stop patterns and symbol characters called *code-words*. A code-word consists of four bars and four spaces. A three code-word minimum is required per row.

The PDF417 bar code is also capable of using the structured append option (^FM), which allows you to extend the field data limitations by printing multiple bar codes. For more information on using structured append, see [^FM on page 191](#).

- PDF417 has a fixed print ratio.
- Field data (^FD) is limited to 3K of character data.

**Format:** ^B7o,h,s,c,r,t

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height for individual rows (in dots)	<b>Values:</b> 1 to height of label <b>Default:</b> value set by ^BY This number multiplied by the module equals the height of the individual rows in dots. If this number is not specified, the overall bar code height, divided by the number of rows, equals the height of the individual rows in dots, where the overall bar code height is defined by the ^BY command. 1 is not a recommended value.
<b>s</b> = security level	<b>Values:</b> 1 to 8 (error detection and correction) <b>Default:</b> 0 (error detection only) This determines the number of error detection and correction code-words to be generated for the symbol. The default level provides only error detection without correction. Increasing the security level adds increasing levels of error correction and increases the symbol size.
<b>c</b> = number of data columns to encode	<b>Values:</b> 1 to 30 <b>Default:</b> 1:2 (row-to-column aspect ratio) You can specify the number of code-word columns giving control over the width of the symbol.

Parameters	Details
<b>r</b> = number of rows to encode	<p><b>Values:</b> 3 to 90  <b>Default:</b> 1:2 (row-to-column aspect ratio)</p> <p>You can specify the number of symbol rows giving control over the height of the symbol. For example, with no row or column values entered, 72 code-words would be encoded into a symbol of six columns and 12 rows. Depending on code-words, the aspect ratio is not always exact.</p>
<b>t</b> = truncate right row indicators and stop pattern	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>N</b> = no truncation</li> <li><b>Y</b> = perform truncation</li> </ul> <p><b>Default:</b> N</p>

**Example 1:** This is an example of a PDF417 bar code:

ZPL II CODE	PDF417 BAR CODE
<pre> ^XA ^BY2,3 ^FO10,10^B7N,5,5,,83,N ^FDZebra Technologies Corporation strives to be the expert supplier of innovative solutions to speciality demand labeling and ticketing problems of business and government. We will attract and retain the best people who will understand our customer's needs and provide them with systems, hardware, software, consumables and service offering the best value, high quality, and reliable performance, all delivered in a timely manner. ^FS^XZ </pre>	

→ **Example 2:** This is an example of a PDF417 without and with truncation selected:

PDF417 without Truncation being selected

PDF417 with Truncation being selected

→ **Example 3:** This example shows the ^B7 command used with field hex (^FH) characters:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO50,50^BY3,3.0^B7N,8,5,7,21,N ^FH_&gt;_1E06_1DP12345678_1DQ160 _1D1JUN123456789A2B4C6D8E_1D20LA6-987 _1D21L54321_ZES_1D15KG1155 _1DBSC151208_1D7Q10GT_1E_04^FS ^XZ</pre>	

**Comments** Noted in this bulleted list:

- If both columns and rows are specified, their product must be less than 928.
- No symbol is printed if the product of columns and rows is greater than 928.
- No symbol is printed if total code-words are greater than the product of columns and rows.
- Serialization is not allowed with this bar code.
- The truncation feature can be used in situations where label damage is not likely. The right row indicators and stop pattern is reduced to a single module bar width. The difference between a non truncated and a truncated bar code is shown in the previous examples.

## Special Considerations for ^BY When Using PDF417

When used with ^B7, the parameters for the ^BY command are:

**w = module width (in dots)**

**Values:** 2 to 10

**Default:** 2

**r = ratio**

**Fixed Value:** 3 (ratio has no effect on PDF417)

**h = height of bars (in dots)**

**Values:** 1 to 32000

**Default:** 10

PDF417 uses this only when row height is not specified in the ^B7 h parameter.

## Special Considerations for ^FD When Using PDF417

The character set sent to the printer with the ^FD command includes the full ASCII set, except for those characters with special meaning to the printer.

See [Zebra Code Page 850 — Latin Character Set on page 1294](#), [^CC ~CC on page 146](#), and [^CT ~CT on page 159](#).

- CR and LF are also valid characters for all ^FD statements. This scheme is used:  
**\&** = carriage return/line feed  
**\\"** = backslash (\)
- ^CI13 must be selected to print a backslash (\).

## ^B8 – EAN-8 Bar Code

The ^B8 command is the shortened version of the EAN-13 bar code. EAN is an acronym for European Article Numbering. Each character in the EAN-8 bar code is composed of four elements: two bars and two spaces.

- ^B8 supports a fixed ratio.
- Field data (^FD) is limited to exactly seven characters. ZPL II automatically pads or truncates on the left with zeros to achieve the required number of characters.
- When using JAN-8 (Japanese Article Numbering), a specialized application of EAN-8, the first two non-zero digits sent to the printer are always 49.

**Important** • If additional information about the EAN-8 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^B8o,h,f,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

**Example:** This is an example of an EAN-8 bar code:

ZPL II CODE	EAN-8 BAR CODE								
<pre>^XA ^FO100,100^BY3 ^B8N,100,Y,N ^FD1234567^FS ^XZ</pre>	 1234 5670								
EAN-8 BAR CODE CHARACTERS									
0	1	2	3	4	5	6	7	8	9

## ^B9 – UPC-E Bar Code

The ^B9 command produces a variation of the UPC symbology used for number system 0. It is a shortened version of the UPC-A bar code, where zeros are suppressed, resulting in codes that require less printing space. The 6 dot/mm, 12 dot/mm, and 24 dot/mm printheads produce the UPC and EAN symbologies at 100 percent of their size. However, an 8 dot/mm printhead produces the UPC and EAN symbologies at a magnification factor of 77 percent.

Each character in a UPC-E bar code is composed of four elements: two bars and two spaces. The ^BY command must be used to specify the width of the narrow bar.

- ^B9 supports a fixed ratio.
- Field data (^FD) is limited to exactly 10 characters, requiring a five-digit manufacturer's code and five-digit product code.
- When using the zero-suppressed versions of UPC, you must enter the full 10-character sequence. ZPL II calculates and prints the shortened version.

**Important** • If additional information about the UPC-E bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^B9,h,f,g,e

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>e</b> = print check digit	<b>Values:</b> N = no Y = yes <b>Default:</b> Y

**Example:** This is an example of a UPC-E bar code:

ZPL II CODE	UPC-E BAR CODE								
<pre>^XA ^FO150,100^BY3 ^B9N,100,Y,N,Y ^FD123000045^FS ^XZ</pre>	 0 1 2 3 4 5 3 1								
UPC-E BAR CODE CHARACTERS									
0	1	2	3	4	5	6	7	8	9

### Rules for Proper Product Code Numbers

- If the last three digits in the manufacturer's number are 000, 100, or 200, valid product code numbers are 00000 to 00999.
- If the last three digits in the manufacturer's number are 300, 400, 500, 600, 700, 800, or 900, valid product code numbers are 00000 to 00099.
- If the last two digits in the manufacturer's number are 10, 20, 30, 40, 50, 60, 70, 80, or 90, valid product code numbers are 00000 to 00009.
- If the manufacturer's number does not end in zero (0), valid product code numbers are 00005 to 00009.

## ^BA – Code 93 Bar Code

The ^BA command creates a variable length, continuous symbology. The Code 93 bar code is used in many of the same applications as Code 39. It uses the full 128-character ASCII set. ZPL II, however, does not support ASCII control codes or escape sequences. It uses the substitute characters shown below.

Control Code	ZPL II Substitute
Ctrl \$	&
Ctrl %	'
Ctrl /	(
Ctrl +	)

Each character in the Code 93 bar code is composed of six elements: three bars and three spaces. Although invoked differently, the human-readable interpretation line prints as though the control code has been used.

- ^BA supports a fixed print ratio.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the Code 93 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BAo,h,f,g,e

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

Parameters	Details
e = print check digit	<b>Values:</b> N = no Y = yes <b>Default:</b> N

**Example:** This is an example of a Code 93 bar code:

ZPL II CODE	CODE 93 BAR CODE
<code>^XA ^FO100,75^BY3 ^BAN,100,Y,N,N ^FD12345ABCDE^FS ^XZ</code>	 012345ABCDE
CODE 93 BAR CODE CHARACTERS	
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z - . \$ / + % & , ( ) SPACE	0 1 2 3 4 5 6 7 8 9

**□ Denotes an internal start/stop character that must precede and follow every bar code message.**

**Comments** All control codes are used in pairs. Code 93 is also capable of encoding the full 128-character ASCII set.

## Full ASCII Mode for Code 93

Code 93 can generate the full 128-character ASCII set using paired characters as shown in the following tables.

Table 5 •

ASCII	Code 93	ASCII	Code 93

## ^BB – CODABLOCK Bar Code

The ^BB command produces a two-dimensional, multirow, stacked symbology. It is ideally suited for applications that require large amounts of information.

Depending on the mode selected, the code consists of one to 44 stacked rows. Each row begins and ends with a start and stop pattern.

- CODABLOCK A supports variable print ratios.
- CODABLOCK E and F support only fixed print ratios.

**Important** • If additional information about the CODABLOCK bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BBo,h,s,c,r,m

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> N
<b>h</b> = bar code height for individual rows (in dots)	<b>Values:</b> 2 to 32000 <b>Default:</b> 8 This number, multiplied by the module, equals the height of the individual row in dots.
<b>s</b> = security level	<b>Values:</b> N = no Y = yes <b>Default:</b> Y Security level determines whether symbol check-sums are generated and added to the symbol. Check sums are never generated for single-row symbols. This can be turned off only if parameter <b>m</b> is set to A.
<b>c</b> = number of characters per row (data columns)	<b>Values:</b> 2 to 62 characters This is used to encode a CODABLOCK symbol. It gives you control over the width of the symbol.

Parameters	Details
<b>r</b> = number of rows to encode	<b>Values:</b> for CODABLOCK A: <b>1 to 22</b> for CODABLOCK E and F: <b>2 to 4</b> <ul style="list-style-type: none"><li>• If values for c and r are not specified, a single row is produced.</li><li>• If a value for r is not specified, and c exceeds the maximum range, a single row equal to the field data length is produced.</li><li>• If a value for c is not specified, the number of characters per row is derived by dividing the field data by the value of r.</li><li>• If the s parameter is set to the default of Y, then the checksum characters that are included count as two data characters .</li></ul> <p>For example, if c = 6, r is set to 3 and s is set to N, then up to 18 characters can be used (<math>6 \times 3</math>). However, if s is set to Y, then only 16 character can be used.</p> <ul style="list-style-type: none"><li>• If the data field contains primarily numeric data, fewer than the specified rows might be printed. If the field data contains several shift and code-switch characters, more than the specified number of rows might be printed.</li></ul>
<b>m</b> = mode	<b>Values:</b> <b>A, E, F</b> CODABLOCK A uses the Code 39 character set. CODABLOCK F uses the Code 128 character set. CODABLOCK E uses the Code 128 character set and automatically adds FNC1. <b>Default:</b> <b>F</b>

**Example:** This is an example of a CODABLOCK bar code:

ZPL II CODE	CODABLOCK BAR CODE
<pre>^XA ^BY2,3 ^FO10,10^BBN,30,,30,44,E ^FDZebra Technologies Corporation strives to be the expert supplier of innovative solutions to speciality demand labeling and ticketing problems of business and government. We will attract and retain the best people who will understand our customer's needs and provide them with systems, hardware, software, consumables and service offering the best value, high quality, and reliable performance, all delivered in a timely manner.^FS ^XZ</pre>	

### Special Considerations for the ^BY Command When Using ^BB

The parameters for the ^BYw,r,h command, when used with a ^BB code, are as follows:

**w = module width (in dots)**

**Values:** 2 to 10 (CODABLOCK A only)

**Default:** 2

**r = ratio**

**Fixed Value:** 3 (ratio has no effect on CODABLOCK E or F)

**h = height of bars (in dots)**

**Values:** 1 to 32,32000

**Default:** 10

CODABLOCK uses this as the overall symbol height only when the row height is not specified in the ^BB h parameter.

## Special Considerations for ^FD Character Set When Using ^BB

The character set sent to the printer depends on the mode selected in parameter m.

**CODABLOCK A:** CODABLOCK A uses the same character set as Code 39. If any other character is used in the ^FD statement, either no bar code is printed or an error message is printed (if ^CV is active).

**CODABLOCK E:** The Automatic Mode includes the full ASCII set except for those characters with special meaning to the printer. Function codes or the Code 128 Subset A <nul> character can be inserted using of the ^FH command.

<fnc1> = 80 hex	<fnc3> = 82 hex
<fnc2> = 81 hex	<fnc4> = 83 hex
<nul> = 84 hex	

For any other character above 84 hex, either no bar code is printed or an error message is printed (if ^CV is active).

**CODABLOCK F:** CODABLOCK F uses the full ASCII set, except for those characters with special meaning to the printer. Function codes or the Code 128 Subset A <nul> character can be inserted using of the ^FH command.

<fnc1> = 80 hex	<fnc3> = 82 hex
<fnc2> = 81 hex	<fnc4> = 83 hex
<nul> = 84 hex	

## ^BC – Code 128 Bar Code (Subsets A, B, and C)

The ^BC command creates the Code 128 bar code, a high-density, variable length, continuous, alphanumeric symbology. It was designed for complexly encoded product identification.

Code 128 has three subsets of characters. There are 106 encoded printing characters in each set, and each character can have up to three different meanings, depending on the character subset being used. Each Code 128 character consists of six elements: three bars and three spaces.

- ^BC supports a fixed print ratio.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the Code 128 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BCo,h,f,g,e,m

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> Y (yes) or N (no) <b>Default:</b> Y The interpretation line can be printed in any font by placing the font command before the bar code command.
<b>g</b> = print interpretation line above code	<b>Values:</b> Y (yes) or N (no) <b>Default:</b> N
<b>e</b> = UCC check digit	<b>Values:</b> Y (turns on) or N (turns off) Mod 103 check digit is always there. It cannot be turned on or off. Mod 10 and 103 appear together with e turned on. <b>Default:</b> N

Parameters	Details
<b>m = mode</b>	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>N</b> = no selected mode</li> <li><b>U</b> = UCC Case Mode <ul style="list-style-type: none"> <li>• More than 19 digits in <b>^FD</b> or <b>^SN</b> are eliminated.</li> <li>• Fewer than 19 digits in <b>^FD</b> or <b>^SN</b> add zeros to the right to bring the count to 19. This produces an invalid interpretation line.</li> </ul> </li> <li><b>A</b> = Automatic Mode <ul style="list-style-type: none"> <li>This analyzes the data sent and automatically determines the best packing method. The full ASCII character set can be used in the <b>^FD</b> statement — the printer determines when to shift subsets. A string of four or more numeric digits causes an automatic shift to Subset C.</li> </ul> </li> <li><b>D</b> = UCC/EAN Mode (x.11.x and newer firmware) <ul style="list-style-type: none"> <li>This allows dealing with UCC/EAN with and without chained application identifiers. The code starts in the appropriate subset followed by FNC1 to indicate a UCC/EAN 128 bar code. The printer automatically strips out parentheses and spaces for encoding, but prints them in the human-readable section. The printer automatically determines if a check digit is required, calculate it, and print it.</li> <li>Automatically sizes the human readable.</li> </ul> </li> </ul> <p><b>Default:</b> N</p>

**Example 1:** This is an example of a Code 128 bar code:

ZPL II CODE	CODE 128 BAR CODE
<pre> ^XA ^FO100,100^BY3 ^BCN,100,Y,N,N ^FD123456^FS ^XZ </pre>	<p>123456</p>

## Code 128 Subsets

The Code 128 character subsets are referred to as Subset A, Subset B, and Subset C. A subset can be selected in these ways:

- A special Invocation Code can be included in the field data (^FD) string associated with that bar code.
- The desired Start Code can be placed at the beginning of the field data. If no Start Code is entered, Subset B are used.

To change subsets within a bar code, place the Invocation Code at the appropriate points within the field data (^FD) string. The new subset stays in effect until changed with the Invocation Code. For example, in Subset C, >7 in the field data changes the Subset to A.

[Table 7](#) shows the Code 128 Invocation Codes and Start Characters for the three subsets.

**Table 7 • Code 128 Invocation Characters**

Invocation Code	Decimal Value	Subset A Character	Subset B Character	Subset C Character
><	62

49	Q	Q	49	102	FNC1	FNC1	FNC1
50	R	R	50	103	<i>START (Code A)</i>		
51	S	S	51	104	<i>START (Code B)</i>		
52	T	T	52	105	<i>START (Code C)</i>		

→ **Example 2:** Figures A and B are examples of identical bar codes, and Figure C is an example of switching from Subset C to B to A, as follows:

Because Code 128 Subset B is the most commonly used subset, ZPL II defaults to Subset B if no start character is specified in the data string.

## How ^BC Works Within a ZPL II Script

**^XA** – the first command starts the label format.

**^FO100,75** – the second command sets the field origin at 100 dots across the x-axis and 75 dots down the y-axis from the upper-left corner.

**^BCN,100,Y,N,N** – the third command calls for a Code 128 bar code to be printed with no rotation (N) and a height of 100 dots. An interpretation line is printed (Y) below the bar code (N). No UCC check digit is used (N).

**^FDCODE128^FS** (Figure A) **^FD>:CODE128^FS** (Figure B) – the field data command specifies the content of the bar code.

**^XZ** – the last command ends the field data and indicates the end of the label.

The interpretation line prints below the code with the UCC check digit turned off.

The ^FD command for Figure A does not specify any subset, so Subset B is used. In Figure B, the ^FD command specifically calls Subset B with the >: Start Code. Although ZPL II defaults to Code B, it is good practice to include the Invocation Codes in the command.

Code 128 – Subset B is programmed directly as ASCII text, except for values greater than 94 decimal and a few special characters that must be programmed using the invocation codes. Those characters are:

^ > ~

### Example 3: Code 128 – Subsets A and C

Code 128, Subsets A and C are programmed in pairs of digits, 00 to 99, in the field data string. For details, see [Table 7 on page 91](#).

In Subset A, each pair of digits results in a single character being encoded in the bar code; in Subset C, characters are printed as entered. Figure E below is an example of Subset A (>9 is the Start Code for Subset A).

Nonintegers programmed as the first character of a digit pair (D2) are ignored. However, nonintegers programmed as the second character of a digit pair (2D) invalidate the entire digit pair, and the pair is ignored. An extra unpaired digit in the field data string just before a code shift is also ignored.

Figure D and Figure E below are examples of Subset C. Notice that the bar codes are identical. In the program code for Figure F, the D is ignored and the 2 is paired with the 4.

<pre><code>^XA ^FO100,75^BY3 ^BCN,100,Y,N,N ^FD&gt;;382436^FS ^XZ</code></pre>	 <b>382436</b>
<b>Figure D: Subset C with normal data</b>	

<pre><code>^XA ^FO100,75^BY3 ^BCN,100,Y,N,N ^FD&gt;;38D2436^FS ^XZ</code></pre>	 <b>382436</b>
<b>Figure E: Subset C with ignored alpha character</b>	

<pre><code>^XA ^FO100,75^BY3 ^BCN,100,Y,N,N ^FD&gt;935473637171824^FS ^XZ</code></pre>	 <b>CODE128</b>
<b>Figure F: Subset A</b>	

## The UCC/EAN-128 Symbology

The symbology specified for the representation of Application Identifier data is UCC/EAN-128, a variant of Code 128, exclusively reserved to EAN International and the Uniform Code Council (UCC).

**Note** • It is not intended to be used for data to be scanned at the point of sales in retail outlets.

UCC/EAN-128 offers several advantages. It is one of the most complete, alphanumeric, one-dimensional symbologies available today. The use of three different character sets (A, B and C), facilitates the encoding of the full 128 ASCII character set. Code 128 is one of the most compact linear bar code symbologies. Character set C enables numeric data to be represented in a double density mode. In this mode, two digits are represented by only one symbol character saving valuable space. The code is concatenated. That means that multiple AIs and their fields may be combined into a single bar code. The code is also very reliable. Code 128 symbols use two independent self-checking features which improves printing and scanning reliability.

UCC/EAN-128 bar codes always contain a special non-data character known as function 1 (FNC 1), which follows the start character of the bar code. It enables scanners and processing software to auto-discriminate between UCC/EAN-128 and other bar code symbologies, and subsequently only process relevant data.

The UCC/EAN-128 bar code is made up of a leading quiet zone, a Code 128 start character A, B, or C, a FNC 1 character, Data (Application Identifier plus data field), a symbol check character, a stop character, and a trailing quiet zone.

UCC/EAN, UCC/128 are a couple of ways you'll hear someone refer to the code. This just indicates that the code is structured as dictated by the application identifiers that are used.

SSCC (Serial Shipping Container Code) formatted following the data structure layout for Application Identifier 00. See [Table 9, UCC/EAN Application Identifier on page 98](#). It could be 00 which is the SSCC code. The customer needs to let us know what application identifiers are used for their bar code so we can help them.

There are several ways of writing the code to print the code to Application Identifier '00' structure.

## Using N for the mode (m) parameter

→ Example 1: This example shows with application identifier 00 structure:

ZPL II CODE	N FOR THE M PARAMETER
<pre>^XA ^FO90,200^BY4 ^BCN,256,Y,N,Y,N ^FD&gt;;&gt;80012345123451234512^FS ^XZ</pre>	 00123451234512345120

- '>;>8' sets it to subset C, function 1
- '00' is the application identifier followed by '17 characters', the check digit is selected using the 'Y' for the (e) parameter to automatically print the 20th character.
- you are not limited to 19 characters with mode set to N

## Using U for the mode (m) parameter

→ Example 1: The example shows the application identifier 00 format:

ZPL II CODE	U FOR THE M PARAMETER
<pre>^XA ^FO90,200 ^BY4^BC,256,Y,N,,U ^FD0012345123451234512^FS ^XZ</pre>	 00123451234512345120

### UCC Case Mode

- Choosing **U** selects UCC Case mode. You will have exactly 19 characters available in **^FD**.
- Subset C using FNC1 values are automatically selected.
- Check digit is automatically inserted.

## Using D for the mode (m) parameter

→ **Example 1:** This example shows application identifier 00 format ((x.11.x or later):

ZPL II CODE	D FOR THE M PARAMETER
<pre>^XA ^FO50,200^BCN,150,Y,N,,D ^FD(00)10084423 7449200940^FS ^XZ</pre>	<p><b>D FOR THE M PARAMETER</b></p>  <p>(00) 1 0084423 7449200941</p>

(0 at end of field data is a bogus character that is inserted as a place holder for the check digit the printer will automatically insert.

- Subset C using FNC1 values are automatically selected.
- Parentheses and spaces can be in the field data. '00' application identifier, followed by 17 characters, followed by bogus check digit place holder.
- Check digit is automatically inserted. The printer will automatically calculate the check digit and put it into the bar code and interpretation line.
- The interpretation line will also show the parentheses and spaces but will strip them out from the actual bar code.

## Printing the Interpretation Line

→ **Example 1:** This example shows printing the interpretation in a different font with firmware x.11.x or later:

ZPL II CODE	INTERPRETATION LINE
<pre>^XA ^FO50,200 ^A0N,40,30^BCN,150,Y,N,Y ^FD&gt;;&gt;80012345123451234512^FS ^XZ</pre>	<p><b>INTERPRETATION LINE</b></p>  <p>00123451234512345120</p>

The font command (^A0N,40,30) can be added and changed to alter the font and size of the interpretation line.

**With firmware version later than x.10.x**

- A separate text field needs to be written.
- The interpretation line needs to be turned off.
- **^A0N, 50, 40** is the font and size selection for the separate text field.
- You have to make sure you enter the correct check digit in the text field.
- Creating a separate text field allows you to format the interpretation line with parentheses and spaces.

ZPL II CODE	FIRMWARE OLDER THAN X.10.X
<pre>^XA ^FO25,25 ^BCN,150,N,N,Y ^FD&gt;;&gt;80012345123451234512^FS ^FO100,190 ^A0N,50,40 ^FD(00) 1 2345123 451234512 0^FS ^XZ</pre>	 (00) 1 2345123 451234512 0

**Application Identifiers — UCC/EAN APPLICATION IDENTIFIER**

An Application Identifier is a prefix code used to identify the meaning and the format of the data that follows it (data field).

There are AIs for identification, traceability, dates, quantity, measurements, locations, and many other types of information.

For example, the AI for batch number is 10, and the batch number AI is always followed by an alphanumeric batch code not to exceed 20-characters.

The UCC/EAN Application Identifiers provide an open standard that can be used and understood by all companies in the trading chain, regardless of the company that originally issued the codes.

**Table 9 • UCC/EAN Application Identifier**

Data Content	AI	Plus The Following Data Structure
Serial Shipping Container Code (SSCC)	00	exactly 18 digits
Shipping Container Code	01	exactly 14 digits
Batch Numbers	10	up to 20 alpha numerics
Production Date (YYMMDD)	11	exactly 6 digits
Packaging Date (YYMMDD)	13	exactly 6 digits
Sell By Date (YYMMDD)	15	exactly 6 digits
Expiration Date (YYMMDD)	17	exactly 6 digits

a. Plus one digit for length indication.

b. Plus one digit for decimal point indication.

**Table 9 • UCC/EAN Application Identifier**

Data Content	AI	Plus The Following Data Structure
Product Variant	20	exactly 2 digits
Serial Number	21	up to 20 alpha numerics
HIBCC Quantity, Date, Batch and Link	22	up to 29 alpha numerics
Lot Number	23 <sup>a</sup>	up to 19 alpha numerics
Quantity Each	30	
Net Weight (Kilograms)	310 <sup>b</sup>	exactly 6 digits
Length, Meters	311 <sup>b</sup>	exactly 6 digits
Width or Diameter (Meters)	312 <sup>b</sup>	exactly 6 digits
Depths (Meters)	313 <sup>b</sup>	exactly 6 digits
Area (Sq. Meters)	314 <sup>b</sup>	exactly 6 digits
Volume (Liters)	315 <sup>b</sup>	exactly 6 digits
Volume (Cubic Meters)	316 <sup>b</sup>	exactly 6 digits
Net Weight (Pounds)	320 <sup>b</sup>	exactly 6 digits
Customer PO Number	400	up to 29 alpha numerics
Ship To (Deliver To) Location Code using EAN 13 or DUNS Number with leading zeros	410	exactly 13 digits
Bill To (Invoice To) Location Code using EAN 13 or DUNS Number with leading zeros	411	exactly 13 digits
Purchase from	412	exactly 13 digits
Ship To (Deliver To) Postal Code within single postal authority	420	up to 9 alpha numerics
Ship To (Deliver To) Postal Code with 3-digit ISO Country Code Prefix	421	3 digits plus up to 9 alpha numerics
Roll Products - width, length, core diameter, direction and splices	8001	exactly 14 digits
Electronic Serial number for cellular mobile phone	8002	up to 20 alpha numerics

**a.** Plus one digit for length indication.

**b.** Plus one digit for decimal point indication.

**Note •** Table 9 is a partial table showing the application identifiers. For more current and complete information, search the Internet for **UCC Application Identifier**.

For date fields that only need to indicate a year and month, the day field is set to **00**.

### Chaining several application identifiers (firmware x.11.x or later)

The FNC1, which is invoked by >8, is inserted just before the AI's so that the scanners reading the code sees the FNC1 and knows that an AI follows.

→ **Example 1:** This is an example with the mode parameter set to A (automatic):

```
^XA  
^BY2,2.5,193  
^FO33,400  
^BCN,,N,N,N,A  
^FD>;>80204017773003486100008535>8910001>837252^FS  
^FT33,625^AEN,0,0^FD(02)04017773003486(10)0008535(91)0001(37)2  
52^FS  
^XZ
```

→ **Example 2:** This is an example with the mode parameter set to U:

```
^XA  
^BY3,2.5,193  
^FO33,200  
^BCN,,N,N,N,U  
^FD>;>80204017773003486>8100008535>8910001>837252^FS  
^FT33,455^A0N,30,30^FD(02)04017773003486(10)0008535(91)0001(37)  
)252^FS  
^XZ
```

→ **Example 3:** This is an example with the mode parameter set to D\*:

```
^XA  
^PON  
^LH0,0  
^BY2,2.5,145  
^FO218,343  
^BCB,,Y,N,N,D  
^FD(91)0005886>8(10)0000410549>8(99)05^FS  
^XZ
```

D\* — When trying to print the last Application Identifier with an odd number of characters, a problem existed when printing EAN128 bar codes using Mode D. The problem was fixed in firmware version V60.13.0.6.

## ^BD – UPS MaxiCode Bar Code

The ^BD command creates a two-dimensional, optically read (not scanned) code. This symbology was developed by UPS (United Parcel Service).

Notice that there are no additional parameters for this code and it does not generate an interpretation line. The ^BY command has no effect on the UPS MaxiCode bar code. However, the ^CV command can be activated.

**Format:** ^BDm,n,t

Parameters	Details
m = mode	<b>Values:</b> 2 = structured carrier message: numeric postal code (U.S.) 3 = structured carrier message: alphanumeric postal code (non-U.S.) 4 = standard symbol, secretary 5 = full EEC 6 = reader program, secretary <b>Default:</b> 2
n = symbol number	<b>Values:</b> 1 to 8 can be added in a structured document <b>Default:</b> 1
t = total number of symbols	<b>Values:</b> 1 to 8, representing the total number of symbols in this sequence <b>Default:</b> 1

**Example:** This is an example of UPS MAXICODE - MODE 2 bar code:

<b>ZPL II CODE</b> <pre> ^XA ^FO50,50 ^CVY ^BD^FH^FD001840152382802 [)&gt;_1E01_1D961Z00004951_1DUPSN_ 1D_06X610_1D159_1D1234567_1D1/1_ 1D_1DY_1D634 ALPHA DR_ 1DPITTSBURGH_1DPA_1E_04^FS ^FO30,300^A0,30,30^FDMode2^FS ^XZ </pre>	<b>UPS MAXICODE - MODE 2</b> 
--	--

### Special Considerations for ^FD when Using ^BD

The ^FD statement is divided into two parts: a high priority message (**hpm**) and a low priority message (**lpm**). There are two types of high priority messages. One is for a U.S. Style Postal Code; the other is for a non-U.S. Style Postal Code. The syntax for either of these high priority messages must be exactly as shown or an error message is generated.

**Format:** ^FD <hpm><lpm>

Parameters	Details
<hpm> = high priority message (applicable only in Modes 2 and 3)	<p><b>Values:</b> 0 to 9, except where noted</p> <p>U.S. Style Postal Code (Mode 2)</p> <p>&lt;hpm&gt; = aaabbcccccddd      aaa = three-digit class of service      bbb = three-digit country zip code      ccccc = five-digit zip code      dddd = four-digit zip code extension (if none exists, four zeros (0000) must be entered)</p> <p><b>non-U.S. Style Postal Code (Mode 3)</b></p> <p>&lt;hpm&gt; = aaabbccccc      aaa = three-digit class of service      bbb = three-digit country zip code      ccccc = six-digit zip code (A through Z or 0 to 9)</p>
<1pm> = low priority message (only applicable in Modes 2 and 3)	<p>GS is used to separate fields in a message (0x1D). RS is used to separate format types (0x1E). EOT is the end of transmission characters.</p> <p><b>Message Header</b> []&gt;RS</p> <p><b>Transportation Data</b></p> <p><b>Format Header</b> 01GS96</p> <p><b>Tracking Number</b>*&lt;tracking number&gt;</p> <p><b>SCAC</b>*GS&lt;SCAC&gt;</p> <p><b>UPS Shipper Number</b>GS&lt;shipper number&gt;</p> <p><b>Julian Day of Pickup</b>GS&lt;day of pickup&gt;</p> <p><b>Shipment ID Number</b>GS&lt;shipment ID number&gt;</p> <p><b>Package n/x</b>GS&lt;n/x&gt;</p> <p><b>Package Weight</b>GS&lt;weight&gt;</p> <p><b>Address Validation</b>GS&lt;validation&gt;</p> <p><b>Ship to Street Address</b>GS&lt;street address&gt;</p> <p><b>Ship to City</b>GS&lt;city&gt;</p> <p><b>Ship to State</b>GS&lt;state&gt;</p> <p><b>RS</b>RS</p> <p><b>End of Message</b>EOT</p> <p>(* Mandatory Data for UPS)</p>

### Comments

- The formatting of <hpm> and <1pm> apply only when using Modes 2 and 3. Mode 4, for example, takes whatever data is defined in the ^FD command and places it in the symbol.
- UPS requires that certain data be present in a defined manner. When formatting MaxiCode data for UPS, always use uppercase characters. When filling in the *fields* in the <1pm> for UPS, follow the data size and types specified in *Guide to Bar Coding with UPS*.

- If you do not choose a mode, the default is Mode 2. If you use non-U.S. Postal Codes, you probably get an error message (invalid character or message too short). When using non-U.S. codes, use Mode 3.
- ZPL II doesn't automatically change your mode based on the zip code format.
- When using special characters, such as GS, RS, or EOT, use the **^FH** command to tell ZPL II to use the hexadecimal value following the underscore character ( \_ ).

## ^BE – EAN-13 Bar Code

The ^BE command is similar to the UPC-A bar code. It is widely used throughout Europe and Japan in the retail marketplace.

The EAN-13 bar code has 12 data characters, one more data character than the UPC-A code. An EAN-13 symbol contains the same number of bars as the UPC-A, but encodes a 13th digit into a parity pattern of the left-hand six digits. This 13th digit, in combination with the 12th digit, represents a country code.

- ^BE supports fixed print ratios.
- Field data (^FD) is limited to exactly 12 characters. ZPL II automatically truncates or pads on the left with zeros to achieve the required number of characters.
- When using JAN-13 (Japanese Article Numbering), a specialized application of EAN-13, the first two non-zero digits sent to the printer must be 49.

**Note** • Use Interleaved 2 of 5 for UCC and EAN 14.

**Important** • If additional information about the EAN-13 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BEo,h,f,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

**Example:** This is an example of an EAN-13 bar code:

ZPL II CODE	EAN-13 BAR CODE
<pre>^XA ^FO100,100^BY3 ^BEN,100,Y,N ^FD12345678^FS ^XZ</pre>	A standard EAN-13 barcode representing the number 0 000123 456784. The barcode has a total of 13 vertical bars of varying widths.
EAN-13 BAR CODE CHARACTERS	
0      1      2      3      4      5      6      7      8      9	

**Comments** The EAN-13 bar code uses the Mod 10 check-digit scheme for error checking. For more information on Mod 10, see [Mod 10 Check Digit](#) on page 1323.

## ^BF – MicroPDF417 Bar Code

The ^BF command creates a two-dimensional, multi-row, continuous, stacked symbology identical to PDF417, except it replaces the 17-module-wide start and stop patterns and left/right row indicators with a unique set of 10-module-wide row address patterns. These reduce overall symbol width and allow linear scanning at row heights as low as 2X.

MicroPDF417 is designed for applications with a need for improved area efficiency but without the requirement for PDF417's maximum data capacity. It can be printed only in specific combinations of rows and columns up to a maximum of four data columns by 44 rows.

Field data (^FD) and field hexadecimal (^FH) are limited to:

- 250 7-bit characters
- 150 8-bit characters
- 366 4-bit numeric characters

**Format:** ^BF<sub>o</sub>,<sub>h</sub>,<sub>m</sub>

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 9999 <b>Default:</b> value set by ^BY or 10 (if no ^BY value exists).
<b>m</b> = mode	<b>Values:</b> 0 to 33 (see <a href="#">Table 10, MicroPDF417 Mode on page 107</a> ) <b>Default:</b> 0 (see <a href="#">Table 10</a> )

**Example:** This is an example of a MicroPDF417 bar code:

**To encode data into a MicroPDF417 bar code, complete these steps:**

1. Determine the type of data to be encoded (for example, ASCII characters, numbers, 8-bit data, or a combination).

2. Determine the maximum amount of data to be encoded within the bar code (for example, number of ASCII characters, quantity of numbers, or quantity of 8-bit data characters).
3. Determine the percentage of check digits that are used within the bar code. The higher the percentage of check digits that are used, the more resistant the bar code is to damage — however, the size of the bar code increases.
4. Use [Table 10](#) with the information gathered from the questions above to select the mode of the bar code.

**Table 10 • MicroPDF417 Mode**

Mode (M)	Number of Data Columns	Number of Data Rows	% of Cws for EC	Max Alpha Characters	Max Digits
0	1	11	64	6	8
1	1	14	50	12	17
2	1	17	41	18	26
3	1	20	40	22	32
4	1	24	33	30	44

30	4	32	30	178	261
31	4	38	29	214	313
32	4	44	28	250	366
33	4	4	50	14	20

## ^BI – Industrial 2 of 5 Bar Codes

The ^BI command is a discrete, self-checking, continuous numeric symbology. The Industrial 2 of 5 bar code has been in use the longest of the 2 of 5 family of bar codes. Of that family, the Standard 2 of 5 (^BJ) and Interleaved 2 of 5 (^B2) bar codes are also available in ZPL II.

With Industrial 2 of 5, all of the information is contained in the bars. Two bar widths are employed in this code, the wide bar measuring three times the width of the narrow bar.

- ^BI supports a print ratio of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the Industrial 2 of 5 bar code, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BIO,h,f,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

**Example:** This is an example of an Industrial 2 of 5 bar code:

ZPL II CODE	INDUSTRIAL 2 OF 5 BAR CODE
<pre>^XA ^FO100,100^BY3 ^BIN,150,Y,N ^FD123456^FS ^XZ</pre>	 123456

## ^BJ – Standard 2 of 5 Bar Code

The ^BJ command is a discrete, self-checking, continuous numeric symbology.

With Standard 2 of 5, all of the information is contained in the bars. Two bar widths are employed in this code, the wide bar measuring three times the width of the narrow bar.

- ^BJ supports a print ratio of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the Standard 2 of 5 bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BJo,h,f,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

**Example:** This is an example of a Standard 2 of 5 bar code:

ZPL II CODE	STANDARD 2 OF 5 BAR CODE

Start/Stop (automatic)	

## ^BK – ANSI Codabar Bar Code

The ANSI Codabar bar code is used in a variety of information processing applications such as libraries, the medical industry, and overnight package delivery companies. This bar code is also known as USD-4 code, NW-7, and 2 of 7 code. It was originally developed for retail price labeling.

Each character in this code is composed of seven elements: four bars and three spaces. Codabar bar codes use two character sets, numeric and control (start and stop) characters.

- ^BK supports a print ratio of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the ANSI Codabar bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BKo,e,h,f,g,k,l

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>e</b> = check digit	<b>Fixed Value:</b> N
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>k</b> = designates a start character	<b>Values:</b> A, B, C, D <b>Default:</b> A
<b>l</b> = designates stop character	<b>Values:</b> A, B, C, D <b>Default:</b> A

**Example:** This is an example of an ANSI Codabar bar code:

ZPL II CODE	ANSI CODABAR BAR CODE
<pre>^XA ^FO100,100^BY3 ^BKN,N,150,Y,N,A,A ^FD123456^FS ^XZ</pre>	 A123456A

## ^BL – LOGMARS Bar Code

The ^BL command is a special application of Code 39 used by the Department of Defense. LOGMARS is an acronym for Logistics Applications of Automated Marking and Reading Symbols.

- ^BL supports a print ratio of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label. Lowercase letters in the ^FD string are converted to the supported uppercase LOGMARS characters.

**Important** • If additional information about the LOGMARS bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BLo,h,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> <b>N</b> = normal <b>R</b> = rotated 90 degrees (clockwise) <b>I</b> = inverted 180 degrees <b>B</b> = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>g</b> = print interpretation line above code	<b>Values:</b> <b>N</b> = no <b>Y</b> = yes <b>Default:</b> N

**Example:** This is an example of a LOGMARS bar code:

ZPL II CODE	LOGMARS BAR CODE
<pre>^XA ^FO100,75^BY3 ^BLN,100,N ^FD12AB^FS ^XZ</pre>	 12ABO
LOGMARS BAR CODE CHARACTERS	
0 A 1 B 2 C 3 D 4 E 5 F 6 G 7 H 8 I 9 J K L M N O P Q R S T U V W X Y Z - . \$ / + % SPACE	

**Comments** The LOGMARS bar code produces a *mandatory* check digit using Mod 43 calculations. For further information on the Mod 43 check digit, see [Mod 10 Check Digit](#) on page 1323.

## ^BM – MSI Bar Code

The ^BM command is a pulse-width modulated, continuous, non-self-checking symbology. It is a variant of the Plessey bar code (^BP).

Each character in the MSI bar code is composed of eight elements: four bars and four adjacent spaces.

- ^BM supports a print ratio of 2.0:1 to 3.0:1.
- For the bar code to be valid, field data (^FD) is limited to 1 to 14 digits when parameter e is B, C, or D. ^FD is limited to 1 to 13 digits when parameter e is A, plus a quiet zone.

**Important** • If additional information about the MSI bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BM<sub>o</sub>,e,h,f,g,e2

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>e</b> = check digit selection	<b>Values:</b> A = no check digits B = 1 Mod 10 C = 2 Mod 10 D = 1 Mod 11 and 1 Mod 10 <b>Default:</b> B
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

Parameters	Details
<b>e2</b> = inserts check digit into the interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> N

→ **Example:** This is an example of a MSI bar code:

ZPL II CODE	MSI BAR CODE
<pre>^XA ^FO100,100^BY3 ^BMN,B,100,Y,N,N ^FD123456^FS ^XZ</pre>	 123456
MSI BAR CODE CHARACTERS	
1      2      3      4      5      6      7      8      9	

## ^BO – Aztec Bar Code Parameters

The ^BO command creates a two-dimensional matrix symbology made up of square modules arranged around a bulls-eye pattern at the center.

**Note** • The Aztec bar code works with firmware version V60.13.0.11A and V50.13.2 or later.

**Format:** ^BOa,b,c,d,e,f,g

Parameters	Details
a = orientation	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>N = normal</li> <li>R = rotated</li> <li>I = inverted 180 degrees</li> <li>B = read from bottom up, 270 degrees</li> </ul> <p><b>Default:</b> current ^FW value</p>
b = magnification factor	<p><b>Values:</b> 1 to 10</p> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>1 on 150 dpi printers</li> <li>2 on 200 dpi printers</li> <li>3 on 300 dpi printers</li> <li>6 on 600 dpi printers</li> </ul>
c = extended channel interpretation code indicator	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>Y = if data contains ECICs</li> <li>N = if data does not contain ECICs.</li> </ul> <p><b>Default:</b> N</p>
d = error control and symbol size/type indicator	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>0 = default error correction level</li> <li>01 to 99 = error correction percentage (minimum)</li> <li>101 to 104 = 1 to 4-layer compact symbol</li> <li>201 to 232 = 1 to 32-layer full-range symbol</li> <li>300 = a simple Aztec “Rune”</li> </ul> <p><b>Default:</b> 0</p>
e = menu symbol indicator	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>Y = if this symbol is to be a menu (bar code reader initialization) symbol</li> <li>N = if it is not a menu symbol</li> </ul> <p><b>Default:</b> N</p>
f = number of symbols for structured append	<p><b>Values:</b> 1 through 26</p> <p><b>Default:</b> 1</p>

Parameters	Details
<i>g</i> = optional ID field for structured append	The ID field is a text string with 24-character maximum <b>Default:</b> no ID

→ **Example:** This is an example of the ^B0 command:

## ^BP – Plessey Bar Code

The ^BP command is a pulse-width modulated, continuous, non-self- checking symbology.

Each character in the Plessey bar code is composed of eight elements: four bars and four adjacent spaces.

- ^BP supports a print ratio of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label.

**Important** • If additional information about the Plessey bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^B<sub>P</sub>o,e,h,f,g

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>e</b> = print check digit	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>h</b> = bar code height (in dots)	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N

**Example:** This is an example of a Plessey bar code:

ZPL II CODE	PLESSEY BAR CODE
<pre>^XA ^FO100,100^BY3 ^BPN,N,100,Y,N ^FD12345^FS ^XZ</pre>	 12345
PLESSEY BAR CODE CHARACTERS	
0      1      2      3      4      5      6      7      8      9	A      B      C      D      E      F

## ^BQ – QR Code Bar Code

The ^BQ command produces a matrix symbology consisting of an array of nominally square modules arranged in an overall square pattern. A unique pattern at three of the symbol's four corners assists in determining bar code size, position, and inclination.

A wide range of symbol sizes is possible, along with four levels of error correction. User-specified module dimensions provide a wide variety of symbol production techniques.

QR Code Model 1 is the original specification, while QR Code Model 2 is an enhanced form of the symbology. Model 2 provides additional features and can be automatically differentiated from Model 1.

Model 2 is the recommended model and should normally be used.

This bar code is printed using field data specified in a subsequent ^FD string.

Encodable character sets include numeric data, alphanumeric data, 8-bit byte data, and Kanji characters.

**Important** • If additional information about the QR Code bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BQa,b,c,d,e

Parameters	Details
a = field orientation	<b>Values:</b> normal (^FW has no effect on rotation)
b = model	<b>Values:</b> 1 (original) and 2 (enhanced – recommended) <b>Default:</b> 2
c = magnification factor	<b>Values:</b> 1 to 10 <b>Default:</b> 1 on 150 dpi printers 2 on 200 dpi printers 3 on 300 dpi printers 6 on 600 dpi printers
d = error correction	<b>Values:</b> H = ultra-high reliability level Q = high reliability level M = standard level L = high density level <b>Default:</b> Q = if empty M = invalid values
e = mask value	<b>Values:</b> 0 - 7 <b>Default:</b> 7

**Example 1:** This is an example of a QR Code bar code:

ZPL II CODE	QR CODE BAR CODE
<pre>^XA ^FO100,100 ^BQN,2,10 ^FDMM, AAC-42^FS ^XZ</pre>	

On the pages that follow are specific commands for formatting the ^BQ command with the ^FD statements that contain the information to be coded.

### QR Switches (formatted into the ^FD field data)

There are 4 switch fields that are allowed, some with associated parameters and some without. Two of these fields are always present, one is optional, and one's presence depends on the value of another. The switches are always placed in a fixed order. The four switches, in order are:

- Mixed mode <D>iijjxx,Optional (note that this switch ends with a comma ",")
- Error correction level <H, Q, M, L>Mandatory
- Data input <A, M>,Mandatory (note that this switch ends with a comma ",")
- Character Mode <N, A, Bddd, K>Conditional (present if data input is M)

#### Mixed mode (Optional)

= D - allows mixing of different types of character modes in one code.

ii = code No. – a 2 digit number in the range 01 to 16

Value = subtracted from the Nth number of the divided code (must be two digits).

jj = No. of divisions – a 2 digit number in the range 02 to 16

Number of divisions (must be two digits).

xx = parity data – a 2 digit hexadecimal character in the range 00 to FF

Parity data value is obtained by calculating at the input data (the original input data before divided byte-by-byte through the EX-OR operation).

, = the mixed mode switch, when present, is terminated with a comma

#### Error correction level (Required)

= H, Q, M, or L

H = ultra-high reliability level

Q = high reliability level

M = standard level (default)

L = high density level

### **Data input (Required)**

= A or M followed by a comma

A = Automatic Input (default). Character Mode is not specified.

Data character string JIS8 unit, Shift JIS. When the input mode is Automatic Input, the binary codes of 0x80 to 0x9F and 0xE0 to 0xFF cannot be set.

M = Manual Input. Character Mode must be specified.

Two types of data input mode exist: Automatic (A) and Manual (M). If A is specified, the character mode does not need to be specified. If M is specified, the character mode must be specified.

Character Mode (Required when data input = M)

= N, A, Bxxxx, or K

N = numeric: digits 0 – 9

A = alphanumeric: digits 0 – 9, upper case letters A – Z, space, and \$%\*+-./:) (45 characters)

Bxxxx = 8-bit byte mode. The ‘xxxx’ is the number of characters and must be exactly 4 decimal digits.

This handles the 8-bit Latin/Kana character set in accordance with JIS X 0201 (character values 0x00 to 0xFF).

K = Kanji — handles only Kanji characters in accordance with the Shift JIS system based on JIS X 0208. This means that all parameters after the character mode K should be 16-bit characters. If there are any 8-bit characters (such as ASCII code), an error occurs.

The data to be encoded follows immediately after the last switch.

### **Considerations for ^FD When Using the QR Code:**

#### **QR Switches (formatted into the ^FD field data)**

##### **mixed mode <D>**

D = allows mixing of different types of character modes in one code.

##### **code No. <01 16>**

Value = subtracted from the Nth number of the divided code (must be two digits).

##### **No. of divisions <02 16>**

Number of divisions (must be two digits).

##### **parity data <1 byte>**

Parity data value is obtained by calculating at the input data (the original input data before divided byte-by-byte through the EX-OR operation).

**error correction level <H, Q, M, L>**

**H** = ultra-high reliability level  
**Q** = high reliability level  
**M** = standard level (default)  
**L** = high density level

**character Mode <N, A, B, K>**

**N** = numeric  
**A** = alphanumeric  
**Bxxxx** = 8-bit byte mode. This handles the 8-bit Latin/Kana character set in accordance with JIS X 0201 (character values 0x00 to 0xFF).  
**xxxx** = number of data characters is represented by two bytes of BCD code.  
**K** = Kanji — handles only Kanji characters in accordance with the Shift JIS system based on JIS X 0208. This means that all parameters after the character mode **K** should be 16-bit characters. If there are any 8-bit characters (such as ASCII code), an error occurs.

**data character string <Data>**

Follows character mode or it is the last switch in the **^FD** statement.

**data input <A, M>**

**A** = Automatic Input (default). Data character string JIS8 unit, Shift JIS. When the input mode is Automatic Input, the binary codes of 0x80 to 0x9F and 0xE0 to 0xFF cannot be set.  
**M** = Manual Input

Two types of data input mode exist: Automatic (A) and Manual (M). If A is specified, the character mode does not need to be specified. If M is specified, the character mode must be specified.

**^FD Field Data (Normal Mode)**

Automatic Data Input (A) with Switches

**^FD**

**<error correction level>A,**  
**<data character string>**  
**^FS**

**Example 1:** QR Code, normal mode with automatic data input.

<b>1</b>	<b>Q</b> = error correction level
<b>2</b>	<b>A,</b> = automatic setting
<b>3</b>	data string character

## Manual Data Input (M) with Switches

```
^FD
<error correction level>M,
<character mode><data character string>
^FS
```

→ Example 1: QR Code, normal mode with manual data input:

<b>1</b>	H = error correction level (ultra-high reliability level)
<b>2</b>	M, = input mode (manual input)
<b>3</b>	N = character mode (numeric data)
<b>4</b>	data character string

→ Example 2: QR Code, normal mode with standard reliability and manual data input:

<b>1</b>	M = error correction level (standard-high reliability level)
<b>2</b>	M, = manual input
<b>3</b>	A = alphanumeric data
<b>4</b>	AC-42 = data character string

**^FD Field Data (Mixed Mode – requires more switches)****Automatic Data Input (A) with Switches**

```
^FD
<D><code No.> <No. of divisions> <parity data>,
<error correction level> A,
<data character string>,
<data character string>,
< : >,
<data character string n**>
^FS
```

**Manual Data Input (M) with Switches**

```
^FD
<code No.> <No. of divisions> <parity data>,
<error correction level> M,
<character mode 1> <data character string 1>,
<character mode 2> <data character string 2>,
< : > < : >,
<character mode n> <data character string n**>
^FS
```

n\*\* up to 200 in mixed mode

→ **Example:** QR Code, mixed mode with manual data input:

ZPL II CODE	GENERATED LABEL
<pre><b>^XA</b> <b>^FO,20,20</b><b>^BQ,2,10</b> <b>^FDD03048F,LM,N0123456789,A12AABB,B0006qrcode</b><b>^FS</b> <b>^XZ</b></pre>	

<b>&lt;mixed mode identifier&gt;</b>	D	(mixed)
<b>&lt;code No.&gt;</b>	M	(code number)
<b>&lt;No. of divisions&gt;</b>	D	(divisions)
<b>&lt;parity data&gt;</b>	M	(0x0C)
'		
<b>&lt;error correction level&gt;</b>	L	(high-density level)
<b>&lt;input mode&gt;</b>	M	(manual input)
'		
<b>&lt;character mode&gt;</b>	N	(numeric data)

---

<b>&lt;data character string&gt;</b>	0123456789	
<b>&lt;character mode&gt;</b>	A	(alphanumeric data)
<b>&lt;data character string&gt;</b>	12AABB	
<b>&lt;character mode&gt;</b>	B	(8-bit byte data)
	0006	(number of bytes)
<b>&lt;data character string&gt;</b>	qrcode	

---

→ **Example:** This is an example of QR Code, mixed mode with automatic data input:

```
^XA
^FO20,20^BQ,2,10
^FDD03040C,LA,012345678912AABBqrcode^FS
^XZ
```

---

<b>&lt;mixed mode identifier&gt;</b>	D	D (mixed)
<b>&lt;code No.&gt;</b>	M	03 (code number)
<b>&lt;No. of divisions&gt;</b>	D	04 (divisions)
<b>&lt;parity data&gt;</b>	M	0C (0x0C)
<b>&lt;error correction level&gt;</b>	L	L (high-density level)
<b>&lt;input mode&gt;</b>	A	A (automatic input)
<b>&lt;data character string&gt;</b>	012345678912AABBqrcode	

---

.14↑

For proper functionality, when encoding Kanji characters in **^CI28-30** (Unicode) be sure the **JIS.DAT** table is loaded on the printer and specified.

→

**Example:** This is a Unicode example:

## ^BR – GS1 Databar

(formerly Reduced Space Symbology)

The ^BR command is bar code types for space-constrained identification from EAN International and the Uniform Code Council, Inc.

**Format:** ^BRA,**b,c,d,e,f**

Parameters	Details
<b>a</b> = orientation	<b>Values:</b> N = Normal R = Rotated I = Inverted B = Bottom-up <b>Default:</b> R
<b>b</b> = symbology type in the GS1 DataBar family	<b>Values:</b> 1 = GS1 DataBar Omnidirectional 2 = GS1 DataBar Truncated 3 = GS1 DataBar Stacked 4 = GS1 DataBar Stacked Omnidirectional 5 = GS1 DataBar Limited 6 = GS1 DataBar Expanded 7 = UPC-A 8 = UPC-E 9 = EAN-13 10 = EAN-8 11 = UCC/EAN-128 and CC-A/B 12 = UCC/EAN-128 and CC-C <b>Default:</b> 1
<b>c</b> = magnification factor	<b>Values:</b> 1 to 10 <b>Default:</b> 24 dot = 6, 12 dot is 3, 8 dot and lower is 2 12 dot = 6, > 8 dot is 3, 8 dot and less is 2
<b>d</b> = separator height	<b>Values:</b> 1 or 2 <b>Default:</b> 1
<b>e</b> = bar code height	The bar code height only affects the linear portion of the bar code. Only UCC/EAN and CC-A/B/C. <b>Values:</b> 1 to 32000 dots <b>Default:</b> 25
<b>f</b> = the segment width (GS1 DataBar Expanded only)	<b>Values:</b> 2 to 22, even numbers only, in segments per line <b>Default:</b> 22

→ **Example 1:** This is an example of Symbology Type 7 - UPC-A:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO10,10^BRN,7,5,2,100 ^FD12345678901 this is composite info^FS ^XZ</pre>	A standard UPC-A barcode representing the number 12345678901.

→ **Example 2:** This is an example of Symbology Type 1 - GS1 DataBar Omnidirectional:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO10,10^BRN,1,5,2,100 ^FD12345678901 this is composite info^FS ^XZ</pre>	A GS1 DataBar Omnidirectional barcode representing the number 12345678901.

## ^BS – UPC/EAN Extensions

The ^BS command is the two-digit and five-digit add-on used primarily by publishers to create bar codes for ISBNs (International Standard Book Numbers). These extensions are handled as separate bar codes.

The ^BS command is designed to be used with the UPC-A bar code (^BU) and the UPC-E bar code (^B9).

- ^BS supports a fixed print ratio.
- Field data (^FD) is limited to exactly two or five characters. ZPL II automatically truncates or pads on the left with zeros to achieve the required number of characters.

**Important** • If additional information about the UPC/EAN bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BS<sub>o</sub>,<sub>h</sub>,<sub>f</sub>,<sub>g</sub>

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> Y

**Example 1:** This is an example of a UPC/EAN Two-digit bar code:

ZPL II CODE	UPC/EAN 2-DIGIT BAR CODE
<pre>^XA ^FO100,100^BY3 ^BSN,100,Y,N ^FD12^FS ^XZ</pre>	 12
UPC/EAN 2-DIGIT BAR CODE CHARACTERS	
0      1      2      3      4      5      6      7      8      9	

**Example 2:** This is an example of a UPC/EAN Five-digit bar code:

ZPL II CODE	UPC/EAN 5-DIGIT BAR CODE
<pre>^XA ^FO100,100^BY3 ^BSN,100,Y,N ^FD12345^FS ^XZ</pre>	 12345
UPC/EAN 5-DIGIT BAR CODE CHARACTERS	
0      1      2      3      4      5      6      7      8      9	

Care should be taken in positioning the UPC/EAN extension with respect to the UPC-A or UPC-E code to ensure the resulting composite code is within the UPC specification.

For UPC codes, with a module width of **2** (default), the field origin offsets for the extension are:

**Example 3:** This is an example of a UPC-A:

	Supplement Origin X - Offset	Adjustment Y - Offset
<b>Normal</b>	209 Dots	21 Dots
<b>Rotated</b>	0	209 Dots

This is an example of a UPC-E:

	Supplement Origin X - Offset	Adjustment Y - Offset
<b>Normal</b>	122 Dots	21 Dots
<b>Rotated</b>	0	122 Dots

Additionally, the bar code height for the extension should be 27 dots (0.135 inches) shorter than that of the primary code. A primary UPC code height of 183 dots (0.900 inches) requires an extension height of 155 dots (0.765 inches).

**Example 4:** This example illustrates how to create a normal UPC-A bar code for the value 7000002198 with an extension equal to 04414:

ZPL II CODE	UPC-A BAR CODE WITH EXTENSION
<pre> ^XA ^FO100,100^BY3 ^BUN,137 ^FD07000002198^FS ^FO400,121 ^BSN,117 ^FD04414^FS ^XZ </pre>	<p>04414</p>

## ^BT – TLC39 Bar Code

The ^BT bar code is the standard for the TCIF can tag telecommunications equipment.

The TCIF CLEI code, which is the MicroPDF417 bar code, is always four columns. The firmware must determine what mode to use based on the number of characters to be encoded.

**Format:** ^BTo,w1,r1,h1,w2,h2

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> <b>N</b> = normal <b>R</b> = rotated <b>I</b> = inverted <b>B</b> = bottom up
<b>w1</b> = width of the Code 39 bar code	<i>Accepted Value (in dots): 1 to 10</i> <i>Default Value (600 dpi printer): 4</i> <i>Default Value (200- and 300 dpi printer): 2</i>
<b>r1</b> = wide to narrow bar width ratio the Code 39 bar code	<b>Values: 2.0 to 3.0(increments of 0.1)</b> <b>Default: 2.0</b>
<b>h1</b> = height of the Code 39 bar code	<i>Accepted Values (in dots): 1 to 9999</i> <i>Default Value (600 dpi printer): 120</i> <i>Default Value (300 dpi printer): 60</i> <i>Default Value (200 dpi printer): 40</i>
<b>h2</b> = row height of the MicroPDF417 bar code	<i>Accepted Values (in dots): 1 to 255</i> <i>Default Value (600 dpi printer): 8</i> <i>Default Value (200- and 300 dpi printers): 4</i>
<b>w2</b> = narrow bar width of the MicroPDF417 bar code	<i>Accepted Values (in dots): 1 to 10</i> <i>Default Value (600 dpi printer): 4</i> <i>Default Value (200- and 300 dpi printers): 2</i>

**Example: TLC39 Bar Code**

This is an example on how to print TLC39 bar code. The callouts identify the key components and are followed by a detailed description below:

Use the command defaults to get results that are in compliance with TCIF industry standards; regardless of printhead density.

<b>1</b> <b>ECI Number.</b> If the seventh character is <b>not</b> a comma, only Code 39 prints. This means if more than 6 digits are present, Code 39 prints for the first six digits (and no Micro-PDF symbol is printed). <ul style="list-style-type: none"> <li>• Must be 6 digits.</li> <li>• Firmware generates invalid character error if the firmware sees anything but 6 digits.</li> <li>• This number is not padded.</li> </ul>
<b>2</b> <b>Serial number.</b> The serial number can contain up to 25 characters and is variable length. The serial number is stored in the Micro-PDF symbol. If a comma follows the serial number, then additional data is used below. <ul style="list-style-type: none"> <li>• If present, must be alphanumeric (letters and numbers, no punctuation).</li> </ul> <p>This value is used if a comma follows the ECI number.</p>
<b>3</b> <b>Additional data.</b> If present, it is used for things such as a country code. Data cannot exceed 150 bytes. This includes serial number commas. <ul style="list-style-type: none"> <li>• Additional data is stored in the Micro-PDF symbol and appended after the serial number. A comma must exist between each maximum of 25 characters in the additional fields.</li> <li>• Additional data fields can contain up to 25 alphanumeric characters per field.</li> </ul> <p>The result is:</p>

ZPL II CODE	GENERATED LABEL
<pre> ^XA^FO100, 100^BT^FD123456, ABCd12345678901234, 5551212, 88899 ^FS^XZ </pre>	

## ^BU – UPC-A Bar Code

The ^BU command produces a fixed length, numeric symbology. It is primarily used in the retail industry for labeling packages. The UPC-A bar code has 11 data characters. The 6 dot/mm, 12 dot/mm, and 24 dot/mm printheads produce the UPC-A bar code (UPC/EAN symbologies) at 100 percent size. However, an 8 dot/mm printhead produces the UPC/EAN symbologies at a magnification factor of 77 percent.

- ^BU supports a fixed print ratio.
- Field data (^FD) is limited to exactly 11 characters. ZPL II automatically truncates or pads on the left with zeros to achieve required number of characters.

**Important** • If additional information about the UPC-A bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org).

**Format:** ^BUo,h,f,g,e

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 9999 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>e</b> = print check digit	<b>Values:</b> N = no Y = yes <b>Default:</b> Y

The font style of the interpretation line depends on the modulus (width of narrow bar) selected in ^BY:

**Note** • Zero is not allowed.

- **6 dot/mm printer:** a modulus of 2 dots or greater prints with an OCR-B interpretation line; a modulus of 1 dot prints font A.
- **8 dot/mm printer:** a modulus of 3 dots or greater prints with an OCR-B interpretation line; a modulus of 1 or 2 dots prints font A.
- **12 dot/mm printer:** a modulus of 5 dots or greater prints with an OCR-B interpretation line; a modulus of 1, 2, 3, or 4 dots prints font A.
- **24 dot/mm printer:** a modulus of 9 dots or greater prints with an OCR-B interpretation line; a modulus of 1 to 8 dots prints font A.

**Example:** This is an example of a UPC-A bar code with extension:

ZPL II CODE	UPC-A BAR CODE WITH EXTENSION
<pre>^XA ^FO100,100^BY3 ^BUN,137 ^FD0700002198^FS ^FO400,121 ^BSN,117 ^FD04414^FS ^XZ</pre>	A standard UPC-A barcode with a check digit. The barcode represents the number 0 70000 02198 5. To the right of the barcode, the numbers 04414 are printed vertically, which is the check digit for the barcode number. <p>0 70000 02198 5</p> <p>04414</p>

**Comments** The UPC-A bar code uses the Mod 10 check digit scheme for error checking. For further information on Mod 10, see [Mod 10 Check Digit on page 1323](#).

## ^BX – Data Matrix Bar Code

The ^BX command creates a two-dimensional matrix symbology made up of square modules arranged within a perimeter finder pattern.

**Format:** ^BX<sub>o</sub>,<sub>h</sub>,<sub>s</sub>,<sub>c</sub>,<sub>r</sub>,<sub>f</sub>,<sub>g</sub>,<sub>a</sub>

Parameters	Details
<b>o</b> = orientation	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>N = normal</li> <li>R = rotated 90 degrees (clockwise)</li> <li>I = inverted 180 degrees</li> <li>B = read from bottom up, 270 degrees</li> </ul> <p><b>Default:</b> current ^FW value</p>
<b>h</b> = dimensional height of individual symbol elements	<p><b>Values:</b> 1 to the width of the label</p> <p>The individual elements are square — this parameter specifies both module and row height. If this parameter is zero (or not given), the h parameter (bar height) in ^BY is used as the approximate symbol height.</p>
<b>s</b> = quality level	<p><b>Values:</b> 0, 50, 80, 100, 140, 200</p> <p><b>Default:</b> 0</p> <p><i>Quality</i> refers to the amount of data that is added to the symbol for error correction. The AIM specification refers to it as the ECC value. ECC 50, ECC 80, ECC 100, and ECC 140 use convolution encoding; ECC 200 uses Reed-Solomon encoding. For new applications, ECC 200 is recommended. ECC 000-140 should be used only in closed applications where a single party controls both the production and reading of the symbols and is responsible for overall system performance.</p>
<b>c</b> = columns to encode	<p><b>Values:</b> 9 to 49</p> <p>Odd values only for quality 0 to 140 (10 to 144); even values only for quality 200.</p> <p>Odd values only for quality 0 to 140 (10 to 144); even values only for quality 200. The number of rows and columns in the symbol is automatically determined. You might want to force the number of rows and columns to a larger value to achieve uniform symbol size. In the current implementation, quality 0 to 140 symbols are square, so the larger of the rows or columns supplied are used to force a symbol to that size. If you attempt to force the data into too small of a symbol, no symbol is printed. If a value greater than 49 is entered, the rows or columns value is set to zero and the size is determined normally. If an even value is entered, it generates INVALID-P (invalid parameter). If a value less than 9 but not 0, or if the data is too large for the forced size, no symbol prints; if ^CV is active, INVALID-L prints.</p>
<b>r</b> = rows to encode	<b>Values:</b> 9 to 49

Parameters	Details
<b>f</b> = format ID (0 to 6) — not used with quality set at 200	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>1</b> = field data is numeric + space (0..9,") – No \&amp;"</li> <li><b>2</b> = field data is uppercase alphanumeric + space (A..Z,") – No \&amp;"</li> <li><b>3</b> = field data is uppercase alphanumeric + space, period, comma, dash, and slash (0..9,A..Z,".-/")</li> <li><b>4</b> = field data is upper-case alphanumeric + space (0..9,A..Z,") – no \&amp;"</li> <li><b>5</b> = field data is full 128 ASCII 7-bit set</li> <li><b>6</b> = field data is full 256 ISO 8-bit set</li> </ul> <p><b>Default:</b> <b>6</b></p>
<b>g</b> = escape sequence control character	<p><b>Values:</b> any character</p> <p><b>Default:</b> ~ (tilde)</p> <p>This parameter is used only if quality 200 is specified. It is the escape character for embedding special control sequences within the field data.</p> <p><b>Important</b> • A value must always be specified when using the escape sequence control character. If no value is entered, the command is ignored.</p> <p>The <b>g</b> parameter will continue to be underscore (_) for anyone with firmware version: V60.13.0.12, V60.13.0.12Z, V60.13.0.12B, V60.13.0.12ZB, or later.</p>
<b>a</b> = aspect ratio  <b>.16↑</b>  The <b>a</b> parameter is only supported in V60.16.5Z and V53.16.5Z or later.	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>1</b> = square</li> <li><b>2</b> = rectangular</li> </ul> <p><b>Default:</b> <b>1</b></p>

Table 11 •

ECC LEVEL	ID = 1	ID = 2	ID = 3	ID = 4	ID = 5	ID = 6
<b>0</b>	596	452	394	413	310	271
<b>50</b>	457	333	291	305	228	200
<b>80</b>	402	293	256	268	201	176
<b>100</b>	300	218	190	200	150	131
<b>140</b>	144	105	91	96	72	63

Maximum Field Sizes

**Example 1:** This is an example of a square Data Matrix bar code:

ZPL II CODE	DATA MATRIX BAR CODE
<pre> ^XA ^FO100,100 ^BXN,10,200 ^FDZEBRA TECHNOLOGIES CORPORATION 333 CORPORATE WOODS PARKWAY VERNON HILLS, IL 60061-3109^FS ^XZ </pre>	

**Example 2:** This is an example of a rectangle Data Matrix bar code:

ZPL II CODE	DATA MATRIX BAR CODE
<pre> ^XA ^FO100,100 ^BXN,10,200,,,,2 ^FDZEBRA TECHNOLOGIES CORPORATION 333 CORPORATE WOODS PARKWAY ^FS ^XZ </pre>	

#### Effects of ^BY on ^BX

w = module width (no effect)

r = ratio (no effect)

h = height of symbol

If the dimensions of individual symbol elements are not specified in the ^BY command, the height of symbol value is divided by the required rows/columns, rounded, limited to a minimum value of one, and used as the dimensions of individual symbol elements.

#### Field Data (^FD) for ^BX

##### Quality 000 to 140

- The \& and || can be used to insert carriage returns, line feeds, and the backslash, similar to the PDF417. Other characters in the control character range can be inserted only by using ^FH. Field data is limited to 596 characters for quality 0 to 140. Excess field data causes no symbol to print; if ^CV is active, INVALID-L prints. The field data must correspond to a user-specified format ID or no symbol prints; if ^CV is active, INVALID-C prints.
- The maximum field sizes for quality 0 to 140 symbols are shown in the table in the g parameter.

##### Quality 200

- If more than 3072 bytes are supplied as field data, it is truncated to 3072 bytes. This limits the maximum size of a numeric Data Matrix symbol to less than the 3116 numeric characters that the specification would allow. The maximum alphanumeric capacity is 2335 and the maximum 8-bit byte capacity is 1556.
- If **^FH** is used, field hexadecimal processing takes place before the escape sequence processing described below.
- The underscore is the default escape sequence control character for quality 200 field data. A different escape sequence control character can be selected by using parameter g in the **^BX** command.

The information that follows applies to firmware version: V60.13.0.12, V60.13.0.12Z, V60.13.0.12B, V60.13.0.12ZB, or later. The input string escape sequences can be embedded in quality 200 field data using the ASCII 95 underscore character ( \_) or the character entered in parameter g:

- **\_X** is the shift character for control characters (e.g., **\_@=NUL**, **\_G=BEL**, **\_0 is PAD**)
- **\_1** to **\_3** for FNC characters 1 to 3 (explicit FNC4, upper shift, is not allowed)
- FNC2 (Structured Append) must be followed by nine digits, composed of three-digit numbers with values between 1 and 254, that represent the symbol sequence and file identifier (for example, symbol 3 of 7 with file ID 1001 is represented by **\_2214001001**)
- 5NNN is code page NNN where NNN is a three-digit code page value (for example, Code Page 9 is represented by **\_5009**)
- **\_dNNN** creates ASCII decimal value NNN for a code word (must be three digits)
- **\_** in data is encoded by **\_\_** (two underscores)

The information that follows applies to all other versions of firmware. The input string escape sequences can be embedded in quality 200 field data using the ASCII 7E tilde character (~) or the character entered in parameter g:

- **~X** is the shift character for control characters (e.g., **~@=NUL**, **~G=BEL**, **~0 is PAD**)
- **~1** to **~3** for FNC characters 1 to 3 (explicit FNC4, upper shift, is not allowed)
- FNC2 (Structured Append) must be followed by nine digits, composed of three-digit numbers with values between 1 and 254, that represent the symbol sequence and file identifier (for example, symbol 3 of 7 with file ID 1001 is represented by **~2214001001**)
- 5NNN is code page NNN where NNN is a three-digit code page value (for example, Code Page 9 is represented by **~5009**)
- **~dNNN** creates ASCII decimal value NNN for a code word (must be three digits)
- **~** in data is encoded by **~** (tilde)

## ^BY – Bar Code Field Default

The ^BY command is used to change the default values for the module width (in dots), the wide bar to narrow bar width ratio and the bar code height (in dots). It can be used as often as necessary within a label format.

**Format:** ^BYw,r,h

Parameters	Details
w = module width (in dots)	<b>Values:</b> 1 to 10 <b>Initial Value at Power Up:</b> 2
r = wide bar to narrow bar width ratio	<b>Values:</b> 2.0 to 3.0, in 0.1 increments This parameter has no effect on fixed-ratio bar codes. <b>Default:</b> 3.0
h = bar code height (in dots)	<b>Initial Value at Power Up:</b> 10

For parameter r, the actual ratio generated is a function of the number of dots in parameter w, module width. See [Table 12 on page 143](#). Module width and height (w and h) can be changed at anytime with the ^BY command, regardless of the symbology selected.

**Example:** Set module width (w) to 9 and the ratio (r) to 2.4. The width of the narrow bar is 9 dots wide and the wide bar is 9 by 2.4, or 21.6 dots. However, since the printer rounds out to the nearest dot, the wide bar is actually printed at 22 dots. This produces a bar code with a ratio of 2.44 (22 divided by 9). This ratio is as close to 2.4 as possible, since only full dots are printed.

**Table 12 • Shows Module Width Ratios in Dots**

Ratio Selected (r)	Module Width in Dots (w)									
	1	2	3	4	5	6	7	8	9	10
<b>2.0</b>	2:1	2:1	2:1	2:1	2:1	2:1	2:1	2:1	2:1	2:1
<b>2.1</b>	2:1	2:1	2:1	2:1	2:1	2:1	2:1	2:1	2:1	2.1:1
<b>2.2</b>	2:1	2:1	2:1	2:1	2.2:1	2.16:1	2.1:1	2.12:1	2.1:1	2.2:1
<b>2.3</b>	2:1	2:1	2.3:1	2.25:1	2.2:1	2.16:1	2.28:1	2.25:1	2.2:1	2.3:1
<b>2.4</b>	2:1	2:1	2.3:1	2.25:1	2.4:1	2.3:1	2.28:1	2.37:1	2.3:1	2.4:1
<b>2.5</b>	2:1	2.5:1	2.3:1	2.5:1	2.4:1	2.5:1	2.4:1	2.5:1	2.4:1	2.5:1
<b>2.6</b>	2:1	2.5:1	2.3:1	2.5:1	2.6:1	2.5:1	2.57:1	2.5:1	2.5:1	2.6:1
<b>2.7</b>	2:1	2.5:1	2.6:1	2.5:1	2.6:1	2.6:1	2.57:1	2.65:1	2.6:1	2.7:1
<b>2.8</b>	2:1	2.5:1	2.6:1	2.75:1	2.8:1	2.6:1	2.7:1	2.75:1	2.7:1	2.8:1
<b>2.9</b>	2:1	2.5:1	2.6:1	2.75:1	2.8:1	2.8:1	2.85:1	2.87:1	2.8:1	2.9:1
<b>3.0</b>	3:1	3:1	3:1	3:1	3:1	3:1	3:1	3:1	3:1	3:1

**Comments** Once a ^BY command is entered into a label format, it stays in effect until another ^BY command is encountered.

## ^BZ – POSTAL Bar Code

The POSTAL bar code is used to automate the handling of mail. POSTAL codes use a series of tall and short bars to represent the digits.

- ^BZ supports a print ratio of 2.0:1 to 3.0:1.
- Field data (^FD) is limited to the width (or length, if rotated) of the label and by the bar code specification.

**Format:** ^BZ<sub>o</sub>,<sub>h</sub>,<sub>f</sub>,<sub>g</sub>,<sub>t</sub>

**Important** • If additional information about the POSTAL and PLANET bar code is required, go to [www.aimglobal.org](http://www.aimglobal.org), or contact the United States Postal Service <http://pe.usps.gov>. If additional information about the INTELLIGENT MAIL bar code is required, see: <http://ribbs.usps.gov/OneCodeSolution>.

Parameters	Details
<b>o</b> = orientation	<b>Values:</b> N = normal R = rotated 90 degrees (clockwise) I = inverted 180 degrees B = read from bottom up, 270 degrees <b>Default:</b> current ^FW value
<b>h</b> = bar code height (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> value set by ^BY
<b>f</b> = print interpretation line	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>g</b> = print interpretation line above code	<b>Values:</b> N = no Y = yes <b>Default:</b> N
<b>t</b> = Postal code type	<b>Values:</b> 0 = Postnet bar code 1 = Plant Bar Code 2 = Reserved 3 = USPS Intelligent Mail bar code <b>Default:</b> 0

**Example 1:** This is an example of a POSTNET bar code:

ZPL II CODE	POSTNET BAR CODE								
<pre>^XA ^FO100,100^BY3 ^BZN,40,Y,N ^FD12345^FS ^XZ</pre>	 12345								
POSTNET BAR CODE CHARACTERS									
0	1	2	3	4	5	6	7	8	9

**Example 2:** This is an example of a USPS Intelligent Mail bar code:

ZPL II CODE	USPS INTELLIGENT MAIL BAR CODE
<pre>^XA ^FO100,040^BZ,40,,,3 ^FD00123123456123456789^FS ^XZ</pre>	

## ^CC ~CC – Change Caret

The ^CC command is used to change the format command prefix. The default prefix is the caret (^).

**Format:** ^CCx or ~CCx

Parameters	Details
x = caret character change	<b>Values:</b> any ASCII character <b>Default:</b> a parameter is required. If a parameter is not entered, the next character received is the new prefix character.

**Example:** This is an example of how to change the format prefix to / from a ::

^XA

^CC/

/XZ

The forward slash (/) is set at the new prefix. Note the /XZ ending tag uses the new designated prefix character (/).

**Example:** This is an example of how to change the format prefix from ~ to a /:

~CC/

/XA/JUS/XZ

## ^CD ~CD – Change Delimiter

The ^CD and ~CD commands are used to change the delimiter character. This character is used to separate parameter values associated with several ZPL II commands. The default delimiter is a comma (,).

**Format:** ^CDA or ~CDA

Parameters	Details
a = delimiter character change	<b>Values:</b> any ASCII character <b>Default:</b> a parameter is required. If a parameter is not entered, the next character received is the new prefix character.

**Example:** This shows how to change the character delimiter to a semi-colon (;):

```
^XA  
^FO10,10  
^GB10,10,3  
^XZ  
^XA  
^CD;  
^FO10;10  
^GB10;10;3  
^XZ
```

- To save, the JUS command is required. Here is an example using JUS:  
~CD;  
^XA^JUS^XZ

## ^CF – Change Alphanumeric Default Font

The ^CF command sets the default font used in your printer. You can use the ^CF command to simplify your programs.

**Format:** ^CFF,h,w

Parameters	Details
f = specified default font	<b>Values:</b> A through Z and 0 to 9 <b>Initial Value at Power Up:</b> A
h = individual character height (in dots)	<b>Values:</b> 0 to 32000 <b>Initial Value at Power Up:</b> 9
w = individual character width (in dots)	<b>Values:</b> 0 to 32000 <b>Initial Value at Power Up:</b> 5 or last permanent saved value

Parameter f specifies the default font for every alphanumeric field. Parameter h is the default height for every alphanumeric field, and parameter w is the default width value for every alphanumeric field.

The default alphanumeric font is A. If you do not change the alphanumeric default font and do not use any alphanumeric field command (^AF) or enter an invalid font value, any data you specify prints in font A.

Defining only the height or width forces the magnification to be proportional to the parameter defined. If neither value is defined, the last ^CF values given or the default ^CF values for height and width are used.

**Example:** This is an example of ^CF code and the result of the code:

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^CFO,89 ^FO20,50 ^FDA GUIDE TO^FS ^FO20,150 ^FDTHE ZPL II^FS ^FO20,250 ^FDPROGRAMMING^FS ^FO20,350 ^FDLANGUAGE^FS ^XZ </pre>	<p>A GUIDE TO THE ZPL II PROGRAMMING LANGUAGE</p>

**Comments** Any font in the printer, including downloaded fonts, EPROM stored fonts, and fonts A through Z and 0 to 9, can also be selected with ^CW.

## ^CI – Change International Font/Encoding

Zebra printers can print fonts using international character sets: U.S.A.1, U.S.A.2, UK, Holland, Denmark/Norway, Sweden/Finland, Germany, France 1, France 2, Italy, Spain, and several other sets, including the Unicode character set.

The ^CI command enables you to call up the international character set you want to use for printing. You can mix character sets on a label.

A character within a font can be remapped to a different numerical position.

.14↑

In x.14 version of firmware and later, this command allows character remapping when parameter **a** = 0-13.

**Format:** ^CIA,s1,d1,s2,d2,...

Parameters	Details
<b>a</b> = desired character set   <b>Note</b> • These parameters are only valid when parameter <b>a</b> = 1 - 13	<p>Accepted values <b>0 - 12</b> are Zebra Code Page 850 with specific character replacements. For details, see <a href="#">International Character Sets on page 151</a> and/or <a href="#">Zebra Code Page 850 — Latin Character Set on page 1294</a>.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>0</b> = Single Byte Encoding - U.S.A. 1 Character Set</li> <li><b>1</b> = Single Byte Encoding - U.S.A. 2 Character Set</li> <li><b>2</b> = Single Byte Encoding - U.K. Character Set</li> <li><b>3</b> = Single Byte Encoding - Holland Character Set</li> <li><b>4</b> = Single Byte Encoding - Denmark/Norway Character Set</li> <li><b>5</b> = Single Byte Encoding - Sweden/Finland Character Set</li> <li><b>6</b> = Single Byte Encoding - Germany Character Set</li> <li><b>7</b> = Single Byte Encoding - France 1 Character Set</li> <li><b>8</b> = Single Byte Encoding - France 2 Character Set</li> <li><b>9</b> = Single Byte Encoding - Italy Character Set</li> <li><b>10</b> = Single Byte Encoding - Spain Character Set</li> </ul> <p>(parameter details continued on next page)</p> <p>c. The encoding is controlled by the conversion table (*.DAT). The correct table must be present for the conversion to function. The table generated by ZTools™ is the TrueType fonts internal encoding (Unicode).</p> <p>d. Shift-JIS encoding converts Shift-JIS to JIS and then looks up the JIS conversion in JIS.DAT. This table must be present for Shift-JIS to function.</p> <p>e. Supports ASCII transparency for Asian encodings. 7F and less are treated as single byte characters. 80 to FE is treated as the first byte of a 2 byte character 8000 to FEFF in the encoding table for Unicode.</p> <p>f. The ^CI17 command has been deprecated, along with the ^F8 and ^F16 commands that are required for the ^CI17 command to function. The recommended replacement is the ^CI28-30 commands.</p>

Parameters	Details
<b>a</b> = desired character set (continued)	<b>11</b> = Single Byte Encoding - Miscellaneous Character Set <b>12</b> = Single Byte Encoding - Japan (ASCII with Yen symbol) Character Set <b>13</b> = Zebra Code Page 850 (see <a href="#">page 1294</a> ) <b>14</b> = Double Byte Asian Encodings <sup>c</sup> <b>15</b> = Shift-JIS <sup>d</sup> <b>16</b> = EUC-JP and EUC-CN <sup>c</sup> <b>17</b> = Deprecated - UCS-2 Big Endian <sup>f</sup> <b>18 to 23</b> = Reserved <b>24</b> = Single Byte Asian Encodings <sup>c</sup> <b>25</b> = Reserved <b>26</b> = Multibyte Asian Encodings with ASCII Transparency <sup>c</sup> and <sup>e</sup> <b>27</b> = Zebra Code Page 1252 (see <a href="#">page 1298</a> ) <b>28</b> = Unicode (UTF-8 encoding) - Unicode Character Set <b>29</b> = Unicode (UTF-16 Big-Endian encoding) - Unicode Character Set <b>30</b> = Unicode (UTF-16 Little-Endian encoding) - Unicode Character Set <b>31</b> = Zebra Code Page 1250 (see <a href="#">page 1296</a> ) is supported for scalable fonts, such as Font 0, or a downloaded TrueType font. Bitmapped fonts (including fonts A-H) do <b>not</b> fully support Zebra Code Page 1250. This value is supported only on Zebra G-Series™ printers. <b>33</b> = Code Page 1251 <b>34</b> = Code page 1253 <b>35</b> = Code Page 1254 <b>36</b> = Code Page 1255
<b>.14↑</b> Values 28 to 30 are only supported in firmware version V60.14.x, V50.14.x, or later.	<b>Initial Value at Power Up:</b> 0
<b>.16↑</b> Values 31 to 36 are only supported in firmware version x.16.x or later.	
<b>s1</b> = source 1 (character output image)	<b>Values:</b> decimals 0 to 255
<b>d1</b> = destination 1 (character input)	<b>Values:</b> decimals 0 to 255
<b>s2</b> = source 2 (character output image)	<b>Values:</b> decimals 0 to 255
<b>d2</b> = destination 2 (character input)	<b>Values:</b> decimals 0 to 255
<b>...</b> = continuation of pattern	Up to 256 source and destination pairs can be entered in this command.

- c. The encoding is controlled by the conversion table (\*.DAT). The correct table must be present for the conversion to function. The table generated by ZTools™ is the TrueType fonts internal encoding (Unicode).
- d. Shift-JIS encoding converts Shift-JIS to JIS and then looks up the JIS conversion in **JIS.DAT**. This table must be present for Shift-JIS to function.
- e. Supports ASCII transparency for Asian encodings. 7F and less are treated as single byte characters. 80 to FE is treated as the first byte of a 2 byte character 8000 to FEFF in the encoding table for Unicode.
- f. The **^CI17** command has been deprecated, along with the **^F8** and **^F16** commands that are required for the **^CI17** command to function. The recommended replacement is the **^CI28-30** commands.

**.14↑**

80 to FF could mean quad byte in GB18030. The **^CI26** command can also be used to support the GB 18030 and Big5 HKSCS encodings. The GB 18030 uses the **GB18030.DAT** encoding table and BIG5 HKSCS uses the **BIG5HK.DAT** encoding table.

**.14↑**

The **^CI17** command has been deprecated, along with the **^F8** and **^F16** commands that are required for the **^CI17** command to function. The recommended replacement is the **^CI28-30** commands.

**.14↑**

We recommend that a **^CI** command (or Unicode BOM) is included at the beginning of each ZPL script. This is important when ZPL scripts with different encodings are being sent to a single printer. To assist in the interleaving of encoding schemes, the printer maintains two encoding states (**^CI0 - 28** and **^CI29 - 30**). It automatically acknowledges when it should switch encoding states, allowing it to distinguish between encodings, and maintains a **^CI** for each, but endianess is shared.

**Example:** This example remaps the Euro symbol (21) decimal to the dollar sign value (36) decimal. When the dollar sign character is sent to the printer, the Euro symbol prints:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^CI0,21,36 ^FO100,200^A0N50,50^FD\$0123^FS ^XZ</pre>	<b>€0123</b>

The font selected determines the shape and resolution of the printed symbol.

### International Character Sets

Hex	2	3	4	5	5	5	5	6	7	7	7	7
	3	0	0	B	C	D	E	0	B	C	D	E
CI0	#	0	@	[	¢	]	^	'	{	:	}	~
CI1	#	0	@	%	¢	%	^	'	%	%	%	~
CI2	£	0	@	[	¢	]	^	'	{	:	}	~
CI3	f	0	\$	[	IJ	]	^	'	{	ij	}	~
CI4	#	0	@	Æ	Ø	Å	^	'	æ	ø	å	~
CI5	Ü	0	É	Ä	Ö	Å	Ü	é	ä	ö	å	ü
CI6	#	0	\$	Ä	Ö	Ü	^	'	ä	ö	ü	ß
CI7	£	0	à	[	ç	]	^	'	é	í	ù	è
CI8	#	0	à	â	ç	ê	î	ô	é	û	è	û
CI9	£	0	\$	[	ç	é	^	'	ù	à	ò	è
CI10	#	0	\$	i	Ñ	¿	^	'	{	ñ	ç	~
CI11	£	0	É	Ä	Ö	Ü	^	'	ä	ë	í	ö
CI12	#	0	@	[	¥	]	^	'	{	:	}	~
CI13	#	0	@	[	\	]	^	'	{	:	}	~

Note • ^CI 13 = US keyboard

**Comments** The space character cannot be remapped for any font.

## ^CM – Change Memory Letter Designation

The ^CM command allows you to reassign a letter designation to the printer's memory devices. If a format already exists, you can reassign the memory device to the corresponding letter without forcing, altering, or recreating the format itself.

Using this command affects every subsequent command that refers to specific memory locations.

**Format:** ^CMa,b,c,d

Parameters	Details
a = memory alias for B:	<b>Values:</b> B:, E:, R:, A:, and <b>NONE</b> <b>Default:</b> B:
b = memory alias for E:	<b>Values:</b> B:, E:, R:, A:, and <b>NONE</b> <b>Default:</b> E:
c = memory alias for R:	<b>Values:</b> B:, E:, R:, A:, and <b>NONE</b> <b>Default:</b> R:
d = memory alias for A:	<b>Values:</b> B:, E:, R:, A:, and <b>NONE</b> <b>Default:</b> A:
e = multiple alias	<b>Values:</b> M, or no value <b>Default:</b> no value <ul style="list-style-type: none"> <li>• This parameter is supported on Xi4 and ZM400/ZM600 printers using firmware V53.17.7Z or later.</li> <li>• This parameter is supported on G-Series printers using firmware versions v56.17.7Z and v61.17.7Z or later.</li> <li>• This parameter is supported on printers using firmware V60.17.7Z or later.</li> </ul>

**Comments** Unless the e (multiple alias) parameter is used, when two or more parameters specify the same letter designator, all letter designators are set to their default values.

It is recommended that after entering the ^CM command, ^JUS is entered to save changes to EEPROM. Any duplicate parameters entered will reset the letter designations back to the default.

If any of the parameters are out of specification, the command is ignored.

**Example 1:** This example designates letter E: to point to the B: memory device, and the letter B: to point to the E:memory device.

```
^XA
^CME,B,R,A
^JUS
^XZ
```

- **Example 2:** This example designates that content sent to, or read from the B: or E: memory locations will be sent to or read from the E: memory location.

```
^XA  
^CME,E,R,A,M  
^JUS  
^XZ
```

- **Example 3:** This example designates that content sent to, or read from the A: or E: memory locations will be sent to or read from the E: memory location.

```
^XA  
^CMB,E,R,E,M  
^JUS  
^XZ
```

- **Example 4:** This example designates that content sent to, or read from the A:, B: or E: memory locations will be sent to or read from the E: memory location.

```
^XA  
^CME,E,R,E,M  
^JUS  
^XZ
```

**Note** • Examples 2, 3 and 4 are the only valid uses of the multiple alias parameter.

## ^CN – Cut Now

The ^CN causes the printer to cycle the media cutter.

**Important** • This command works only when the printer is in Print Mode Kiosk (^MMk). If the printer is not in Print Mode Kiosk, then using this command has no effect. See [^MM on page 297](#).

### Supported Devices

- KR403

**Format:** ^CNa

Parameters	Details
<b>a</b> = Cut Mode Override	<b>Values:</b> <b>0</b> = Use the “kiosk cut amount” setting from ^KV <b>1</b> = Ignore “kiosk cut amount” from ^KV and do a full cut  <b>Default:</b> none The command is ignored if parameters are missing or invalid.

## ^CO – Cache On

The ^CO command is used to change the size of the character cache. By definition, a *character cache* (referred to as cache) is a portion of the DRAM reserved for storing scalable characters. All printers have a default 40K cache that is always turned on. The maximum single character size that can be stored, without changing the size of the cache, is 450 dots by 450 dots.

There are two types of fonts used in Zebra printers: bitmapped and scalable. Letters, numbers, and symbols in a bitmapped font have a fixed size (for example: 10 points, 12 points, 14 points). By comparison, scalable fonts are not fixed in size.

Because their size is fixed, bitmapped fonts can be moved quickly to the label. In contrast, scalable fonts are much slower because each character is built on an as-needed basis before it is moved to the label. By storing scaled characters in a cache, they can be recalled at a much faster speed.

The number of characters that can be stored in the cache depends on two factors: the size of the cache (memory) and the size of the character (in points) being saved. The larger the point size, the more space in the cache it uses. The default cache stores every scalable character that is requested for use on a label. If the same character, with the same rotation and size is used again, it is quickly retrieved from cache.

It is possible that after a while the print cache could become full. Once the cache is full, space for new characters is obtained by eliminating an existing character from the print cache. Existing characters are eliminated by determining how often they have been used. This is done automatically. For example, a 28-point Q that was used only once would be a good candidate for elimination from the cache.

Maximum size of a single print cache character is 1500 dots by 1500 dots. This would require a cache of 274K. When the cache is too small for the desired style, smaller characters might appear but larger characters do not. If possible, increase the size of the cache.

**Format:** ^COa,b,c

Parameters	Details
a = cache on	<b>Values:</b> N = no Y = yes <b>Default:</b> Y
b = amount of additional memory to be added to cache (in K)	<b>Values:</b> 1 to 9999 <b>Default:</b> 40
c = cache type	<b>Values:</b> 0 = cache buffer (normal fonts) 1 = internal buffer (recommended for Asian fonts) <b>Default:</b> 0

→ **Example:** To resize the print cache to 62K, assuming a 22K existing cache:  
`^COY,40`

To resize the print cache to 100K, assuming a 22K existing cache:  
`^COY,78`

### Print Cache Performance

For printing large characters, memory added to the cache by the `^CO` command is not physically added to the 22K cache already in the printer. In the second example above, the resulting 100K cache is actually two separate blocks of memory, 22K and 78K.

Because large characters need contiguous blocks of memory, a character requiring a cache of 90K would not be completely stored because neither portion of the 100K cache is big enough. Therefore, if large characters are needed, the `^CO` command should reflect the actual size of the cache you need.

Increasing the size of the cache improves the performance in printing scalable fonts. However, the performance decreases if the size of the cache becomes large and contains too many characters. The performance gained is lost because of the time involved searching the cache for each character.

**Comments** The cache can be resized as often as needed. Any characters in the cache when it is resized are lost. Memory used for the cache reduces the space available for label bitmaps, graphic, and fonts.

Some Asian fonts require an internal working buffer that is much larger than the normal cache. Since most fonts do not require this larger buffer, it is now a selectable configuration option. Printing with the Asian fonts greatly reduces the printer memory available for labels, graphics, fonts, formats, and label bitmaps.

**Note** • If you have firmware x.12 or greater this command is not required because the printer firmware automatically expands the size of the character cache as needed.

## ^CP – Remove Label

The ^CP command causes the printer to move a printed label out of the presenter area in one of several ways.

### Supported Devices

- KR403

**Format:** ^CPa

Parameters	Details
a = kiosk present mode	<p><b>Values:</b></p> <p><b>0</b> = Eject presented page <b>1</b> = Retracts presented page <b>2</b> = Takes the action defined by c parameter of ^KV command.</p> <p><b>Default:</b> none</p> <p>The command is ignored if parameters are missing or invalid.</p>

## ^CT ~CT – Change Tilde

The ^CT and ~CT commands are used to change the control command prefix. The default prefix is the tilde (~).

**Format:** ^CTa or ~CTa

Parameters	Details
a = change control command character	<b>Values:</b> any ASCII character <b>Default:</b> a parameter is required. If a parameter is not entered, the next character received is the new control command character.

→ **Example:** This is an example of how to change the control command prefix from a ^ to a +:

```
^XA  
^CT+  
^XZ  
+HS
```

## ^CV – Code Validation

The ^CV command acts as a switch to turn the code validation function on and off. When this command is turned on, all bar code data is checked for these error conditions:

- character not in character set
- check-digit incorrect
- data field too long (too many characters)
- data field too short (too few characters)
- parameter string contains incorrect data or missing parameter

When invalid data is detected, an error message and code is printed in reverse image in place of the bar code. The message reads **INVALID - X** where X is one of these error codes:

- C** = character not in character set  
**E** = check-digit incorrect  
**L** = data field too long  
**S** = data field too short  
**P** = parameter string contains incorrect data  
(occurs only on select bar codes)

Once turned on, the ^CV command remains active from format to format until turned off by another ^CV command or the printer is turned off. The command is not permanently saved.

**Format:** ^CVa

Parameters	Details
a = code validation	<b>Values:</b> N = no Y = yes <b>Default:</b> N

→ **Example:** The examples below show the error labels ^CVY generates when incorrect field data is entered. Compare the letter following *INVALID* – to the listing on the previous page.

ZPL II CODE	GENERATED LABEL
<pre>^XA ^CVY ^FO50,50 ^BEN,100,Y,N ^FD97823456 890^FS ^XZ</pre>	INVALID - C
<pre>^XA ^CVY ^FO50,50 ^BEN,100,Y,N ^FD9782345678907^FS ^XZ</pre>	INVALID - E
<pre>^XA ^CVY ^FO50,50 ^BEN,100,Y,N ^FD97823456789081^FS ^XZ</pre>	INVALID - L
<pre>^XA ^CVY ^FO50,50 ^BEN,100,Y,N ^FD97823456789^FS ^XZ</pre>	INVALID - S
<pre>^XA ^CVY ^FO50,50 ^BQN2,3 ^FDHM,BQRCode-22^FS ^XZ</pre>	INVALID - P

**Comments** If more than one error exists, the first error detected is the one displayed.

The ^CV command tests the integrity of the data encoded into the bar code. It is not used for (or to be confused with) testing the scan-integrity of an image or bar code.

## ^CW – Font Identifier

All built-in fonts are referenced using a one-character identifier. The ^CW command assigns a single alphanumeric character to a font stored in DRAM, memory card, EPROM, or Flash.

If the assigned character is the same as that of a built-in font, the downloaded font is used in place of the built-in font. The new font is printed on the label wherever the format calls for the built-in font. If used in place of a built-in font, the change is in effect only until power is turned off.

If the assigned character is different, the downloaded font is used as an additional font. The assignment remains in effect until a new command is issued or the printer is turned off.

**Format:** ^CWA,d:o.x

Parameters	Details
a = letter of existing font to be substituted, or new font to be added	<b>Values:</b> A through Z and 0 to 9 <b>Default:</b> a one-character entry is required
d = device to store font in (optional)	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
o = name of the downloaded font to be substituted for the built-in, or as an additional font	<b>Values:</b> any name up to 8 characters <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension  <b>.14†</b> .TTE is only supported in firmware version V60.14.x, V50.14.x, or later.	<b>Values:</b> .FNT = Font .TTF = TrueType Font .TTE = TrueType Extension

**Example:** These examples show how to use:

- **MYFONT.FNT** stored in DRAM whenever a format calls for Font A:  
  ^XA  
  ^CWA,R:MYFONT.FNT  
  ^XZ
- **MYFONT.FNT** stored in DRAM additionally as Font Q:  
  ^XA  
  ^CWQ,R:MYFONT.FNT  
  ^XZ
- **NEWFONT.FNT** stored in DRAM whenever a format calls for font F:  
  ^XA  
  ^CWF,R:NEWFONT.FNT  
  ^XZ

## ~DB – Download Bitmap Font

The **~DB** command sets the printer to receive a downloaded bitmap font and defines native cell size, baseline, space size, and copyright.

This command consists of two portions, a ZPL II command defining the font and a structured data segment that defines each character of the font.

**Format:** ~DBd:o.x,a,h,w,base,space,#char,@,data

Parameters	Details
<b>d</b> = drive to store font	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
<b>o</b> = name of font	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
<b>x</b> = extension	<b>Format:</b> .FNT
<b>a</b> = orientation of native font	<b>Fixed Value:</b> normal
<b>h</b> = maximum height of cell (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> a value must be specified
<b>w</b> = maximum width of cell (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> a value must be specified
<b>base</b> = dots from top of cell to character baseline	<b>Values:</b> 1 to 32000 <b>Default:</b> a value must be specified
<b>space</b> = width of space or non-existent characters	<b>Values:</b> 1 to 32000 <b>Default:</b> a value must be specified
<b>#char</b> = number of characters in font	<b>Values:</b> 1 to 256 (must match the characters being downloaded) <b>Default:</b> a value must be specified
<b>@</b> = copyright holder	<b>Values:</b> 1 to 63 alphanumeric characters <b>Default:</b> a value must be specified

Parameters	Details
<b>data</b> = structured ASCII data that defines each character in the font	<p>The # symbol signifies character code parameters, which are separated with periods. The character code is from 1 to 4 characters to allow for large international character sets to be downloaded to the printer.</p> <p>The data structure is:</p> <pre>#xxxx.h.w.x.y.i.data #xxxx = character code h = bitmap height (in dot rows) w = bitmap width (in dot rows) x = x-offset (in dots) y = y-offset (in dots) i = typesetting motion displacement (width, including inter character gap of a particular character in the font) data = hexadecimal bitmap description</pre>

→ **Example:** This is an example of how to use the ~DB command. It shows the first two characters of a font being downloaded to DRAM.

```
~DBR:TIMES.FNT,N,5,24,3,10,2,ZEBRA 1992,
#0025.5.16.2.5.18.
0OFF
0OFF
FF00
FF00
FFFF
#0037.4.24.3.6.26.
0OFFOO
OFOOFO
OFOOFO
0OFFOO
```

## ~DE – Download Encoding

The standard encoding for TrueType Windows® fonts is always Unicode. The ZPL II field data must be converted from some other encoding to Unicode that the Zebra printer understands. The required translation tables are provided with font packs. Some tables can be downloaded from [www.zebra.com](http://www.zebra.com).

**Format:** ~DEd:o.x,s,data

Parameters	Details
<b>d</b> = location of table	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
<b>o</b> = name of table	<b>Values:</b> any valid name, up to 8 characters <b>Default:</b> if a name is not specified, UNKNOWN is used
<b>x</b> = extension	<b>Format:</b> .DAT
<b>s</b> = table size	<b>Values:</b> the number of memory bytes required to hold the Zebra downloadable format of the font <b>Default:</b> if an incorrect value or no value is entered, the command is ignored
<b>data</b> = data string	<b>Values:</b> a string of ASCII hexadecimal values <b>Default:</b> if no data is entered, the command is ignored

**Example:** This is an example of how to download the required translation table:

**~DER:JIS.DAT,27848,300021213001...**

(27848 two-digit hexadecimal values)

**Comments** For more information on ZTools or ZebraNet Bridge, see the program documentation included with the software.

For assistance with editing or adding mappings to .DAT tables, ZebraNet Bridge includes a .DAT table editor in the font wizard.

Encoding scheme for the data sent to the printer is the second four character and the encoding scheme for the font is the first four characters throughout the .DAT file. The data must be ordered by the second four characters (the encoding table).

→ **Example:** This is an example of a .DAT table. The table below the example identifies the elements:

```
~DEE:EXAMPLE.DAT,16,
```

00310041	1
00320042	2
00330043	3
00340044	4

1	Input stream with <b>0041</b> will be mapped to 0031. The printer prints "1".
2	Input stream with <b>0042</b> will be mapped to 0032. The printer prints "2".
3	Input stream with <b>0043</b> will be mapped to 0033. The printer prints "3".
4	Input stream with <b>0044</b> will be mapped to 0034. The printer prints "4".

Data must have 0041, 0042, 0043, and 0044 in order. Multiple pairs can be on the same line.

## ^DF – Download Format

The ^DF command saves ZPL II format commands as text strings to be later merged using ^XF with variable data. The format to be stored might contain field number (^FN) commands to be referenced when recalled.

While use of stored formats reduces transmission time, no formatting time is saved—this command saves ZPL II as text strings formatted at print time.

Enter the ^DF stored format command immediately after the ^XA command, then enter the format commands to be saved.

**Format:** ^DFd:o.x

Parameters	Details
d = device to store image	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
o = image name	<b>Values:</b> 1 to 16 alphanumeric characters with a file type of 1 to 3 alphanumeric characters separated by a "." <b>Default:</b> if a name is not specified, UNKNOWN is used.
x = extension	<b>Format:</b> .ZPL

For a complete example of the ^DF and ^XF command, see [^DF and ^XF – Download format and recall format on page 51](#).

**Example:** This example is generated using the ^XF command to recall this format:

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^DFR:STOREFMT.ZPL^FS ^FO25,25 ^AD,36,20^FN1^FS ^FO165,25 ^AD,36,20^FN2^FS ^FO25,75 ^AB,22,14^FD BUILT BY^FS ^FO25,125 ^AE,28,15^FN1 ^XZ ^XA ^XFR:STOREFMT.ZPL^FS ^FN1^FD ZEBRA^FS ^XZ </pre>	<p>ZEBRA PRINTER BUILT BY ZEBRA</p>

## ~DG – Download Graphics

The ~DG command downloads an ASCII Hex representation of a graphic image. If .GRF is not the specified file extension, .GRF is automatically appended.

For more saving and loading options when downloading files, see [~DY on page 176](#).

**Format:** ~DGd:o.x,t,w,data

Parameters	Details
<b>d</b> = device to store image	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
<b>o</b> = image name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
<b>x</b> = extension	<b>Format:</b> .GRF
<b>t</b> = total number of bytes in graphic	See the formula in the examples below.
<b>w</b> = number of bytes per row	See the formula in the examples below.
<b>data</b> = ASCII hexadecimal string defining image	The data string defines the image and is an ASCII hexadecimal representation of the image. Each character represents a horizontal nibble of four dots.

This is the key for the examples that follow:

- x = width of the graphic in millimeters
- y = height of the graphic in millimeters
- z = dots/mm = print density of the printer being programmed
- 8 = bits/byte

**Examples:** These are some example related to the ~DG command:

To determine the **t** parameter use this formula:

$$\frac{xz}{8} \times yz = \text{totalbytes}$$

To determine the correct **t** parameter for a graphic 8 mm wide, 16 mm high, and a print density of 8 dots/mm, use this formula:

$$8 \times 128 = 1024$$

$$t = 1024$$

**Raise any portion of a byte to the next whole byte.**

To determine the **w** parameter (the width in terms of bytes per row) use this formula:

$$\frac{xz}{8} = (\text{totalbytes}) / (\text{row})$$

$$w = 8$$

To determine the correct **w** parameter for a graphic 8 mm wide and a print density of 8 dots/mm, use this formula:

$$\frac{8 \times 8}{8} = 8 \text{ bytes}$$

$$w = 8$$

**Raise any portion of a byte to the next whole byte.**

Parameter **w** is the first value in the **t** calculation.

The data parameter is a string of hexadecimal numbers sent as a representation of the graphic image. Each hexadecimal character represents a horizontal nibble of four dots. For example, if the first four dots of the graphic image are white and the next four black, the dot-by-dot binary code is 00001111. The hexadecimal representation of this binary value is 0F. The entire graphic image is coded in this way, and the complete graphic image is sent as one continuous string of hexadecimal values.

This is an example of using the ~DG command to load a checkerboard pattern into DRAM. The name used to store the graphic is **SAMPLE.GRF**:

ZPL II CODE	GENERATED LABEL
<pre>~DGR:SAMPLE.GRF,00080,010, FFFFFFFFFFFFFFFF 8000FFFF0000FFFF0001 8000FFFF0000FFFF0001 8000FFFF0000FFFF0001 FFFF0000FFFF0000FFFF FFFF0000FFFF0000FFFF FFFF0000FFFF0000FFFF FFFFFFFFFFFFFFFF ^XA ^FO20,20^XGR:SAMPLE.GRF,1,1^FS ^XZ</pre>	

**Comments** Do not use spaces or periods when naming your graphics. Always use different names for different graphics.

If two graphics with the same name are sent to the printer, the first graphic is erased and replaced by the second graphic.

## ~DN – Abort Download Graphic

After decoding and printing the number of bytes in parameter **t** of the ~DG command, the printer returns to normal Print Mode. Graphics Mode can be aborted and normal printer operation resumed by using the ~DN command.

**Format:** ~DN

**Comments** If you need to stop a graphic from downloading, you should abort the transmission from the host device. To clear the ~DG command, however, you must send a ~DN command.

## ~DS – Download Intellifont (Scalable Font)

The **~DS** command is used to set the printer to receive a downloadable scalable font and defines the size of the font in bytes.

The **~DS** command, and its associated parameters, is the result of converting a vendor-supplied font for use on a Zebra printer. To convert this font use the ZTools utility.

**Format:** ~DSd:o.x,s,data

Parameters	Details
<b>d</b> = device to store image	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
<b>o</b> = image name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
<b>x</b> = extension	<b>Fixed Value:</b> .FNT
<b>s</b> = size of font in bytes	<b>Fixed Value:</b> this number is generated by ZTools and should not be changed
<b>data</b> = ASCII hexadecimal string that defines font	<b>Fixed Value:</b> this number is generated by ZTools and should not be changed

**Example:** This example shows the first three lines of a scalable font that was converted using the ZTools program and is ready to be downloaded to the printer. If necessary, the destination and object name can be changed.

```
~DSB:CGTIMES.FNT,37080,
0OFFOOFFFOOFFFOOFF
FFOAECB28FFF0OFF
```

**Comments** Downloaded scalable fonts are not checked for integrity. If they are corrupt, they cause unpredictable results at the printer.

.14↑

If you are using a TrueType font use these commands: **~DT**, **~DU**, and **~DY**. To determine when to use the noted commands, see [~DT on page 174](#), [~DU on page 175](#), and [~DY on page 176](#).

## ~DT – Download Bounded TrueType Font

Use ZTools to convert a TrueType font to a Zebra-downloadable format. that has less than 256 characters in it. To convert a font that has more than 256 characters, see [~DU on page 175](#). ZTools creates a downloadable file that includes a ~DT command. For information on converting and downloading Intellifont information, see [~DS on page 173](#).

**Format:** ~DTd:o.x,s,data

Parameters	Details
<b>d</b> = font location	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
<b>o</b> = font name	<b>Values:</b> any valid TrueType name, up to 8 characters <b>Default:</b> if a name is not specified, UNKNOWN is used
<b>x</b> = extension	<b>Fixed Value:</b> .DAT
<b>s</b> = font size	<b>Values:</b> the number of memory bytes required to hold the Zebra-downloadable format of the font <b>Default:</b> if an incorrect value or no value is entered, the command is ignored
<b>data</b> = data string	<b>Values:</b> a string of ASCII hexadecimal values (two hexadecimal digits/byte). The total number of two-digit values must match parameter <b>s</b> . <b>Default:</b> if no data is entered, the command is ignored

**Example:** This is an example of how to download a true type font:

**~DTR:FONT,52010,00AF01B0C65E...**

(52010 two-digit hexadecimal values)

## ~DU – Download Unbounded TrueType Font

Some international fonts, such as Asian fonts, have more than 256 printable characters. These fonts are supported as *large TrueType fonts* and are downloaded to the printer with the ~DU command. Use ZTools to convert the large TrueType fonts to a Zebra-downloadable format.

The Field Block (^FB) command cannot support the large TrueType fonts.

**Format:** ~DUD:o.x,s,data

Parameters	Details
d = font location	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
o = font name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension	<b>Format:</b> .FNT
s = font size	<b>Values:</b> the number of memory bytes required to hold the Zebra-downloadable format of the font <b>Default:</b> if no data is entered, the command is ignored
data = data string	<b>Values:</b> a string of ASCII hexadecimal values (two hexadecimal digits/byte). The total number of two-digit values must match parameter s. <b>Default:</b> if no data is entered, the command is ignored

**Example:** This is an example of how to download an unbounded true type font:

~DUR:KANJI,86753,60CA017B0CE7...

(86753 two-digit hexadecimal values)

For similar commands, see [~DS on page 173](#), [~DT on page 174](#), and [~DY on page 176](#).

## ~DY – Download Objects

The **~DY** command downloads to the printer graphic objects or fonts in any supported format. This command can be used in place of **~DG** for more saving and loading options. **~DY** is the preferred command to download TrueType fonts on printers with firmware later than X.13. It is faster than **~DU**. The **~DY** command also supports downloading wireless certificate files.

**Note** • When using certificate files, your printer supports:

- Using Privacy Enhanced Mail (PEM) formatted certificate files.
- Using the client certificate and private key as two files, each downloaded separately.
- Using exportable PAC files for EAP-FAST.
- Zebra recommends using Linear style memory devices for storing larger objects.

**Format:** ~DYd:f,b,x,t,w,data

Parameters	Details
<b>d</b> = file location  .15↑  .NRD and .PAC files reside on E: in firmware versions V60.15.x, V50.15.x, or later.	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
<b>f</b> = file name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
<b>b</b> = format downloaded in data field  .14↑  .TTE and .TTF are only supported in firmware versions V60.14.x, V50.14.x, or later.	<b>Values:</b> A = uncompressed (ZB64, ASCII) B = uncompressed (.TTE, .TTF, binary) C = AR-compressed (used only by Zebra's BAR-ONE® v5) P = portable network graphic (.PNG) - ZB64 encoded <b>Default:</b> a value must be specified

Parameters	Details
<p>x = extension of stored file</p> <p>.14↑</p> <p>.TTE and .OTF are only supported in firmware versions V60.14.x, V50.14.x, or later.</p> <p>.15↑</p> <p>.NRD and .PAC are only supported in firmware versions V60.15.x, V50.15.x, or later.</p>	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>B = bitmap</li> <li>E = TrueType Extension (.TTE)</li> <li>G = raw bitmap (.GRF)</li> <li>P = store as compressed (.PNG)</li> <li>T = TrueType (.TTF) or OpenType (.OTF)</li> <li>X = Paintbrush (.PCX)</li> <li>NRD = Non Readable File (.NRD)</li> <li>PAC = Protected Access Credential (.PAC)</li> <li>C = User defined menu file (WML)</li> <li>F = User defined webpage file (HTM)</li> <li>H = Printer feedback file (GET)</li> </ul> <p><b>Default:</b> a value other than the accepted values defaults to .GRF</p>
<p>t = total number of bytes in file</p> <p>.14↑</p> <p>.TTE is only supported in firmware versions V60.14.x, V50.14.x, or later.</p>	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>.BMP</b> This parameter refers to the actual size of the file, not the amount of disk space.</li> <li><b>.GRF images:</b> the size after decompression into memory This parameter refers to the actual size of the file, not the amount of disk space.</li> <li><b>.PCX</b> This parameter refers to the actual size of the file, not the amount of disk space.</li> <li><b>.PNG images:</b> This parameter refers to the actual size of the file, not the amount of disk space.</li> <li><b>.TTF</b> This parameter refers to the actual size of the file, not the amount of disk space.</li> <li><b>.TTE</b> This parameter refers to the actual size of the file, not the amount of disk space.</li> </ul>

Parameters	Details
w = total number of bytes per row  .141  .TTE is only supported in firmware version V60.14.x, V50.14.x, or later.	<b>Values:</b> .GRF images: number of bytes per row .PNG images: value ignored .TTF images: value ignored .TTE images: value ignored .NRD images: value ignored .PAC images: value ignored
.151  .NRD and .PAC files are supported in firmware version V60.15.x, V50.15.x, or later.	
data = data	ASCII hexadecimal encoding, ZB64, or binary data, depending on b. A, P = ASCII hexadecimal or ZB64 B, C = binary When binary data is sent, all control prefixes and flow control characters are ignored until the total number of bytes needed for the graphic format is received.

**Note** • When transmitting fonts or graphics, the ~DY command and the binary content can be sent as two separate data streams. In cases where the ~DY command and data content are sent separately, the connection to the printer must be maintained until both the command and data content have been sent. If the command and data content are sent separately, the data light on the printer will remain lit until it receives all the data called for in the ~DY command. The download will be considered complete when the number of bytes called out in the ~DY command have been received.

For best results, graphic files must be monochrome (black and white) or dithered.

**Example:** This is an example of how to download a binary TrueType Font file of Size bytes using the name fontfile.ttf and storing it to permanent flash memory on the printer:

**~DYE:FONTPFILE.TTF,B,T,SIZE,,**

**Examples:** These examples show:

- that when the **^IM** command is used with the **^FO** command, the **^IM** command (see [^IM on page 241](#)) moves the **logo.png** file from a storage area to the 0,0 position on the label. This is the ZPL code:

```
^XA  
^FO0,0^IMR:LOGO.PNG^FS  
^XZ
```

- that when the **^IL** command (see [^IL on page 240](#)) is used at the beginning of a label format, it loads a stored image (**logo.png**) of a format and merges it with additional data. It is automatically positioned at the 0,0 position of the label and does not require the **^FO** command. This is the ZPL code:

```
^XA  
^ILR:LOGO.PNG  
^XZ
```

**Comments** For more information on ZB64 encoding and compression, see [ZB64 Encoding and Compression on page 1337](#).

.14↑

These are some important things to know about this command in firmware version V60.14.x, V50.14.x, or later:

- ZebraNet Bridge can be used to download fonts and graphics with this command.
- OpenType tables are only supported when downloading the font with this command
- OpenType fonts (.OTF) are supported if they are downloaded as a TrueType font. In the printer .OTF fonts have the .TTF extension.

## ~EG – Erase Download Graphics

See [^ID on page 238](#).

## ^FB – Field Block

The ^FB command allows you to print text into a defined *block type* format. This command formats an ^FD or ^SN string into a block of text using the origin, font, and rotation specified for the text string. The ^FB command also contains an automatic word-wrap function.

**Format:** ^FBa,b,c,d,e

Parameters	Details
a = width of text block line (in dots)	<b>Values:</b> 0 to the width of the label <b>Default:</b> 0 If the value is less than font width or not specified, text does not print.
b = maximum number of lines in text block	<b>Values:</b> 1 to 9999 <b>Default:</b> 1 Text exceeding the maximum number of lines overwrites the last line. Changing the font size automatically increases or decreases the size of the block.
c = add or delete space between lines (in dots)	<b>Values:</b> -9999 to 9999 <b>Default:</b> 0 Numbers are considered to be positive unless preceded by a minus sign. Positive values add space; negative values delete space.
d = text justification	<b>Values:</b> L = left C = center R = right J = justified <b>Default:</b> L If J is used the last line is left-justified.
e = hanging indent (in dots) of the second and remaining lines	<b>Values:</b> 0 to 9999 <b>Default:</b> 0

**Example:** These are examples of how the ^FB command affects field data.

ZPL II CODE	GENERATED LABEL
<pre>^XA ^CFO,30,30^FO25,50 ^FB250,4, ^FD command that IS\&amp; preceded by an FB \&amp;command. ^FS ^XZ</pre>	<p>FD command that IS preceded by an FB command.</p>
<pre>^XA ^CFO,30,30^FO25,50 ^FD command that IS NOT preceded by an FB command.^FS ^XZ</pre>	<p>FD command that IS NOT preceded by an FB cor</p>

### Comments

This scheme can be used to facilitate special functions:

- \& = carriage return/line feed
- \(\*) = soft hyphen (word break with a dash)
- \\" = backslash (\)

**Item 1:** ^CI13 must be selected to print a backslash (\).

**Item 2:** If a soft hyphen escape sequence is placed near the end of a line, the hyphen is printed. If it is not placed near the end of the line, it is ignored.

(\*) = any alphanumeric character

- If a word is too long to print on one line by itself (and no soft hyphen is specified), a hyphen is automatically placed in the word at the right edge of the block. The remainder of the word is on the next line. The position of the hyphen depends on word length, not a syllable boundary. Use a soft hyphen within a word to control where the hyphenation occurs.
- Maximum data-string length is 3K, including control characters, carriage returns, and line feeds.
- Normal carriage returns, line feeds, and *word spaces* at line breaks are discarded.
- When using ^FT (Field Typeset), ^FT uses the baseline origin of the last possible line of text. Increasing the font size causes the text block to increase in size from bottom to top. This could cause a label to print past its top margin.
- When using ^FO (Field Origin), increasing the font size causes the text block to increase in size from top to bottom.
- ^FS terminates an ^FB command. Each block requires its own ^FB command.

.14↑

While the **^FB** command has a text justification parameter that defines the justification of the text within the block, it also interacts with the justification of **^FO** and **^FT** that define the justification of the origin.

The **^FB** command does not support soft hyphens as a potential line break point. However, soft hyphen characters are always printed as if they were a hyphen.

The **^FB** command does not support complex text. For complex text support, use **^TB**.

## ^FC – Field Clock

The ^FC command is used to set the clock-indicators (delimiters) and the clock mode for use with the Real-Time Clock hardware. This command must be included within each label field command string each time the Real-Time Clock values are required within the field.

**Format:** ^FCa,b,c

Parameters	Details
a = primary clock indicator character	<b>Values:</b> any ASCII character <b>Default:</b> %
b = secondary clock indicator character	<b>Values:</b> any ASCII character <b>Default:</b> none—this value cannot be the same as a or c
c = third clock indicator character	<b>Values:</b> any ASCII character <b>Default:</b> none—this value cannot be the same as a or b

**Example:** Entering these ZPL commands sets the primary clock indicator to %, the secondary clock indicator to {, and the third clock indicator to #. The results are printed on a label with Primary, Secondary, and Third as field data.

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^FO10,100^AON,50,50 ^FC%,{,# ^FDPrimary: %m/%d/%y^FS ^FO10,200^AON,50,50 ^FC%,{,# ^FDSecondary: {m/{d/{y^FS ^FO10,300^AON,50,50 ^FC%,{,# ^FDThird: #m/#d/#y^FS ^XZ </pre>	<p style="text-align: center;"><b>Primary: 00/00/00</b></p> <p style="text-align: center;"><b>Secondary: 01/01/00</b></p> <p style="text-align: center;"><b>Third: 01/01/00</b></p>

**Comments** The ^FC command is ignored if the Real Time Clock hardware is not present. As of V60.13.0.10, (^SN) functions with (^FC) capabilities.

For more details on the Real Time Clock, see [Real Time Clock on page 1347](#).

## ^FD – Field Data

The ^FD command defines the data string for a field. The field data can be any printable character except those used as command prefixes (^ and ~).

In RFID printers, it can also be used to specify passwords to write to tags.

**Format:** ^FDa

Parameters	Details
<b>a =</b> <ul style="list-style-type: none"><li>• data to be printed (all printers), or</li><li>• a password to be written to a RFID tag (rfid printers)</li></ul>	<b>Values:</b> any data string up to 3072 bytes <b>Default:</b> none—a string of characters must be entered

**Comments** The ^ and ~ characters can be printed by changing the prefix characters—see [^CD ~CD on page 147](#) and [^CT ~CT on page 159](#). The new prefix characters cannot be printed.

Characters with codes above 127, or the ^ and ~ characters, can be printed using the ^FH and ^FD commands.

- ^CI13 must be selected to print a backslash (\).

For information on using soft hyphens, see [Comments on the ^FB command on page 182](#).

## ^FH – Field Hexadecimal Indicator

The ^FH command allows you to enter the hexadecimal value for any character directly into the ^FD statement. The ^FH command must precede each ^FD command that uses hexadecimals in its field.

Within the ^FD statement, the hexadecimal indicator must precede each hexadecimal value. The default hexadecimal indicator is \_ (underscore). There must be a minimum of two characters designated to follow the underscore. The a parameter can be added when a different hexadecimal indicator is needed.

This command can be used with any of the commands that have field data (that is ^FD, ^FV (Field Variable), and ^SN (Serialized Data)).

Valid hexadecimal characters are:

0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f

**Format:** ^FH<sub>a</sub>

Parameters	Details
<b>a</b> = hexadecimal indicator	<b>Values:</b> any character except current format and control prefix (^ and ~ by default) <b>Default:</b> _ (underscore)

**Example:** This is an example of how to enter a hexadecimal value directly into a ^FD statement: This is an example for ascii data using ^CI0.

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO100,100 ^AD^FH ^FDtilde _7e used for HEX^FS ^XZ</pre>	<p>Tilde ~ used for HEX</p>
<pre>^XA ^FO100,100 ^AD^FH\ ^FDtilde \7E used for HEX^FS ^XZ</pre>	<p>Tilde ~ used for HEX</p>

**Examples:** These are examples of how ^FH works with UTF-8 and UTF-16BE:

#### UTF-8

ZPL II CODE	GENERATED LABEL
<pre>^XA ^CI28 ^LL500 ^FO100,100 ^AA,20,20 ^FH^FDU+00A1 in UTF8 = _C2_A1^FS ^XZ</pre>	<pre>U+00A1 in UTF8 = i</pre>

#### UTF-16BE

ZPL II CODE	GENERATED LABEL
<pre>^XA ^CI29 ^LL500 ^FO100,100 ^AA,20,20 ^FH^FDU+00A1 in UTF16BE = _00_A1^FS ^XZ</pre>	<pre>U+00A1 in UTF16BE = i</pre>

## ^FL – Font Linking

The ^FL command provides the ability to link any TrueType font, including private character fonts, to associated fonts.

If the base font does not have a glyph for the required character, the printer looks to the linked fonts for the glyph. The font links are user-definable. The font linking remains until the link is broken or the printer is turned off. To permanently save the font linking, use the ^JUS command.

**Note** • For assistance in setting up the font links, use the font wizard in ZebraNet Bridge.

**Format:** ^FL<ext>,<base>,<link>

Parameters	Details
<ext>	<p>This is the fully-qualified filename of the extension. This file name does not accept wildcards.</p> <p>The supported extensions for this parameter are: <b>.TTF</b> and <b>.TTE</b>. The format for this parameter is the memory device followed by the font name with the extension, as follows:</p> <p style="text-align: center;"><b>E:SWISS721.TTF</b></p>
<base>	<p>This is the filename of the base font(s). The base font can be any of the following types:</p> <ul style="list-style-type: none"> <li><b>.FNT</b></li> <li><b>.TTF</b> <b>or</b></li> <li><b>.TTE</b></li> </ul> <p>From these font types you can only link to a <b>.TTF</b> or <b>.TTE</b>.</p> <p>The name of the base font can be expressed as a wild card; doing so will define multiple base fonts. The result will be that all base font files so defined will be linked to the file defined in the &lt;ext&gt; parameter.</p> <p>The filename does not have to match a file that is currently defined on the printer. A specification of <b>*.TTF</b> results in all <b>*.TTF</b> font files loaded on the printer currently or in the future to be linked with the specified &lt;ext&gt; font extension.</p>
<link>	<p>This is an indicator that determines if the extension is to be linked with the base, or unlinked from the base, as follows:</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>0</b> = &lt;ext&gt; is to be unlinked (disassociated) from the file(s) specified in &lt;base&gt;</li> <li><b>1</b> = &lt;ext&gt; is to be linked (associated) with the file(s) specified by &lt;base&gt;</li> </ul> <p><b>Default:</b> must be an accepted value or it is ignored</p>

**Comments** A font can have up to five fonts linked to it. The printer resident font, **0.FNT** is always the last font in the list of font links, but is not included in the five link maximum. It can also be placed anywhere in the font links list.

The default glyph prints when a glyph cannot be found in any of the fonts in the link list. The advanced layout command **^PA** determines if the default glyph is a space character or the default glyph of the base font, which is typically a hollow box.

The list of font links can be printed by using the **^LF** command or retrieved with the **^HT** command.

**Examples:** These examples show the code and output for no font linking and for font linking:

### No Font Linking

In the no font linking example, the Swiss721 font does not have the Asian glyphs, which is why Asian glyphs do not print.

ZPL II CODE	GENERATED LABEL
<pre> ^XA^LL1200^CW1,E:SWISS721.TTF^CW2,E:ANMDJ.TTF^CI28^FS ^FO100,100^A0,50,50^FDNO FONT LINKING^FS ^FO100,300^A1,50,50^FDTEST WITH SWISS721^FS ^FO100,400^A1,50,50^FDDRAGONFLY 蜻蜓^FS ^FO100,600^A2,50,50^FDTEST WITH ANMDJ^FS ^FO100,700^A2,50,50^FDDRAGONFLY 蜻蜓^FS ^XZ </pre>	<p><b>NO FONT LINKING</b></p> <p>TEST WITH SWISS721</p> <p>DRAGONFLY</p> <p>TEST WITH ANMDJ</p> <p>DRAGONFLY 蜻蜓</p>

### Font Linking

In the font linking example, this code is sent down to link the **ANMDJ.TTF** font to **SWISS721.TTF** font:

```

^XA
^FLE:ANMDJ.TTF,E:SWISS721.TTF,1^FS
^XZ

```

When the label reprints, the Asian characters are printed using the **ANMDJ.TTF** font, rather than the **SWISS721.TTF** font.

ZPL II CODE	GENERATED LABEL
<pre>^XA^LL1200^CW1,E:SWISS721.TTF^CW2,E:ANMDJ.TTF^CI28^FS ^FO100,100^A0,50,50^FD FONT LINKING^FS ^FO100,300^A1,50,50^FD TEST WITH SWISS721^FS ^FO100,400^A1,50,50^FD DRAGONFLY 蜻蜓^FS ^FO100,600^A2,50,50^FD TEST WITH ANMDJ^FS ^FO100,700^A2,50,50^FD DRAGONFLY 蜻蜓^FS ^XZ</pre>	<p><b>FONT LINKING</b></p> <p>TEST WITH SWISS721</p> <p>DRAGONFLY 蜻蜓</p> <p>TEST WITH ANMDJ</p> <p>DRAGONFLY 蜻蜓</p>

## ^FM – Multiple Field Origin Locations

The ^FM command allows you to control the placement of bar code symbols.

It designates field locations for the PDF417 (^B7) and MicroPDF417 (^BF) bar codes when the structured append capabilities are used. This allows printing multiple bar codes from the same set of text information.

The structured append capability is a way of extending the text printing capacity of both bar codes. If a string extends beyond what the data limitations of the bar code are, it can be printed as a series: 1 of 3, 2 of 3, 3 of 3. Scanners read the information and reconcile it into the original, unsegmented text.

The ^FM command triggers multiple bar code printing on the same label with ^B7 and ^BF only. When used with any other commands, it is ignored.

**Format:** ^FMx1,y1,x2,y2,...

Parameters	Details
x1 = x-axis location of first symbol (in dots)	<b>Values:</b> 0 to 32000 e = exclude this bar code from printing <b>Default:</b> a value must be specified
y1 = y-axis location of first symbol (in dots)	<b>Values:</b> 0 to 32000 e = exclude this bar code from printing <b>Default:</b> a value must be specified
x2 = x-axis location of second symbol (in dots)	<b>Values:</b> 0 to 32000 e = exclude this bar code from printing <b>Default:</b> a value must be specified
y2 = y-axis location of second symbol (in dots)	<b>Values:</b> 0 to 32000 e = exclude this bar code from printing <b>Default:</b> a value must be specified
... = continuation of X,Y pairs	<i>Maximum number of pairs: 60</i>

→ **Example:** This example shows you how to generate three bar codes with the text "Zebra Technologies Corporation strives to be..." would need to be repeated seven times, which includes 2870 characters of data (including spaces) between ^FD and ^FS:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FM100,100,100,600,100,1200 ^BY2,3 ^B7N,5,5,9,83,N ^FDZebra Technologies Corporation strives to be the expert supplier of innovative solutions to specialty demand labeling and ticketing problems of business and government. We will attract and retain the best people who will understand our customer's needs and provide them with systems, hardware, software, consumables and service offering the best value, high quality, and reliable performance, all delivered in a timely manner ... ^FS^XZ</pre>	
	
	

1

- 
- 1 The ellipse is not part of the code. It indicates that the text needs to be repeated seven times, as mentioned in the example description.
-

→ **Example:** This example assumes a maximum of three bar codes, with bar code 2 of 3 omitted:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FM100,100,e,e,100,1200 ^BY2,3 ^B7N,5,5,9,83,N ^FDZebra Technologies Corporation strives to be the expert supplier of innovative solutions to specialty demand labeling and ticketing problems of business and government. We will attract and retain the best people who will understand our customer's needs and provide them with systems, hardware, software, consumables and service offering the best value, high quality, and reliable performance, all delivered in a timely manner ... ^FS^XZ</pre>	 

**1** The ellipse is not part of the code. It indicates that the text needs to be repeated seven times, as mentioned in the example description.

**Comments** Subsequent bar codes print once the data limitations of the previous bar code have been exceeded. For example, bar code 2 of 3 prints once 1 of 3 has reached the maximum amount of data it can hold. Specifying three fields does not ensure that three bar codes print; enough field data to fill three bar code fields has to be provided.

The number of the **x,y** pairs can exceed the number of bar codes generated. However, if too few are designated, no symbols print.

## ^FN – Field Number

The ^FN command numbers the data fields. This command is used in both ^DF (Store Format) and ^XF (Recall Format) commands.

In a stored format, use the ^FN command where you would normally use the ^FD (Field Data) command. In recalling the stored format, use ^FN in conjunction with the ^FD command.

The optional "a" parameter can be used with the KDU Plus to cause prompts to be displayed on the KDU unit. Also, when the Print on Label link is selected on the Directory page of ZebraLink enabled printers the field prompt displays.

The number of fields and data that can be stored is dependent in the available printer memory.

**Note** • The maximum number of ^FN commands that can be used depends on the amount of data that is placed in the fields on the label. It is recommended to use 400 or fewer fields.

**Format:** ^FN#"a"

Parameters	Details
# = number to be assigned to the field	<b>Values:</b> 0 to 9999 <b>Default:</b> 0
"a" = optional parameter*	<b>Values:</b> 255 alphanumeric characters maximum (a-z,A-Z,1-9 and space) <b>Default:</b> optional parameter

\* This parameter is only available on printers with firmware V50.13.2, V53.15.5Z, V60.13.0.1, or later. For a complete example of the ^DF and ^XF command, see [^DF and ^XF – Download format and recall format on page 51](#).

### Comments

- The same ^FN value can be stored with several different fields.
- If a label format contains a field with ^FN and ^FD, the data in that field prints for any other field containing the same ^FN value.
- For the "a" parameter to function as a prompt the characters used in the "a" parameter must be surrounded by double quotes (see example).

**Example:** The ^FN1"Name" would result in "Name" being used as the prompt on the KDU unit.

## ^FO – Field Origin

The ^FO command sets a field origin, relative to the label home (^LH) position. ^FO sets the upper-left corner of the field area by defining points along the x-axis and y-axis independent of the rotation.

**Format:** ^FOx,y,z

Parameters	Details
x = x-axis location (in dots)	<b>Values:</b> 0 to 32000 <b>Default:</b> 0
y = y-axis location (in dots)	<b>Values:</b> 0 to 32000 <b>Default:</b> 0
<b>z = justification</b>  .14↑  The z parameter is only supported in firmware versions V60.14.x, V50.14.x, or later.	<b>Values:</b> 0 = left justification 1 = right justification 2 = auto justification (script dependent) <b>Default:</b> last accepted ^FW value or ^FW default

**Comments** If the value entered for the x or y parameter is too high, it could position the field origin completely off the label.

.14↑

This command interacts with the field direction parameter of ^FP and with the rotation parameter of ^A. For output and examples, see [Field Interactions on page 1341](#).

The auto justification option might cause unexpected results if variable fields or bidirectional text are used with ^FO. For the best results with bidirectional text and/or variable fields, use either the left or right justification option.

## ^FP – Field Parameter

The ^FP command allows vertical and reverse formatting of the font field, commonly used for printing Asian fonts.

**Format:** ^FPd,g

Parameters	Details
d = direction	<b>Values:</b> H = horizontal printing (left to right) V = vertical printing (top to bottom) R = reverse printing (right to left) <b>Default:</b> H
g = additional inter-character gap (in dots)	<b>Values:</b> 0 to 9999 <b>Default:</b> 0 if no value is entered

**Example:** This is an example of how to implement reverse and vertical print:

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^FO100,50 ^FPV,10 ^AV ^FDvertical^FS ^XZ </pre>	
<pre> ^XA ^FO350,50 ^FPR,10 ^AV ^FDreverse^FS ^XZ </pre>	

.141

For vertical and reverse printing directions, combining semantic clusters are used to place characters.

This command interacts with the justification parameters of ^FO and ^FT and with the rotation parameter of ^A. For output and examples, see [Field Interactions on page 1341](#).

## ^FR - Field Reverse Print

The ^FR command allows a field to appear as white over black or black over white. When printing a field and the ^FR command has been used, the color of the output is the reverse of its background.

**Format:** ^FR

- **Example:** In this example, the ^GB command creates areas of black allowing the printing to appear white:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^PR1 ^FO100,100 ^GB70,70,70,,,3^FS ^FO200,100 ^GB70,70,70,,,3^FS ^FO300,100 ^GB70,70,70,,,3^FS ^FO400,100 ^GB70,70,70,,,3^FS ^FO107,110^CF0,70,93 ^FR^FDREVERSE^FS ^XZ</pre>	

**Comments** The ^FR command applies to only one field and has to be specified each time. When multiple ^FR commands are going to be used, it might be more convenient to use the ^LR command.

## ^FS – Field Separator

The ^FS command denotes the end of the field definition. Alternatively, ^FS command can also be issued as a single ASCII control code SI (Control-O, hexadecimal 0F).

**Format:** ^FS

## ^FT - Field Typeset

The ^FT command sets the field position, relative to the home position of the label designated by the ^LH command. The typesetting origin of the field is fixed with respect to the contents of the field and does not change with rotation.

**Note** • The ^FT command is capable of concatenation of fields.

**Format:** ^FTx,y,z

Parameters	Details
x = x-axis location (in dots)	<b>Values:</b> 0 to 32000 <b>Default:</b> position after last formatted text field
y = y-axis location (in dots)	<b>Values:</b> 0 to 32000 <b>Default:</b> position after last formatted text field
z = justification	<b>Values:</b> 0 = left justification 1 = right justification 2 = auto justification (script dependent) <b>Default:</b> last accepted ^FW value or ^FW default  The z parameter is only supported in firmware version V60.14.x, V50.14.x, or later.

**Table 13 • Typeset Justification**

<b>Left Justified</b>	Text	For examples, see <a href="#">Field Interactions on page 1341</a> .
	Bar Codes	Origin is base of bar code, at left edge
	Graphic Boxes	Origin is bottom-left corner of the box
	Images	Origin is bottom-left corner of the image area
<b>Right Justified</b>	Text	For examples, see <a href="#">Field Interactions on page 1341</a> .
	Bar Codes	Origin is base of bar code, at right edge
	Graphic Boxes	Origin is bottom-right corner of the box
	Images	Origin is bottom-right corner of the image area

**Example:** This is an example of the ^FT command and concatenation:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FT10,200^A0N,30,20^FDACME ^FS ^FT^GS^FDC^FS ^FT^A0N,30,20^FDSummer ^FS ^FT^A0N,60,50^FDClearance ^FS ^FT^A0N,120,100^FDSale ^FS ^XZ</pre>	<p>ACME™ Summer Clearance Sale</p>

When a coordinate is missing, the position following the last formatted field is assumed. This *remembering* simplifies field positioning with respect to other fields. Once the first field is positioned, other fields follow automatically.

There are several instances where using the ^FT command without specifying x and y parameters is not recommended:

- when positioning the first field in a label format
- at any time with the ^FN (Field Number) command
- following an ^SN (Serialization Data) command
- variable data
- bidirectional text

.14↑

The right typeset justified is available only for printers with firmware version V60.14.x, V50.14.x, or later.

This command interacts with the field direction parameters of ^FP and with the rotation parameter of ^A. For output and code examples, see [Field Interactions on page 1341](#)

## ^FV – Field Variable

**^FV** replaces the **^FD** (field data) command in a label format when the field is variable.

**Format:** ^FVa

Parameters	Details
a = variable field data to be printed	<b>Values:</b> 0 to 3072 byte string <b>Default:</b> if no data is entered, the command is ignored

**Example:** This is an example of how to use the **^MC** and **^FV** command:

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^FO40,40 ^GB300,203,8^FS ^FO55,60^CF0,25 ^FVVARIABLE DATA #1^FS ^FO80,150 ^FDFIXED DATA^FS ^MCN ^XZ </pre>	<p><b>GENERATED LABEL</b></p>
<pre> ^XA ^FO55,60^CF0,25 ^FVVARIABLE DATA #2^FS ^MCY ^XZ </pre>	

**Comments** ^FV fields are always cleared after the label is printed. ^FD fields are not cleared.

## ^FW – Field Orientation

The ^FW command sets the default orientation for all command fields that have an orientation (rotation) parameter (and in x.14 sets the default justification for all commands with a justification parameter). Fields can be rotated 0, 90, 180, or 270 degrees clockwise by using this command. In x.14, justification can be left, right, or auto.

The ^FW command affects only fields that follow it. Once you have issued a ^FW command, the setting is retained until you turn off the printer or send a new ^FW command to the printer.

**Format:** ^FWr,z

Parameters	Details
r = rotate field	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>N = normal</li> <li>R = rotated 90 degrees</li> <li>I = inverted 180 degrees</li> <li>B = bottom-up 270 degrees, read from bottom up</li> </ul> <p><b>Initial Value at Power Up:</b> N</p>
<p><b>z = justification</b></p> <p><small>.14↑</small></p> <p>The z parameter is available only with printers with firmware version V60.14.x, V50.14.x, or later.</p>	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>0 = left justification</li> <li>1 = right justification</li> <li>2 = auto justification (script dependent)</li> </ul> <p><b>Default:</b> auto for ^TB and left for all other commands</p>

**Example:** This example shows how ^FW rotation works in conjunction with ^FO. In this example, note that:

- the fields using A0N print the field in normal rotation
- the fields with no rotation indicated (A0) follow the rotation used in the ^FW command (^FWR).

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^FWR ^FO150,90^A0N,25,20^FDZebra Technologies^FS ^FO115,75^A0,25,20^FD0123456789^FS ^FO150,115^A0N,25,20^FD333 Corporate Woods Parkway^FS ^FO400,75^A0,25,20^FDXXXXXXXXXX^FS ^XZ </pre>	<p>0123456789</p> <p>Zebra Technologies 333 Corporate Woods Parkway</p> 

**Comments** ^FW affects only the orientation in commands where the rotation parameter has not been specifically set. If a command has a specific rotation parameter, that value is used.

^FW affects only the justification in commands where the parameter has not been set. If a command has a specific justification parameter that value is used .

.14↑

## ^FX – Comment

The ^FX command is useful when you want to add *non-printing* informational comments or statements within a label format. Any data after the ^FX command up to the next caret (^) or tilde (~) command does not have any effect on the label format. Therefore, you should avoid using the caret (^) or tilde (~) commands within the ^FX statement.

**Format:** ^FXc

Parameters	Details
c = non printing comment	Creates a non-printable comment.

**Example:** This is an example of how to use the ^FX command effectively:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^LH100,100^FS ^FXSHIPPING LABEL^FS ^FO10,10^GB470,280,4^FS ^FO10,190^GB470,4,4^FS ^FO10,80^GB240,2,2^FS ^FO250,10^GB2,100,2^FS ^FO250,110^GB226,2,2^FS ^FO250,60^GB226,2,2^FS ^FO156,190^GB2,95,2^FS ^FO312,190^GB2,95,2^FS ^XZ</pre>	

**Comments** Correct usage of the ^FX command includes following it with the ^FS command.

## ^GB – Graphic Box

The ^GB command is used to draw boxes and lines as part of a label format. Boxes and lines are used to highlight important information, divide labels into distinct areas, or to improve the appearance of a label. The same format command is used for drawing either boxes or lines.

**Format:** ^GBw,h,t,c,r

Parameters	Details
w = box width (in dots)	<b>Values:</b> value of t to 32000 <b>Default:</b> value used for thickness (t) or 1
h = box height (in dots)	<b>Values:</b> value of t to 32000 <b>Default:</b> value used for thickness (t) or 1
t = border thickness (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> 1
c = line color	<b>Values:</b> B = black W = white <b>Default:</b> B
r = degree of corner-rounding	<b>Values:</b> 0 (no rounding) to 8 (heaviest rounding) <b>Default:</b> 0

For the w and h parameters, keep in mind that printers have a default of 6, 8, 12, or 24 dots/millimeter. This comes out to 153, 203, 300, or 600 dots per inch. To determine the values for w and h, calculate the dimensions in millimeters and multiply by 6, 8, 12, or 24.

If the width and height are not specified, you get a solid box with its width and height as specified by value t.

The roundness-index is used to determine a rounding-radius for each box. Formula:

$$\text{rounding-radius} = (\text{rounding-index} / 8) * (\text{shorter side} / 2)$$

where the shorter side is the lesser of the width and height (after adjusting for minimum and default values).

→ **Examples:** Here are a few examples of graphic boxes:  
**Width: 1.5 inch; Height: 1 inch; Thickness: 10; Color: default; Rounding: default**

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO50,50 ^GB300,200,10^FS ^XZ</pre>	

**Width: 0 inch; Height: 1 inch; Thickness: 20; Color: default; Rounding: default:**

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO50,50 ^GB0,203,20^FS ^XZ</pre>	

**Width: 1 inch; Height: 0 inch; Thickness: 30; Color: default; Rounding: default**

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO50,50 ^GB203,0,20^FS ^XZ</pre>	

**Width: 1.5 inch; Height: 1 inch; Thickness: 10; Color: default; Rounding: 5**

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO50,50 ^GB300,200,10,,5^FS ^XZ</pre>	

## ^GC – Graphic Circle

The ^GC command produces a circle on the printed label. The command parameters specify the diameter (width) of the circle, outline thickness, and color. Thickness extends inward from the outline.

**Format:** ^GCd,t,c

Parameters	Details
d = circle diameter (in dots)	<b>Values:</b> 3 to 4095 (larger values are replaced with 4095) <b>Default:</b> 3
t = border thickness (in dots)	<b>Values:</b> 2 to 4095 <b>Default:</b> 1
c = line color	<b>Values:</b> B = black W = white <b>Default:</b> B

**Example:** This is an example of how to create a circle on the printed label:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO50,50 ^GC250,10,B^FS ^XZ</pre>	

## ^GD – Graphic Diagonal Line

The ^GD command produces a straight diagonal line on a label. This can be used in conjunction with other graphic commands to create a more complex figure.

**Format:** ^GDw,h,t,c,o

Parameters	Details
w = box width (in dots)	<b>Values:</b> 3 to 32000 <b>Default:</b> value of t (thickness) or 3
h = box height (in dots)	<b>Values:</b> 3 to 32000 <b>Default:</b> value of t (thickness) or 3
t = border thickness (in dots)	<b>Values:</b> 1 to 32000 <b>Default:</b> 1
c = line color	<b>Values:</b> B = black W = white <b>Default:</b> B
o = orientation (direction of the diagonal)	<b>Values:</b> R (or /) = right-leaning diagonal L (or \) = left-leaning diagonal <b>Default:</b> R

**Example:** This is an example of how to create a diagonal line connecting one corner with the opposite corner of a box on a printed label:

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^FO150,100 ^GB350,203,10^FS ^FO155,110 ^GD330,183,10,,R^FS ^XZ </pre>	

## ^GE – Graphic Ellipse

The ^GE command produces an ellipse in the label format.

**Format:** ^GEw,h,t,c

Parameters	Details
w = ellipse width (in dots)	<b>Values:</b> 3 to 4095 (larger values are replaced with 4095) <b>Default:</b> value used for thickness (t) or 1
h = ellipse height (in dots)	<b>Values:</b> 3 to 4095 <b>Default:</b> value used for thickness (t) or 1
t = border thickness (in dots)	<b>Values:</b> 2 to 4095 <b>Default:</b> 1
c = line color	<b>Values:</b> B = black W = white <b>Default:</b> B

**Example:** This is an example of how to create a ellipse on a printed label:

ZPL II CODE	GENERATED LABEL
<pre>^XA ^FO100,100 ^GE300,100,10,B^FS ^XZ</pre>	

## ^GF – Graphic Field

The ^GF command allows you to download graphic field data directly into the printer's bitmap storage area. This command follows the conventions for any other field, meaning a field orientation is included. The graphic field data can be placed at any location within the bitmap space.

**Format:** ^GFa,b,c,d,data

Parameters	Details
a = compression type	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>A = ASCII hexadecimal (follows the format for other download commands)</li> <li>B = binary (data sent after the c parameter is strictly binary)</li> <li>C = compressed binary (data sent after the c parameter is in compressed binary format. The data is compressed on the host side using Zebra's compression algorithm. The data is then decompressed and placed directly into the bitmap.)</li> </ul> <p><b>Default:</b> A</p>
b = binary byte count	<p><b>Values:</b> 1 to 99999</p> <p>This is the total number of bytes to be transmitted for the total image or the total number of bytes that follow parameter d. For ASCII download, the parameter should match parameter c. Out-of-range values are set to the nearest limit.</p> <p><b>Default:</b> command is ignored if a value is not specified</p>
c = graphic field count	<p><b>Values:</b> 1 to 99999</p> <p>This is the total number of bytes comprising the graphic format (width x height), which is sent as parameter d. Count divided by bytes per row gives the number of lines in the image. This number represents the size of the image, not necessarily the size of the data stream (see d).</p> <p><b>Default:</b> command is ignored if a value is not specified</p>
d = bytes per row	<p><b>Values:</b> 1 to 99999</p> <p>This is the number of bytes in the downloaded data that comprise one row of the image.</p> <p><b>Default:</b> command is ignored if a value is not specified</p>
data = data	<p><b>Values:</b></p> <p><b>ASCII hexadecimal data: 00 to FF</b></p> <p>A string of ASCII hexadecimal numbers, two digits per image byte. CR and LF can be inserted as needed for readability. The number of two-digit number pairs must match the above count. Any numbers sent after count is satisfied are ignored. A comma in the data pads the current line with 00 (white space), minimizing the data sent. ~DN or any caret or tilde character prematurely aborts the download.</p> <p><b>Binary data:</b> Strictly binary data is sent from the host. All control prefixes are ignored until the total number of bytes needed for the graphic format is sent.</p>

- **Example:** This example downloads 8,000 total bytes of data and places the graphic data at location 100,100 of the bitmap. The data sent to the printer is in ASCII form.

**^F0100,100^GFA,8000,8000,80,ASCII data**

- **Example:** This example downloads 8,000 total bytes of data and places the graphic data at location 100,100 of the bitmap. The data sent to the printer is in binary form.

**^F0100,100^GFB,8000,8000,80,Binary data**

## ^GS – Graphic Symbol

The ^GS command enables you to generate the registered trademark, copyright symbol, and other symbols.

**Format:** ^GSo,h,w

Parameters	Details
<b>o</b> = field orientation	<b>Values:</b> N = normal R = rotate 90 degrees clockwise I = inverted 180 degrees B = bottom-up, 270 degrees <b>Default:</b> N or last ^FW value
<b>h</b> = character height proportional to width (in dots)	<b>Values:</b> 0 to 32000 <b>Default:</b> last ^CF value
<b>w</b> = character width proportional to height (in dots)	<b>Values:</b> 0 to 32000 <b>Default:</b> last ^CF value

→ **Example:** Use the ^GS command followed by ^FD and the appropriate character (A through E) within the field data to generate the desired character:

ZPL II CODE	GENERATED LABEL
<pre>^XA^CFD ^FO50,50 ^FDZEBRA PROGRAMMING^FS ^FO50,75 ^FDLANGUAGE II (ZPL II )^FS ^FO280,75 ^GS^FDC^FS ^XZ</pre>	

A = ® (Registered Trade Mark)

B = © (Copyright)

C = ™ (Trade Mark)

D = UL (Underwriters Laboratories approval)

E = CSA (Canadian Standards Association approval)

## ~HB – Battery Status

When the ~HB command is sent to the printer, a data string is sent back to the host. The string starts with an <STX> control code sequence and terminates by an <ETX><CR><LF> control code sequence.

**Important** • This command only responds to mobile printers.

**Format:** ~HB

**Parameters:** when the printer receives the command, it returns:

<STX>bb.bb, hh.hh, bt<ETX><CR><LF>

<STX>	=	ASCII start-of-text character
bb.bb	=	current battery voltage reading to the nearest 1/4 volt
hh.hh	=	current head voltage reading to the nearest 1/4 volt
bt	=	battery temperature in Celsius
<ETX>	=	ASCII end-of-text character
<CR>	=	ASCII carriage return
<LF>	=	ASCII line feed character

**Comments** This command is used for the power-supply battery of the printer and should not be confused with the battery backed-up RAM.

## ~HD – Head Diagnostic

The ~HD command echoes printer status information that includes the power supply and head temperature using the terminal emulator.

**Format:** ~HD

→ **Example:** This is an example of the ~HD command:

```
Head Temp = 29
Ambient Temp = 00
Head Test = Passed
Darkness Adjust = 23
Print Speed = 2
Slew Speed = 6
Backfeed Speed = 2
Static_pitch_length = 0521
Dynamic_pitch_length = 0540
Max_dynamic_pitch_length = 0540
Min_dynamic_pitch_length = 0537
COMMAND_PFX = ~ : FORMAT_PFX = ^ : DELIMITER = ,
P30 INTERFACE = None
P31 INTERFACE = None
P32 INTERFACE = Front Panel           Revision 5
P33 INTERFACE = None
P34 INTERFACE = None
P35 INTERFACE = None
Dynamic_top_position = 0008
No ribbon A/D = 0000
```

## ^HF – Host Format

The ^HF command sends stored formats to the host.

**Format:** ^HFd,o,x

Parameters	Details
d = device to recall image	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
o = image name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension	<b>Fixed Value:</b> .ZPL

**Example:** This example shows the sequence and results.

Using a terminal emulator, you download this code to the printer:

```
^XA  
^DFB:FILE1.ZPL  
^FO100,100^A0,100  
^FDTEST^FS  
^XZ
```

Then you send this code to the printer:

```
^XA  
^HFB:FILE1.ZPL  
^XZ
```

The terminal emulator returns this code:

```
^XA^DFFILE1,  
^FO100,100^A0,100^FDTEST^FS  
^XZ
```

## ^HG – Host Graphic

The ^HG command is used to upload graphics to the host. The graphic image can be stored for future use, or it can be downloaded to any Zebra printer.

**Format:** ^HGd:o.x

Parameters	Details
d = device location of object	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> search priority
o = object name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension	<b>Fixed Value:</b> .GRF

**Comments** For more information on uploading graphics, see [^HY on page 235](#).

## ^HH – Configuration Label Return

The ^HH command echoes printer configuration back to the host, using a terminal emulator.

**Format:** ^HH

→ **Example:** This is an example of what is returned to the host when ^XA^HH^XZ is sent to the printer:

+10	DARKNESS
+000	TEAR OFF
TEAR OFF	PRINT MODE
NON-CONTINUOUS	MEDIA TYPE
WEB	SENSOR TYPE
DIRECT-THERMAL	PRINT METHOD
050 6/8 MM	PRINT WIDTH
0622	LABEL LENGTH
22.0IN 557MM	MAXIMUM LENGTH
9600	BAUD
8 BITS	DATA BITS
NONE	PARITY
XON/XOFF	HOST HANDSHAKE
NONE	PROTOCOL
000	NETWORK ID
NORMAL MODE	COMMUNICATIONS
<~> ?EH	CONTROL PREFIX
<~> 5EH	FORMAT PREFIX
<,> 2CH	DELIMITER CHAR
ZPL II	ZPL MODE
NO MOTION	MEDIA POWER UP
NO MOTION	HEAD CLOSE
DEFAULT	BACKFEED
+000	LABEL TOP
+0000	LEFT POSITION
026	WEB S.

255.255.255.000	SUBNET MASK
010.003.005.001	DEFAULT GATEWAY

## ~HI – Host Identification

The **~HI** command is designed to be sent from the host to the Zebra printer to retrieve information. Upon receipt, the printer responds with information on the model, software version, dots-per-millimeter setting, memory size, and any detected options.

**Format:** ~HI

When the printer receives this command, it returns:

**XXXXXX,V1.0.0,dpm,000KB,X**

**XXXXXX = model of Zebra printer**

**V1.0.0 = version of software**

**dpm = dots/mm**

6, 8, 12, or 24 dots/mm printheads

**000KB = memory**

**512KB = 1/2 MB**

**1024KB = 1 MB**

**2048KB = 2 MB**

**4096KB = 4 MB**

**8192KB = 8 MB**

**x = recognizable options**

only options specific to printer are shown (cutter, options, et cetera.)

## ~HM – Host RAM Status

Sending ~HM to the printer immediately returns a memory status message to the host. Use this command whenever you need to know the printer's RAM status.

When ~HM is sent to the Zebra printer, a line of data containing information on the total amount, maximum amount, and available amount of memory is sent back to the host.

**Format:** ~HM

**Example:** This example shows when the ~HM is sent to the printer, a line of data containing three numbers are sent back to the host. Each set of numbers is identified and explained in the table that follows:

1	The total amount of RAM (in kilobytes) installed in the printer. In this example, the printer has 1024K RAM installed.
2	The maximum amount of RAM (in kilobytes) available to the user. In this example, the printer has a maximum of 780K RAM available.
3	The amount of RAM (in kilobytes) currently available to the user. In this example, there is 780K of RAM in the printer currently available to the user.

**Comments** Memory taken up by bitmaps is included in the currently available memory value (due to ^MCN).

Downloading a graphic image, fonts, or saving a bitmap affects only the amount of RAM. The total amount of RAM and maximum amount of RAM does not change after the printer is turned on.

## ~HQ – Host Query

The ~HQ command group causes the printer to send information back to the host.

### Supported Devices

- Xi4, RXi4
- ZM400/ZM600 with v53.17.1Z or later, RZ400/RZ600
- S4M with v53.17.1Z or later
- G-Series with v56.16.5 or later  
or  
G-Series with v61.16.5 or later

Format: ~HQquery-type

Parameter	Details
query-type	<p>For detailed examples of these parameters, see <a href="#">~HQ Examples on page 222</a>.</p> <p><b>Values:</b></p> <p><b>ES</b> = requests the printer's status - see <a href="#">Table 14 on page 221</a> and <a href="#">Table 15 on page 221</a></p> <p><b>HA</b> = hardware address of the internal wired print server</p> <p><b>JT</b> = requests a summary of the printer's printhead test results</p> <p><b>MA</b> = maintenance alert settings</p> <p><b>MI</b> = maintenance information</p> <p><b>OD</b> = odometer</p> <p><b>PH</b> = printhead life history</p> <p><b>PP</b> = printer's Plug and Play string</p> <p><b>SN</b> = printer's serial number</p> <p><b>UI</b> = USB product ID and BDC release version</p> <p><b>Default:</b> must be an accepted value or the command is ignored</p>

**Comments** The response to the ~HQ command starts with STX, a CR LF is inserted between each line, and the response ends with ETX.

Table 14 • Error Flags (~HQES)

Error Flags	Flag	Group 2	Group 1 (X = Value can be any hexadecimal number [0-9, A-F])							
		Nibbles16-9	Nibble 8	Nibble 7	Nibble 6	Nibble 5	Nibble 4	Nibble 3	Nibble 2	Nibble 1
No Error	0	00000000	0	0	0	0	0	0	0	0
Error Present	1	00000000	X	X	X	X	X	X	X	X
Printhead Thermistor Open	1	00000000	X	X	X	X	X	2	X	X
Invalid Firmware Config.	1	00000000	X	X	X	X	X	1	X	X
Printhead Detection Error	1	00000000	X	X	X	X	X	X	8	X
Bad Printhead Element	1	00000000	X	X	X	X	X	X	4	X

Sensor 7 (in retract) <sup>h</sup>	1 <sup>h</sup>	00000000	X	X	X	X	X	4 <sup>h</sup>	X	X
Sensor 8 (at bin) <sup>h</sup>	1 <sup>h</sup>	00000000	X	X	X	X	X	8 <sup>h</sup>	X	X

**h.** This error flag is supported only on KR403 printers.

## ~HQ Examples

This section provides detail examples of all the available parameters.

**Example 1:** This example shows how to request the printer's status.

- a. To request the printer's status, type ~HQES

The printer responds with data similar to this:

PRINTER STATUS

ERRORS: 1 00000000 00000005

WARNINGS: 1 00000000 00000002

In this example, the Printer Status resolves to these conditions:

- The cover/printhead is open (value = 4).
- Media is out or not loaded into the printer (value = 1).
- The printhead needs to be cleaned (value = 2).
- Error nibble 1 is equal to 5 when the error status values are added together (4 + 1).

This illustration identifies the printer status definitions:

1	Flag
2	Nibble 16-9
3	Nibble 8-4
4	Nibble 3
5	Nibble 2
6	Nibble 1

→ **Example 2:** This example shows how the printer responds when the printer receives the ~HQES command:

- a. To see how the printer responds, type ~HQES

The printer responds with data similar to this:

PRINTER STATUS

ERRORS: 1 00000000 0000000B

WARNINGS: 0 00000000 00000000

In this example, the printer status resolves to the following conditions:

- The cutter has a fault (value = 8).
- Ribbon is out or not loaded into the printer (value = 2).
- Media is out or not loaded into the printer (value = 1).
- Error byte 1 is equal to B when the error status values are added together (8 + 2 + 1 = hexadecimal B).

→ **Example 3:** This is an example of how to retrieve the hardware address of the internal wired print server.

- a. To get the hardware address of the internal wired print server, type ~HQHA

The printer responds with data similar to this:

MAC ADDRESS

00:07:4d:2c:e0:7a

→ **Example 4:** This is an example of how to request a summary of the printer's printhead test results.

The ^JT command is used to initiate printhead testing, set the testing interval, and set the element range to be tested. For more details see, [^JT on page 269](#).

- a. To request a summary of the printer's printhead test, type ~HQJT

The printer responds with data similar to this:

PRINT HEAD TEST RESULTS

0,A,0000,0000,0000

When the printer has printed enough labels to trigger a printhead test, the initial data changes.

- b. To request a summary of the printer's printhead test, type ~HQJT

The printer responds with data similar to this:

PRINT HEAD TEST RESULTS:

0,A,0015,0367,0000

This illustration identifies the printhead test field definitions:

1	Element failure
2	Manual (M) or automatic (A) range
3	First test element
4	Last test element
5	Failure count

→ **Example 5:** This is an example of how to use the maintenance alert query for the ~HQ command.

- To get the current settings, type ~HQMA

The printer responds with data similar to this:

```
~HQMA
MAINTENANCE ALERT SETTINGS
HEAD REPLACEMENT INTERVAL: 1 km
HEAD REPLACEMENT FREQUENCY: 0 M
HEAD CLEANING INTERVAL: 0 M
HEAD CLEANING FREQUENCY: 0 M
PRINT REPLACEMENT ALERT: NO
PRINT CLEANING ALERT: NO
UNITS: C
```

→ **Example 6:** This is an example of how to use the maintenance information query for the ~HQ command. Note that the message is controlled by the ^MI command.

- To get the current settings, type ~HQMI

The printer responds with data similar to this:

```
MAINTENANCE ALERT MESSAGES
CLEAN: PLEASE CLEAN PRINT HEAD
REPLACE: PLEASE REPLACE PRINT HEAD
```

→ **Example 7:** This is an example of how to use the odometer query for the ~HQ command. Note that the units of measure are controlled by the ^MA command. Also, if the "Early Warning Maintenance State" is turned "ON" the printer response would also list LAST CLEANED and CURRENT PRINthead LIFE counters.

- To get the current settings, type ~HQOD

The printer responds with data similar to this:

**PRINT METERS**

```
TOTAL NONRESETTABLE:      8560 "
USER RESETTABLE CNTR1:     9 "
USER RESETTABLE CNTR2:     8560 "
```

The units of measure are set to inches.

- To change the units of measure to centimeters, type:

**^XA^MA,,,C**

**^XZ**

The units of measure are set to centimeters.

- To check the settings, type ~HQOD

The printer responds with data similar to this:

**PRINT METERS**

```
TOTAL NONRESETTABLE:      21744 cm
USER RESETTABLE CNTR1:     24 cm
USER RESETTABLE CNTR2:     21744 cm
```

→ **Example 8:** This is an example of how to use the printhead life query for the ~HQ command. Note that the units of measure are controlled by the ^MA command.

- To get the current settings, type ~HQPH

The printer responds with data similar to this:

**LAST CLEANED: 257 "**  
**HEAD LIFE HISTORY**

**# DISTANCE**

**1: 257 "**

**2: 1489 "**

**3: 7070 "**

1

2

<b>1</b>	The current life of the print head.
<b>2</b>	Line items 2 through 10 (the example only shows 2 through 3) tracks the measurement for each time the print head is changed.

→ **Example 9:** This is an example of how to request the printer's Plug and Play string.

- a. To request the printer's Plug and Play string, type ~HQPP

The printer responds with data similar to this:

PLUG AND PLAY MESSAGES

MFG: Zebra Technologies

CMD: ZPL

MDL: GX420t

→ **Example 10:** This is an example of how to retrieve the printer's serial number.

- a. To get the printer's serial number, type ~HQSN

The printer responds with data similar to this:

SERIAL NUMBER

41A06440023

→ **Example 11:** This is an example of how to retrieve the printer's USB product ID and BCD release version.

- a. To get the printer's USB product ID and BCD release version, type ~HQUI

The printer responds with data similar to this:

USB INFORMATION

PID: 0085

RELEASE VERSION: 15.01

## ~HS – Host Status Return

When the host sends ~HS to the printer, the printer sends three data strings back. Each string starts with an <STX> control code and is terminated by an <ETX><CR><LF> control code sequence. To avoid confusion, the host prints each string on a separate line.

**Note** • When a ~HS command is sent the printer will not send a response to the host if the printer is in one of these conditions:

- MEDIA OUT
- RIBBON OUT
- HEAD OPEN
- REWINDER FULL
- HEAD OVER-TEMPERATURE

**String 1** <STX>aaa,b,c,dddd,eee,f,g,h,iii,j,k,l<ETX><CR><LF>

<b>aaa</b>	= communication (interface) settings <sup>a</sup>
<b>b</b>	= paper out flag (1 = paper out)
<b>c</b>	= pause flag (1 = pause active)
<b>dddd</b>	= label length (value in number of dots)
<b>eee</b>	= number of formats in receive buffer
<b>f</b>	= <i>buffer full</i> flag (1 = receive buffer full)
<b>g</b>	= <i>communications diagnostic mode</i> flag (1 = diagnostic mode active)
<b>h</b>	= <i>partial format</i> flag (1 = partial format in progress)
<b>iii</b>	= unused (always 000)
<b>j</b>	= <i>corrupt RAM</i> flag (1 = configuration data lost)
<b>k</b>	= temperature range (1 = under temperature)
<b>l</b>	= temperature range (1 = over temperature)

- 
- i. This string specifies the printer's baud rate, number of data bits, number of stop bits, parity setting, and type of handshaking. This value is a three-digit decimal representation of an eight-bit binary number. To evaluate this parameter, first convert the decimal number to a binary number.

The nine-digit binary number is read according to this table:

aaa = a <sup>8</sup> a <sup>7</sup> a <sup>6</sup> a <sup>5</sup> a <sup>4</sup> a <sup>3</sup> a <sup>2</sup> a <sup>1</sup> a <sup>0</sup>	
a <sup>7</sup> = Handshake 0 = Xon/Xoff 1 = DTR	a <sup>8</sup> a <sup>2</sup> a <sup>1</sup> a <sup>0</sup> = Baud  0 000 = 110 0 001 = 300 0 010 = 600 0 011 = 1200 0 100 = 2400 0 101 = 4800 0 110 = 9600 0 111 = 19200 1 000 = 28800 <i>(available only on certain printer models)</i> 1 001 = 38400 <i>(available only on certain printer models)</i> 1 010 = 57600 <i>(available only on certain printer models)</i> 1 011 = 14400
a <sup>6</sup> = Parity Odd/Even 0 = Odd 1 = Even	
a <sup>5</sup> = Disable/Enable 0 = Disable 1 = Enable	
a <sup>4</sup> = Stop Bits 0 = 2 Bits 1 = 1 Bit	
a <sup>3</sup> = Data Bits 0 = 7 Bits 1 = 8 Bits	

### String 2 <STX>mmm,n,o,p,q,r,s,t,uuuuuuuu,v,www<ETX><CR><LF>

<b>mmm</b>	= function settings <sup>j</sup>
<b>n</b>	= unused
<b>o</b>	= <i>head up</i> flag (1 = head in up position)

---

- j.** This string specifies the printer's media type, sensor profile status, and communication diagnostics status. As in String 1, this is a three-digit decimal representation of an eight-bit binary number. First, convert the decimal number to a binary number.
- k.** These values are only supported on the ZE500, Xi4, RXi4, ZM400/ZM600, and RZ400/RZ600 printers.

<b>p</b>	= <i>ribbon out flag (1 = ribbon out)</i>
<b>q</b>	= <i>thermal transfer mode flag (1 = Thermal Transfer Mode selected)</i>
<b>r</b>	= Print Mode <ul style="list-style-type: none"> <li><b>0</b> = Rewind</li> <li><b>1</b> = Peel-Off</li> <li><b>2</b> = Tear-Off</li> <li><b>3</b> = Cutter</li> <li><b>4</b> = Applicator</li> <li><b>5</b> = Delayed cut</li> <li><b>6</b> = Linerless Peel</li> <li><b>7</b> = Linerless Rewind</li> <li><b>8</b> = Partial Cutter</li> <li><b>9</b> = RFID</li> <li><b>K</b> = Kiosk</li> <li><b>S</b> = Stream</li> </ul>
<b>s</b>	= print width mode
<b>t</b>	= <i>label waiting flag (1 = label waiting in Peel-off Mode)</i>
<b>uuuuuuuu</b>	= labels remaining in batch
<b>v</b>	= <i>format while printing flag (always 1)</i>
<b>ww</b>	= number of graphic images stored in memory

- j. This string specifies the printer's media type, sensor profile status, and communication diagnostics status. As in String 1, this is a three-digit decimal representation of an eight-bit binary number. First, convert the decimal number to a binary number.  
 k. These values are only supported on the ZE500, Xi4, RXi4, ZM400/ZM600, and RZ400/RZ600 printers.

The eight-digit binary number is read according to this table:

mmmm = m7 m6 m5 m4 m3 m2 m1 m0	
m7 = Media Type 0 = Die-Cut 1 = Continuous	m4 m3 m2 m1 = Unused 0 = Off 1 = On
m6 = Sensor Profile 0 = Off	m0 = Print Mode 0 = Direct Thermal 1 = Thermal Transfer
m5 = Communications Diagnostics 0 = Off 1 = On	

### String 3 <STX>xxxx,y<ETX><CR><LF>

<b>xxxx</b>	= password
<b>y</b>	= 0 (static RAM not installed)
	1 (static RAM installed)

## ^HT – Host Linked Fonts List

.14↑

This command is available only for printers with firmware version V60.14.x, V50.14.x, or later.

The ^HT command receives the complete list of font links over a communication port.

→ **Example:** The SWISS.721.TTF is the base font, ANMDJ.TTF is the first linked font, and MSGOTHIC.TTF is the second linked font:

ZPL II CODE	DATA RETURNED
^XA ^HT ^XZ	LIST OF FONT LINKS E:SWISS721.TTF E:ANMDJ.TTF E:MSGOTHIC.TTF

This is the code that was used to establish the font links:

```
^XA
^FLE:ANMDJ.TTF,E:SWISS721.TTF,1^FS
^FLE:MSGOTHIC.TTF,E:SWISS721.TTF,1^FS
^XZ
```

## ~HU – Return ZebraNet Alert Configuration

This command returns the table of configured ZebraNet Alert settings to the host.

**Format:** ~HU

**Example:** If the ~HU command is sent to the printer with existing Alert messages set to go to e-mail and SNMP traps, the data returned would look something like the information below. See [^SX on page 348](#) for complete information on the individual parameter settings.

```
B,C,Y,Y,ADMIN@COMPANY.COM,0
J,F,Y,Y,,0
C,F,Y,Y,,0
D,F,Y,Y,,0
E,F,Y,N,,0
F,F,Y,N,,0
H,C,Y,N,ADMIN@COMPANY.COM,0
N,C,Y,Y,ADMIN@COMPANY.COM,0
O,C,Y,Y,ADMIN@COMPANY.COM,0
P,C,Y,Y,ADMIN@COMPANY.COM,0
```

**Important** • If there are no ^SX (alerts) set, the printer will not respond to the ~HU command.

The first line indicates that condition B (ribbon out) is routed to destination C (e-mail address).

The next two characters, Y and Y, indicate that the *condition set* and *condition clear* options have been set to **yes**.

The following entry is the destination that the Alert e-mail should be sent to; in this example it is **admin@company.com**.

The last figure seen in the first line is 0, which is the port number.

Each line shows the settings for a different Alert condition as defined in the ^SX command.

## ^HV – Host Verification

Use this command to return data from specified fields, along with an optional ASCII header, to the host computer. You can use this command with any field that has been assigned a number with the ^RT command or with the ^FN and ^RF commands.

**Format:** ^HV#,n,h,t,a

Parameters	Details
# = field number specified with another command	The value assigned to this parameter should be the same as the one used in another command. <b>Values:</b> 0 to 9999 <b>Default:</b> 0
n = number of bytes to be returned	<b>Values:</b> 1 to 256 <b>Default:</b> 64
h = header to be returned with the data	Delimiter characters terminate the string. This field is Field Hex (^FH) capable. <b>Values:</b> 0 to 3072 bytes <b>Default:</b> no header
t = termination	This field is Field Hex (^FH) capable. <b>Values:</b> 0 to 3072 characters
a = command applies to	When ^PQ is greater than 1 or if a void label occurs, send one response for a label format or one for every label printed. <b>Values:</b> F = Format L = Label <b>Default:</b> F

**Example:** The following code:

```
^XA
.
.
.
^FH_>HV0,8,EPC[,]_0D_0A,L^FS
^PQ2
^XZ
```

Would return data similar to this:

```
EPC[12345678]
EPC[55554444]
```

## ^HW – Host Directory List

**^HW** is used to transmit a directory listing of objects in a specific memory area (storage device) back to the host device. This command returns a formatted ASCII string of object names to the host.

Each object is listed on a line and has a fixed length. The total length of a line is also fixed. Each line listing an object begins with the asterisk (\*) followed by a blank space. There are eight spaces for the object name, followed by a period and three spaces for the extension. The extension is followed by two blank spaces, six spaces for the object size, two blank spaces, and three spaces for option flags (reserved for future use). The format looks like this:

```

<STX><CR><LF>
DIR R: <CR><LF>
*Name.ext(2sp.)(6 obj. sz.)(2sp.)(3 option flags)
*Name.ext(2sp.)(6 obj. sz.)(2sp.)(3 option flags)
<CR><LF>
-xxxxxx bytes free
<CR><LF>
<ETX>
<STX> = start of text
<CR><LR> = carriage return/line feed
<ETX> = end on text

```

The command might be used in a stand-alone file to be issued to the printer at any time. The printer returns the directory listing as soon as possible, based on other tasks it might be performing when the command is received.

This command, like all ^ (caret) commands, is processed in the order that it is received by the printer.

**Format:** ^HWd:o.x

Parameters	Details
d = location to retrieve object listing	<b>Values:</b> R:, E:, B:, A: and Z: <b>Default:</b> R:
o = object name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> asterisk (*). A question mark (?) can also be used.
x = extension	<b>Values:</b> any extension conforming to Zebra conventions <b>Default:</b> asterisk (*). A question mark (?) can also be used.
f = format  .16↑	<b>Values:</b> c = column format d = default format <b>Default:</b> d  The f parameter is only supported in firmware version V60.16.0Z and V53.16.0Z or later.

→ **Example:** Listed is an example of the ^HW command to retrieve information R:

```
^XA  
^HWR:*.  
^XZ
```

→ **Example:** The printer returned this information as the Host Directory Listing:-DIR R:\*.\*

```
*R:ARIALN1.FNT 49140  
*R:ARIALN2.FNT 49140  
*R:ARIALN3.FNT 49140  
*R:ARIALN4.FNT 49140  
*R:ARIALN.FNT 49140  
*R:ZEBRA.GRF 8420  
-794292 bytes free R:RAM
```

## ^HY – Upload Graphics

The ^HY command is an extension of the ^HG command. ^HY is used to upload graphic objects from the printer in any supported format.

**Format:** ^HYd:o.x

Parameters	Details
d = location of object	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> search priority
o = object name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> an object name must be specified
x = extension	<b>Values:</b> G = .GRF (raw bitmap format) P = .PNG (compressed bitmap format) <b>Default:</b> format of stored image

**Comments** The image is uploaded in the form of a ~DY command. The data field of the returned ~DY command is always encoded in the ZB64 format.

## ^HZ – Display Description Information

The ^HZ command is used for returning printer description information in XML format. The printer returns information on format parameters, object directories, individual object data, and print status information.

**Format:** ^HZ**b**

Parameters	Details
<b>b</b> = display description to return	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>a = display all information</li> <li>f = display printer format setting information</li> <li>l = display object directory listing information</li> <li>o = display individual object data information</li> <li>r = display printer status information</li> </ul> <p><b>Default:</b> if the value is missing or invalid, the command is ignored</p>

**Format** ^HZ**o,d:o.x,1**

Parameters	Details
<b>d</b> = location of stored object	<p><b>Values:</b> R:, E:, B:, and A:</p> <p><b>Default:</b> R:</p>
<b>o</b> = object name	<p><b>Values:</b> 1 to 8, or 1 to 16 alphanumeric characters based on parameter <b>1</b>.</p> <p><b>Default:</b> if a name is not specified, UNKNOWN is used.</p>
<b>x</b> = extension	<p>Supported extensions for objects (parameter <b>o</b>) include:</p> <ul style="list-style-type: none"> <li>.FNT — font</li> <li>.GRF — graphic</li> <li>.PNG — compressed graphic</li> <li>.ZPL — stored format</li> <li>.DAT — encoding table</li> <li>.ZOB — downloadable object</li> <li>.STO — Alert data file</li> </ul>
<b>1</b> = long filename support	<p><b>Values:</b></p> <p><b>Y</b> = Yes  If <b>Y</b>, the object data stores the filename as 16 characters. The data is only compatible with firmware version V60.13.0.5, or later.</p> <p><b>N</b> = No  If <b>N</b>, the object data stores the filename as 8 characters. The data is forward and backward compatible with all versions of firmware.</p> <p><b>Default:</b> N</p>

→ **Example:** This example shows the object data information for the object **SAMPLE.GRF** located on R::.

```
^XA
^HZ0,R:SAMPLE.GRF
^XZ
```

## ^ID – Object Delete

The ^ID command deletes objects, graphics, fonts, and stored formats from storage areas. Objects can be deleted selectively or in groups. This command can be used within a printing format to delete objects before saving new ones, or in a stand-alone format to delete objects.

The image name and extension support the use of the asterisk (\*) as a wild card. This allows you to easily delete a selected groups of objects.

**Format:** ^IDd:o.x

Parameters	Details
d = location of stored object	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
o = object name	<b>Values:</b> any 1 to 8 character name <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension	<b>Values:</b> any extension conforming to Zebra conventions <b>Default:</b> .GRF

- **Example 1:** To delete stored formats from DRAM:
 

```
^XA
^IDR:*.ZPL^FS
^XZ
```
- **Example 2:** To delete formats and images named SAMPLE from DRAM, regardless of the extension:
 

```
^XA
^IDR:SAMPLE.*^FS
^XZ
```
- **Example 3:** To delete the image SAMPLE1.GRF prior to storing SAMPLE2.GRF:
 

```
^XA
^FO25,25^AD,18,10
^FDDelete^FS
^FO25,45^AD,18,10
^FDthen Save^FS
^IDR:SAMPLE1.GRF^FS
^ISR:SAMPLE2.GRF^FS^XZ
```
- **Example 4:** In this the \* is a wild card, indicating that all objects with the .GRF extension are deleted:
 

```
^XA
^IDR:*.GRF^FS
^XZ
```

**Comments** When an object is deleted from **R:**, the object can no longer be used and memory is available for storage. This applies only to **R:**memory. With the other memory types (**A:**, **B:**, **E:**) the deleted object is no longer available. The memory space recovers when an automatic defragmentation or initialization occurs.

The **^ID** command also frees up the uncompressed version of the object in DRAM.

If the name is specified as **\*.ZOB**, all downloaded bar code fonts (or other objects) are deleted.

If the named downloadable object cannot be found in the **R:**, **E:**, **B:**, and **A:** device, the **^ID** command is ignored.

## ^IL - Image Load

The ^IL command is used at the beginning of a label format to load a stored image of a format and merge it with additional data. The image is always positioned at ^FO0,0.

**Important** • See [^IS on page 242](#).

Using this technique to overlay the image of constant information with variable data greatly increases the throughput of the label format.

**Format:** ^ILd:o.x

Parameters	Details
d = location of stored object	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
o = object name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension	<b>Fixed Value:</b> .GRF, .PNG

**Example:** This example recalls the stored image SAMPLE2.GRF from DRAM and overlays it with the additional data. The graphic was stored using the ^IS command. For the stored label format, see the [^IS on page 242](#) command.

ZPL II CODE	GENERATED LABEL								
<pre> ^XA ^ILR:SAMPLE2.GRF^FS ^CFD,36,20 ^FO15,210 ^FD900123^FS ^FO218,210 ^FDLINE 12^FS ^FO15,360^AD ^FDZEBRA THERMAL^FS ^FO15,400^AD ^FDTRANSFER PRINTER^FS ^FO15,540 ^FD54321^FS ^FO220,530 ^FDZ58643^FS ^FO15,670^A0,27,18 ^FDTesting Stored Graphic^FS ^FO15,700^A0,27,18 ^FDLabel Formats!!^FS ^XZ </pre>	<p><b>ZEBRA TECHNOLOGIES CORP</b></p> <table border="1"> <tr> <td>ARTICLE# 900123</td> <td>LOCATION LINE 12</td> </tr> <tr> <td colspan="2">DESCRIPTION ZEBRA THERMAL TRANSFER PRINTER</td> </tr> <tr> <td>REQ. DESCRIPTION ZEBRA THERMAL TRANSFER PRINTER									
REQ. NO. 54321	WORK NUMBER Z58643								
COMMENTS: Testing Stored Graphic Label Formats!!									

## ^IM – Image Move

The ^IM command performs a direct move of an image from storage area into the bitmap. The command is identical to the ^XG command (Recall Graphic), except there are no sizing parameters.

**Format:** ^IMd:o.x

Parameters	Details
d = location of stored object	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> search priority
o = object name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension	<b>Fixed Value:</b> .GRF, .PNG

→ **Example:** This example moves the image SAMPLE.GRF from DRAM and prints it in several locations in its original size.

```
^XA
^FO100,100^IMR:SAMPLE.GRF^FS
^FO100,200^IMR:SAMPLE.GRF^FS
^FO100,300^IMR:SAMPLE.GRF^FS
^FO100,400^IMR:SAMPLE.GRF^FS
^FO100,500^IMR:SAMPLE.GRF^FS
^XZ
```

**Comments** By using the ^FO command, the graphic image can be positioned anywhere on the label.

The difference between ^IM and ^XG: ^IM does not have magnification, and therefore might require less formatting time. However, to take advantage of this, the image must be at a 8-, 16-, or 32-bit boundary.

## ^IS - Image Save

The ^IS command is used within a label format to save that format as a graphic image, rather than as a ZPL II script. It is typically used toward the end of a script. The saved image can later be recalled with virtually no formatting time and overlaid with variable data to form a complete label.

Using this technique to overlay the image of constant information with the variable data greatly increases the throughput of the label format.

**Important** • See [^IL on page 240](#).

**Format:** ^ISd:o.x,p

Parameters	Details
d = location of stored object	<b>Values:</b> R:, E:, B:, and A: <b>Default:</b> R:
o = object name	<b>Values:</b> 1 to 8 alphanumeric characters <b>Default:</b> if a name is not specified, UNKNOWN is used
x = extension	<b>Values:</b> .GRF or .PNG <b>Default:</b> .GRF
p = print image after storing	<b>Values:</b> N = no Y = yes <b>Default:</b> Y

→ **Example:** This is an example of using the ^IS command to save a label format to DRAM. The name used to store the graphic is **SAMPLE2.GRF**.

ZPL II CODE	GENERATED LABEL
<pre>^XA ^LH10,15^FWN^BY3,3,85^CFD,36 ^GB430,750,4^FS ^FO10,170^GB200,144,2^FS ^FO10,318^GB410,174,2^FS ^FO212,170^GB206,144,2^FS ^FO10,498^GB200,120,2^FSR ^FO212,498^GB209,120,2^FS ^FO4,150^GB422,10,10^FS ^FO135,20^A0,70,60 ^FDZEBRA^FS ^FO80,100^A0,40,30 ^FDTECHNOLOGIES CORP^FS ^FO15,180^CFD,18,10^FS ^FDARTICLE#^FS ^FO218,180 ^FDLOCATION^FS ^FO15,328 ^FDDESCRIPTION^FS ^FO15,508 ^FDREQ.NO.^FS ^FO220,508 ^FDWORK NUMBER^FS ^FO15,630^AD,36,20 ^FDCOMMENTS:^FS ^ISR:SAMPLE2.GRF,Y ^XZ</pre>	<p><b>GENERATED LABEL</b></p> <p>The generated label template is a rectangular form divided into several sections. At the top center is a logo box containing "ZEBRA TECHNOLOGIES CORP". Below this are two side-by-side text boxes labeled "ARTICLE#" and "LOCATION". A large rectangular box below them is labeled "DESCRIPTION". Further down are two side-by-side text boxes labeled "REQ. NO." and "WORK NUMBER". At the bottom is a single text box labeled "COMMENTS:".</p>

## ~JA – Cancel All

The ~JA command cancels all format commands in the buffer. It also cancels any batches that are printing.

The printer stops after the current label is finished printing. All internal buffers are cleared of data and the DATA LED turn off.

Submitting this command to the printer scans the buffer and deletes only the data before the ~JA in the input buffer — it does not scan the remainder of the buffer for additional ~JA commands.

**Format:** ~JA

## ^JB – Initialize Flash Memory

The ^JB command is used to initialize various types of Flash memory available in the Zebra printers.

**Format:** ^JBa

Parameters	Details
a = device to initialize	<p><i>Acceptable Values:</i></p> <p>A = Option Flash memory B = Flash card (PCMCIA) E = internal Flash memory</p> <p><b>Default:</b> a device must be specified</p>

**Example:** This is an example of initializing the different types of flash memory:

- ^JBA – initializes initial Compact Flash memory when installed in the printer.
- ^JBB – initializes the optional Flash card when installed in the printer.
- ^JBE – initializes the optional Flash memory when installed in the printer.

**Note** • Initializing memory can take several minutes. Be sure to allow sufficient time for the initialization to complete before power cycling the printer.

## ~JB – Reset Optional Memory

The ~JB command is used for these conditions:

- The ~JB command must be sent to the printer if the battery supplying power to the battery powered memory card fails and is replaced. A bad battery shows a *battery dead* condition on the Printer Configuration Label.
- The ~JB command can also be used to intentionally clear (reinitialize) the B: memory card. The card must **not** be write protected.

**Format:** ~JB

**Comments** If the battery is replaced and this command is not sent to the printer, the memory card cannot function.

## ~JC – Set Media Sensor Calibration

The ~JC command is used to force a label length measurement and adjust the media and ribbon sensor values.

**Format:** ~JC

**Comments** In Continuous Mode, only the media and ribbon sensors are calibrated.

This command is ignored on the HC100™ printer.

## ~JD – Enable Communications Diagnostics

The ~JD command initiates Diagnostic Mode, which produces an ASCII printout (using current label length and full width of printer) of all characters received by the printer. This printout includes the ASCII characters, the hexadecimal value, and any communication errors.

**Format:** ~JD

## ~JE – Disable Diagnostics

The ~JE command cancels Diagnostic Mode and returns the printer to normal label printing.

**Format:** ~JE

## ~JF – Set Battery Condition

There are two low battery voltage levels sensed by the PA/PT400™ printers. When battery voltage goes below the first level, the green LED begins flashing as a warning but printing continues. When this warning occurs, it is recommended to recharge the battery.

As printing continues, a second low voltage level is reached. At this point, both green and orange LEDs flash as a warning, and printing automatically pauses.

When pause on low voltage is active (~JFY) and the battery voltage level falls below the second *low voltage* level, printing pauses and an error condition is displayed as an indication that the printer should be plugged into the battery charger. By pressing FEED, printing continues on a label-by-label basis, but there is a high risk of losing label format information due to the continued decrease of battery voltage.

When pause on low voltage is not active (~JFN), and the battery voltage level falls below the second *low voltage* level, printing continues and the orange LED remains off. If the battery voltage continues to decrease, label information could be lost and cause the printer to stop operating. This option should be selected only when the printer is connected to the Car Battery Adapter. From time to time the printer might sense that battery voltage is below the first *low voltage* level, but due to the continuous recharging of the car battery, further loss of battery voltage is not a concern and printing continues.

If this option is not selected when using the Car Battery Adapter, you might need to press FEED to take the printer out of Pause Mode and print each label.

**Format:** ~JFp

Parameters	Details
p = pause on low voltage	<b>Values:</b> Y (pause on low voltage) or N (do not pause) N is suggested when the printer is powered by the Car Battery Adapter. <b>Default:</b> Y

## ~JG – Graphing Sensor Calibration

The ~JG command prints a graph (media sensor profile) of the sensor values.

**Format:** ~JG

→ **Example:** Sending the ~JG command to a printer configured for thermal transfer produces a series of labels resembling this image:

**Comments** The HC100™ printer does not perform a calibration, but does print a sensor profile label.

## ^JH – Early Warning Settings

The ^JH command configures the early warning messages that appear on the LCD.

### Supported Devices

- ZE500 series
- *XiIII, XiIIIPplus, Xi4, RXi4*
- *PAX3, PAX4*
- ZM400, ZM600, RZ400, RZ600
- S4M
- G-Series (“f” parameter only)

Format: ^JHa,b,c,d,e,f,g,h,i,j

Parameter	Details
<b>a</b> = early warning media <b>a</b> = supplies warning ( <i>Xi4 and RXi4 printers only</i> )	This parameter is for <i>XiIIIPplus, Xi4, RXi4, PAX3, and PAX4</i> printers only. <b>Values:</b> E = enable D = disable <b>Default:</b> D
<b>b</b> = labels per roll	This parameter is for <i>XiIIIPplus, PAX3, and PAX4</i> printers only. <b>Values:</b> 100 to 9999 <b>Default:</b> 900
<b>c</b> = media replaced	This parameter is for <i>XiIIIPplus, PAX3, and PAX4</i> printers only. <b>Values:</b> Y = yes N = no <b>Default:</b> N

Parameter	Details																																				
<b>d = ribbon length</b>	<p>This parameter is for <i>XIIIPlus</i>, <i>PAX3</i>, <i>PAX4</i>, and <i>ZE500</i> printers only.</p> <p><b>Values:</b></p> <p><i>XIIIPlus</i> series printers:</p> <table> <tbody> <tr><td><b>N = 0M</b></td><td></td></tr> <tr><td><b>0 = 100M</b></td><td><b>4 = 300M</b></td></tr> <tr><td><b>1 = 150M</b></td><td><b>5 = 350M</b></td></tr> <tr><td><b>2 = 200M</b></td><td><b>6 = 400M</b></td></tr> <tr><td><b>3 = 250M</b></td><td><b>7 = 450M</b></td></tr> </tbody> </table> <p><b>PAX</b> series printers:</p> <table> <tbody> <tr><td><b>N = 0M</b></td><td><b>7 = 450M</b></td></tr> <tr><td><b>0 = 100M</b></td><td><b>10 = 600M</b></td></tr> <tr><td><b>1 = 150M</b></td><td><b>11 = 650M</b></td></tr> <tr><td><b>2 = 200M</b></td><td><b>12 = 700M</b></td></tr> <tr><td><b>3 = 250M</b></td><td><b>13 = 750M</b></td></tr> <tr><td><b>4 = 300M</b></td><td><b>14 = 800M</b></td></tr> <tr><td><b>5 = 350M</b></td><td><b>15 = 850M</b></td></tr> <tr><td><b>6 = 400M</b></td><td><b>16 = 900M</b></td></tr> </tbody> </table> <p><b>ZE500</b> series printers:</p> <table> <tbody> <tr><td><b>N = 0M</b></td><td><b>4 = 300M</b></td></tr> <tr><td><b>0 = 100M</b></td><td><b>5 = 350M</b></td></tr> <tr><td><b>1 = 150M</b></td><td><b>6 = 400M</b></td></tr> <tr><td><b>2 = 200M</b></td><td><b>7 = 450M</b></td></tr> <tr><td><b>3 = 250M</b></td><td><b>10 = 600M</b></td></tr> </tbody> </table> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li><b>1</b> - for <i>96XIIIPlus</i></li> <li><b>7</b> - for all other printers</li> </ul>	<b>N = 0M</b>		<b>0 = 100M</b>	<b>4 = 300M</b>	<b>1 = 150M</b>	<b>5 = 350M</b>	<b>2 = 200M</b>	<b>6 = 400M</b>	<b>3 = 250M</b>	<b>7 = 450M</b>	<b>N = 0M</b>	<b>7 = 450M</b>	<b>0 = 100M</b>	<b>10 = 600M</b>	<b>1 = 150M</b>	<b>11 = 650M</b>	<b>2 = 200M</b>	<b>12 = 700M</b>	<b>3 = 250M</b>	<b>13 = 750M</b>	<b>4 = 300M</b>	<b>14 = 800M</b>	<b>5 = 350M</b>	<b>15 = 850M</b>	<b>6 = 400M</b>	<b>16 = 900M</b>	<b>N = 0M</b>	<b>4 = 300M</b>	<b>0 = 100M</b>	<b>5 = 350M</b>	<b>1 = 150M</b>	<b>6 = 400M</b>	<b>2 = 200M</b>	<b>7 = 450M</b>	<b>3 = 250M</b>	<b>10 = 600M</b>

<b>h = head clean</b>	<p><b>Values:</b></p> <p><b>N</b> = No  <b>Y</b> = Yes</p> <p><b>Default:</b> <b>N</b></p>																						
<b>i = head life threshold</b>	<p><b>Values:</b></p> <p>0 – 0 in or off      100-3500000 in</p> <p><b>Default:</b> 1000000</p>																						
<b>j = head replaced</b>	<p><b>Values:</b></p> <p><b>N</b> = no  <b>Y</b> = yes</p> <p><b>Default:</b> <b>N</b></p>																						

**Comments** To permanently save the changes to the ^JH command, send ^XA^JUS^XZ.

## ^JI – Start ZBI (Zebra BASIC Interpreter)

**.161**

Identifies features that are available in printers with firmware version V60.16.2Z, V53.16.2Z, or later.

**Description** ^JI works much like the ~JI command. Both commands are sent to the printer to initialize the Zebra BASIC Interpreter.

In interactive mode, ^JI can be sent through one of the communication ports (serial, parallel, or Ethernet) to initialize the printer to receive ZBI commands. This command can be sent from one of the Zebra software utilities, such as ZTools, or from a terminal emulation program.

When the command is received, the printer responds by sending a ZBI header back to the console, along with the program version number. This indicates that the interpreter is active.

**Format** ^JI<sub>d</sub>:o.x,b,c,d

Parameters	Details
d = location of program to run after initialization	<p><b>Acceptable Values:</b> R:, E:, B:, and A:  <b>Default:</b> location must be specified</p>
o = name of program to run after initialization	<p><b>Values:</b> any valid program name  <b>Default:</b> name must be specified</p>
x = extension of program to run after initialization	<p><b>Fixed Value:</b> .BAS, .BAE   .BAE is only supported in firmware version V60.16.0Z or later</p>
b = console control	<p><b>Values:</b>  Y = console on  N = console off  <b>Default:</b> Y</p>
c = echoing control	<p><b>Values:</b>  Y = echo on  N = echo off  <b>Default:</b> Y</p>
d = memory allocation for ZBI *	<p><b>Values:</b> 20K to 1024K  <b>Default:</b> 50K</p>

\* This parameter is only available on printers with firmware V60.12.0.x or earlier.

**Comments** When the printer is turned on, it can receive ZPL II commands and label formats. However, for the printer to recognize ZBI commands and programs, it must be initialized using ^JI or ~JI.

Only one ZBI interpreter can be active in the printer at a time. If a second ^JI or ~JI command is received while the interpreter is running, the command is ignored.

The interpreter is deactivated by entering one of two commands:

**ZPL** at the ZBI prompt

**~JQ** at an active ZPL port

## ~JI – Start ZBI (Zebra BASIC Interpreter)

.161

Identifies features that are available in printers with firmware version V60.16.2Z, V53.16.2Z, or later.

**Description** ~JI works much like the ^JI command. Both commands are sent to the printer to initialize the Zebra BASIC Interpreter.

In interactive mode, ~JI can be sent through one of the communication ports (serial, parallel, or Ethernet) to initialize the printer to receive ZBI commands. This command can be sent from one of the Zebra software utilities, such as ZTools, or from a standard PC program, such as Hyper terminal.

When the command is received, the printer responds by sending a ZBI header back to the console, along with the program version number. This indicates that the interpreter is active.

### Format ~JI

**Comments** While receiving commands, the printer *echoes* the received characters back to the source. This can be toggled on and off with the ZBI ECHO command.

When the printer is turned on, it can receive ZPL II commands and label formats. However, for the printer to recognize ZBI commands and formats, it must be initialized using ^JI or ~JI.

Only one ZBI interpreter can be active in the printer at a time. If a second ~JI or ^JI command is received while the interpreter is running, the command is ignored.

The interpreter is deactivated by entering one of these commands:

- ZPL at the ZBI prompt
- ~JQ at an active ZPL port

## ^JJ – Set Auxiliary Port

The ^JJ command allows you to control an online verifier or applicator device.

**Format:** ^JJa,b,c,d,e,f

Parameters	Details
a = operational mode for auxiliary port	<p><i>Accepted Values:</i></p> <p>0 = off</p> <p>1 = reprint on error—the printer stops on a label with a verification error. When PAUSE is pressed, the label reprints (if ^JZ is set to reprint). If a bar code is near the upper edge of a label, the label feeds out far enough for the bar code to be verified and then backfeeds to allow the next label to be printed and verified.</p> <p>2 = maximum throughput—the printer stops when a verification error is detected. The printer starts printing the next label while the verifier is still checking the previous label. This mode provides maximum throughput, but does not allow the printer to stop immediately on a label with a verification error.</p> <p><b>Default: 0</b></p>
b = application mode	<p><i>Accepted Values:</i></p> <p>0 = off</p> <p>1 = End Print signal normally high, and low only when the printer is moving the label forward.</p> <p>2 = End Print signal normally low, and high only when the printer is moving the label forward.</p> <p>3 = End Print signal normally high, and low for 20 ms when a label has been printed and positioned.</p> <p>4 = End Print signal normally low, and high for 20 ms when a label has been printed and positioned.</p> <p><b>Default: 0</b></p> <p> <b>Note</b> • The Set/Get/Do command <a href="#">device.applicator.end_print</a> on page 663 controls the same setting as the b parameter.</p>
c = application mode start signal print	<p><b>Values:</b></p> <p>p = Pulse Mode – Start Print signal must be de-asserted before it can be asserted for the next label.</p> <p>1 = Level Mode – Start Print signal does not need to be de-asserted to print the next label. As long as the Start Print signal is low and a label is formatted, a label prints.</p> <p><b>Default: 0</b></p>

Parameters	Details
<b>d</b> = application label error mode	<p><i>Accepted Values:</i></p> <p><b>e</b> = error mode—the printer asserts the <i>Service Required</i> signal (svce_req - pin 10) on the application port, enters into Pause Mode, and displays an error message on the LCD.</p> <p><b>f</b> = Feed Mode—a blank label prints when the web is not found where expected to sync the printer to the media.</p> <p><b>Default:</b> f</p>
<b>e</b> = reprint mode	<p><i>Accepted Values:</i></p> <p><b>e</b> = enabled—the last label reprints after the signal is asserted. If a label is canceled, the label to be reprinted is also canceled. This mode consumes more memory because the last printed label is not released until it reprints.</p> <p><b>d</b> = disabled—printer ignores the Reprint signal.</p> <p><b>Default:</b> d</p>
<b>f</b> = ribbon low mode	<p><i>Accepted Values:</i></p> <p><b>e</b> = <i>enabled</i> – printer warning issued when ribbon low.</p> <p><b>d</b> = <i>disabled</i> – printer warning not issued when ribbon low.</p> <p><b>Default:</b> e</p>

## **~JL – Set Label Length**

The ~JL command is used to set the label length. Depending on the size of the label, the printer feeds one or more blank labels.

**Format:** ~JL

## ^JM – Set Dots per Millimeter

The ^JM command lowers the density of the print—24 dots/mm becomes 12, 12 dots/mm becomes 6, 8 dots/mm becomes 4, and 6 dots/mm becomes 3. ^JM also affects the field origin (^FO) placement on the label (see example below).

When sent to the printer, the ^JM command doubles the format size of the label. Depending on the printhead, normal dot-per-millimeter capabilities for a Zebra printer are 12 dots/mm (304 dots/inch), 8 dots/mm (203 dots/inch) or 6 dots/mm (153 dots/inch).

This command must be entered before the first ^FS command in a format. The effects of ^JM are persistent.

**Format:** ^JMn

Parameters	Details
n = set dots per millimeter	<b>Values:</b> A = 24 dots/mm, 12 dots/mm, 8 dots/mm or 6 dots/mm B = 12 dots/mm, 6 dots/mm, 4 dots/mm or 3 dots/mm <b>Default:</b> A

→ **Example:** This example of the affects of alternating the dots per millimeter:

ZPL II CODE	GENERATED LABEL
<pre> ^XA ^JMA^FS ^FO100,100 ^B2N,50,Y,N,N ^FD1234567890^FS ^XZ </pre>	
<pre> ^XA ^JMB^FS ^FO100,100 ^B2N,50,Y,N,N ^FD1234567890^FS ^XZ </pre>	

**Comments** If ^JMB is used, the UPS MaxiCode bar code becomes out of specification.

## ~JN – Head Test Fatal

The ~JN command turns on the head test option. When activated, ~JN causes the printer to halt when a head test failure is encountered.

Once an error is encountered the printer remains in error mode until the head test is turned off (~J0) or power is cycled.

**Format:** ~JN

**Comments** If the communications buffer is full, the printer is not able to receive data. In this condition, the ~J0 command is not received by the printer.

## ~JO – Head Test Non-Fatal

The **~JO** command configures the printer to run the head test with error reporting enabled. When **~JO** is used an error will be displayed and printing will stop if the head test fails. The user can push the PAUSE button on the printer to bypass the error. This command differs from the **~JN** (Head Test Fatal) command in that a power cycle is not required in the event of a head test failure.

**~JO** is the default print head test condition. This setting is changed when the printer receives a **~JN** (Head Test Fatal) command.

**Format:** ~JO

## ~JP – Pause and Cancel Format

The ~JP command clears the format currently being processed and places the printer into Pause Mode.

The command clears the next format that would print, or the oldest format from the buffer. Each subsequent ~JP command clears the next buffered format until the buffer is empty. The DATA indicator turns off when the buffer is empty and no data is being transmitted.

Issuing the ~JP command is identical to using CANCEL on the printer, but the printer does not have to be in Pause Mode first.

**Format:** ~JP

## ~JQ – Terminate Zebra BASIC Interpreter

.161

Identifies features that are available in printers with firmware version V60.16.2Z, V53.16.2Z, or later.

**Description** The ~JQ command is used when Zebra BASIC Interpreter is active. Sending ~JQ to the printer terminates the ZBI session.

**Format** ~JQ

**Comments** Entering ZPL at the command prompt also terminates a ZBI session.

## **~JR – Power On Reset**

The ~JR command resets all of the printer's internal software, performs a power-on self-test (POST), clears the buffer and DRAM, and resets communication parameters and default values. Issuing a ~JR command performs the same function as a manual power-on reset.

**Format:** ~JR

## ^JS – Sensor Select

Format: ^JSa

**Note** • This command is ignored on Zebra ZM400/ZM600 and RZ400/RZ600 printers. This command is only for use with the S4M and Z Series printers (with the exception of the ZM400/ZM600/RZ400/RZ600).

Parameters	Details
a = sensor selection	<p><i>Accepted Values:</i></p> <p>A = auto select R = reflective sensor T = transmissive sensor</p> <p><i>Default:</i></p> <p>Z series = A S4M = R</p>

## ~JS – Change Backfeed Sequence

The **~JS** command is used to control the backfeed sequence. This command can be used on printers with or without built-in cutters.

These are the primary applications:

- to allow programming of the *rest point* of the cut edge of continuous media.
- provide immediate backfeed after peel-off when the printer is used in a print/apply application configuration.

This command stays in effect only until the printer is turned off, a new **~JS** command is sent, or the setting is changed on the control panel. When a **~JS** command is encountered, it overrides the current control panel setting for the Backfeed Sequence.

The most common way of eliminating backfeed is to operate in Rewind Mode. Rewind Mode does not backfeed at all. After a label prints, the leading edge of the next label is placed at the print line. This eliminates the need to backfeed and does not introduce a non printable area at the leading edge or bottom of the label. It also does not allow the label to be taken from the printer because it is not fed out from under the printhead.

Running in another mode with backfeed turned off allows the label to be removed and eliminates the time-reduction of the backfeed sequence.

**Format:** ~JSb

Parameters	Details
<b>b</b> = backfeed order in relation to printing	<p><i>Accepted Values:</i></p> <p><b>A</b> = 100 percent backfeed after printing and cutting  <b>B</b> = 0 percent backfeed after printing and cutting, and 100 percent before printing the next label  <b>N</b> = normal — 90 percent backfeed after label is printed  <b>O</b> = off — turn backfeed off completely  <b>10 to 90</b> = percentage value  The value entered must be a multiple of 10. Values not divisible by 10 are rounded to the nearest acceptable value. For example, <b>~JS55</b> is accepted as 50 percent backfeed.</p> <p><b>Default:</b> N</p>

**Comments** When using a specific value, the difference between the value entered and 100 percent is calculated before the next label is printed. For example, a value of 40 means 40 percent of the backfeed takes place after the label is cut or removed. The remaining 60 percent takes place before the next label is printed.

The value for this command is also reflected in the Backfeed parameter on the printer configuration label.

- For **~JSN** — the Backfeed parameter is listed as DEFAULT
- For **~JSA** — or 100% the Backfeed parameter is listed as AFTER
- For **~JSB** — or 0% the Backfeed parameter is listed as BEFORE
- For **~JS10** — 10% of the backfeed takes place after the label is cut or removed. The remaining 90% takes place before the next label is printed.

This command is ignored on the HC100™ printer.

## ^JT – Head Test Interval

The ^JT command allows you to change the printhead test interval from every 100 labels to any desired interval. With the ^JT command, the printer is allowed to run the test after printing a label. When a parameter is defined, the printer runs the test after printing a set amount of labels.

The printer's default head test state is off. Parameters for running the printhead test are defined by the user.

**Format:** ^JT####,a,b,c

Parameters	Details
<b>####</b> = four-digit number of labels printed between head tests	<b>Values:</b> 0000 to 9999 If a value greater than 9999 is entered, it is ignored. <b>Default:</b> 0000 (off)
<b>a</b> = manually select range of elements to test	<b>Values:</b> N = no Y = yes <b>Initial Value at Power Up:</b> N
<b>b</b> = first element to check when parameter <b>a</b> is Y	<b>Values:</b> 0 to 9999 <b>Initial Value at Power Up:</b> 0
<b>c</b> = last element to check when parameter <b>a</b> is Y	<b>Values:</b> 0 to 9999 <b>Initial Value at Power Up:</b> 9999

**Comments** The ^JT command supports testing a range of print elements. The printer automatically selects the test range by tracking which elements have been used since the previous test.

^JT also turns on Automatic Mode to specify the first and last elements for the head test. This makes it possible to select any specific area of the label or the entire print width.

If the last element selected is greater than the print width selected, the test stops at the selected print width.

Whenever the head test command is received, a head test is performed on the next label unless the count is set to 0 (zero).

## ^JU – Configuration Update

The ^JU command sets the active configuration for the printer.

**Format:** ^JUa

Parameters	Details
a = active configuration	<p><i>Accepted Values:</i></p> <p>F = reload factory settings N = reload factory network settings These values are lost at power-off if not saved with ^JUS. R = recall last saved settings S = save current settings These values are used at power-on.</p> <p><b>Default:</b> a value must be specified</p>

## ^JW – Set Ribbon Tension

^JW sets the ribbon tension for the printer it is sent to.

**Format:** ^JWt

Parameters	Details
t = tension	<p><i>Accepted Values:</i></p> <p>L = low</p> <p>M = medium</p> <p>H = high</p> <p><b>Default:</b> a value must be specified</p>

**Comments** ^JW is used only for PAX series printers.

## **~JX – Cancel Current Partially Input Format**

The ~JX command cancels a format currently being sent to the printer. It does not affect any formats currently being printed, or any subsequent formats that might be sent.

**Format:** ~JX

## ^JZ – Reprint After Error

The ^JZ command reprints a partially printed label caused by a **Ribbon Out**, **Media Out**, or **Head Open** error condition. The label is reprinted as soon as the error condition is corrected.

This command remains active until another ^JZ command is sent to the printer or the printer is turned off.

**Format:** ^JZa

Parameters	Details
a = reprint after error	<b>Values:</b> N = no Y = yes <b>Initial Value at Power Up:</b> Y

**Comments** ^JZ sets the error mode for the printer. If ^JZ changes, only labels printed after the change are affected.

If the parameter is missing or incorrect, the command is ignored.

## ~KB – Kill Battery (Battery Discharge Mode)

To maintain performance of the rechargeable battery in the portable printers, the battery must be fully discharged and recharged regularly. The ~KB command places the printer in battery discharge mode. This allows the battery to be drained without actually printing.

**Format:** ~KB

**Comments** While the printer is in Discharge Mode, the green power LED flashes in groups of three flashes.

Discharge Mode might be terminated by sending a printing format to the printer or by pressing either of the control panel keys.

If the battery charger is plugged into the printer, the battery is automatically recharged once the discharge process is completed.

## ^KD – Select Date and Time Format (for Real Time Clock)

The ^KD command selects the format that the Real-Time Clock's date and time information presents as on a configuration label. This is also displayed on the *Printer Idle* LCD control panel display, and displayed while setting the date and time.

**Format:** ^KDa

Parameters	Details
a = value of date and time format	<b>Values:</b> <b>0</b> = normal, displays <i>Version Number</i> of firmware <b>1</b> = MM/DD/YY (24-hour clock) <b>2</b> = MM/DD/YY (12-hour clock) <b>3</b> = DD/MM/YY (24-hour clock) <b>4</b> = DD/MM/YY (12-hour clock) <b>Default:</b> 0

**Comments** If the Real-Time Clock hardware is not present, Display Mode is set to 0 (Version Number).

If Display Mode is set to 0 (Version Number) and the Real-Time Clock hardware is present, the date and time format on the configuration label is presented in format 1.

If Display Mode is set to 0 (Version Number) and the Real-Time Clock hardware is present, the date and time format on the control panel display is presented in format 1.

For more details on select date and time format for the Real Time Clock, see [Real Time Clock on page 1347](#).

## ^KL – Define Language

The ^KL command selects the language displayed on the control panel.

**Format:** ^KLa

Parameters	Details
a = language	<p><i>Accepted Values:</i></p> <p><b>1</b> = English <b>2</b> = Spanish <b>3</b> = French <b>4</b> = German <b>5</b> = Italian <b>6</b> = Norwegian <b>7</b> = Portuguese <b>8</b> = Swedish <b>9</b> = Danish <b>10</b> = Spanish2 <b>11</b> = Dutch <b>12</b> = Finnish <b>13</b> = Japanese <b>14</b> = Korean / <b>15</b> = Simplified Chinese / <b>16</b> = Traditional Chinese / <b>17</b> = Russian / <b>18</b> = Polish / <b>19</b> = Czech / <b>20</b> = Romanian /</p> <p><b>Default:</b> 1</p>

- I. These values are only supported on the ZT200 Series, ZE500 Series, Xi4, RXi4, ZM400/ ZM600, and RZ400/RZ600 printers.

## ^KN – Define Printer Name

The printer's network name and description can be set using the ^KN command. ^KN is designed to make your Zebra printer easy for users to identify. The name the administrator designates is listed on the configuration label and on the Web page generated by the printer.

**Format:** ^KNa,b

**Note •** If you issue the command ^KN, (without the a and b parameters) you are setting the printer name and description to a blank string.

To cause the printer name and printer description settings controlled by the ^KN command to be saved, you must issue the ^JUS command.

Parameters	Details
a = printer name	<b>Values:</b> up to 16 alphanumeric characters <b>Default:</b> <ul style="list-style-type: none"><li>If no printer name is specified in a printer with a MAC address, the printer name will default to "ZBRxxx," where xxx is the last three octets of the MAC address converted into ASCII text.</li><li>For printers without a MAC address, if a value is not entered, the current stored value is erased.</li></ul> If more than 16 characters are entered, only the first 16 are used.
b = printer description	<b>Values:</b> up to 35 alphanumeric characters <b>Default:</b> if a value is not entered, the current stored value is erased If more than 35 characters are entered, only the first 35 are used. <b>Note •</b> The value of this parameter will be displayed on the printer's web page in parentheses.

**Example:** This is an example of how to change the printer's network name and description:

This shows how a configuration looks before using this command and after using this command:

```
^XA
^KNZebral,desk_printer
^XZ
```

**Before using this command:**

## ^KP – Define Password

The ^KP command is used to define the password that must be entered to access the control panel switches and LCD Setup Mode.

**Format:** ^KPa,b

Parameters	Details
a = mandatory four-digit password	<b>Values:</b> any four-digit numeric sequence <b>Default:</b> 1234
b = password level	<b>Values:</b> 1, 2, 3, 4 <b>Default:</b> 3 <b>Note</b> • The b parameter applies only to the S4M printers.

→ **Example 1:** This example shows how to set a new control panel password:

```
^XA  
^KP5678  
^XZ
```

→ **Example 2:** This example shows how to set a new control panel password (5678) at a specific password level (level 2) (applicable to the S4M printer only):

```
^XA  
^KP5678,2  
^XZ
```

**Comments** If you forget your password, the printer can be returned to a default Setup Mode and the default password 1234 is valid again. Caution should be used, however — this also sets the printer configuration values back to their defaults.

To return the printer to the default factory settings using ZPL, send this:

```
^XA  
^JUF  
^XZ
```

To return the printer to the default factory settings using the control panel keys, see your printer's User Guide for the procedure.

## ^KV – Kiosk Values

The ^KV command sets several parameters that affect the printers operation when ^MM is set to K - Kiosk mode

### Supported Devices

- KR403

**Format:** ^KVa,b,c,d,e

Parameters	Details
a = kiosk cut amount	<p><b>Values:</b></p> <p>0 = normal cut 10–60 = partial cut, value = mm of media left uncut</p> <p><b>Default:</b> 0</p> <p>This parameter is ignored if it is missing or invalid. The current value of the parameter remains unchanged.</p>
b = kiosk cut margin	<p><b>Values:</b></p> <p>2 – 9 = mm of distance</p> <p><b>Default:</b></p> <p>9 = mm of distance</p> <p>This parameter is ignored if it is missing or invalid. The current value of the parameter remains unchanged.</p>
c = kiosk present type	<p><b>Values:</b></p> <p>0 = Eject page when new page is printed 1 = Retract page when new page is printed 2 = Do nothing when new page is printed</p> <p><b>Default:</b> 0</p> <p>This parameter is ignored if it is missing or invalid. The current value of the parameter remains unchanged.</p>
d = kiosk present timeout	<p><b>Values:</b></p> <p>0–300 = If label is not taken, retract label when timeout expires. Timeout is in seconds. Zero (0) indicates that there is no timeout. The label will stay presented until removed manually or a new label is printed.</p> <p><b>Default:</b> 0</p> <p>This parameter is ignored if it is missing or invalid. The current value of the parameter remains unchanged.</p>

Parameters	Details
e = presenter loop length	<p><b>Values:</b></p> <p>0 = paper is fed straight through the presenter 3-1023 = loop length in mm.</p> <p><b>Default: 400</b></p> <p>400= gives a loop of approximately 400mm</p> <p>This parameter is ignored if it is missing or invalid. The current value of the parameter remains unchanged.. If this is greater than loop_length_max (see SGD media.present.loop_length_max) then it will be set equal to loop_length_max.</p>

## Kiosk Printing Examples

The following examples demonstrate the use of the ^KV, ^CN, ^PN and ^CP commands with 80mm wide continuous media and the printer set to Kiosk Mode (^MMK).

**Example 1:** In this example, the ^KV command is set to the following:

- Cut - Full Cut
  - Cut Margin - 9 mm
  - Present Type - Eject page when the next page is printed
  - Present Timeout - 6 seconds after printing, if the document is not taken, it will be retracted
  - Presenter Loop Length - No loop
- ```

^XA
^MMK
^KV0,9,0,6,0
^F050,50^A0N,50,50^FDZebra Technologies^FS
^CN1
^PN0
^XZ

```

**Note** • The ^CN1 command (Cut Now) is included to ensure that a full cut is done. The ^PN0 (Present Now) command is included to ensure that the media is ejected when the user pulls on the leading edge of the media. In this example, if the user does not pull on the leading edge of the second document, it will be retracted.

- **Example 2:** This example contains only one change from the Example 1 - the Presenter Loop Length is now 100mm, and two documents will be printed instead of one.

```
^XA  
^MMK  
^KV0,9,2,6,100  
^FO50,50^A0N,50,50^FDZebra Technologies^FS  
^CN1^PN0  
^PQ2  
^XZ
```

- **Example 3:** In this example, two documents will be printed, each one will be ejected from the printer.

```
^XA  
^MMK  
^KV0,9,2,6,100  
^FO50,50^A0N,50,50^FDZebra Technologies^FS  
^CN1^CP0  
^PQ2  
^XZ
```

- **Example 4:** In this example, two documents, with partial cuts, will be printed, and a third document, with a full cut, will be printed.

```
^XA  
^MMK  
^KV50,9,0,0,0  
^FO50,50^A0N,50,50^FDPartial Cut^FS  
^CN0^PN0  
^PQ2  
^XZ  
^XA  
^MMK  
^KV0,9,2,6,0  
^FO50,50^A0N,50,50^FDFull Cut^FS  
^CN1^CP0  
^XZ
```

**Example 5:** In this example, four documents will be printed – three with a partial cut and the fourth with a full cut. Additionally, the document length is set to 406 dots and the Media Tracking mode is set to "Continuous Media, Variable Length". The third document contains fields that are positioned outside of the 406 dot length – however, because the printer is set to "Continuous Media, Variable Length" Media Tracking mode, the printer will automatically adjust the document length to compensate.

```

```

## ^LF – List Font Links

.14↑

This command is available only for printers with firmware version V60.14.x, V50.14.x, or later.

The ^LF command prints out a list of the linked fonts.

- **Example:** This example shows that **SWISS721.TTF** is the based font. **ANMDJ.TTF** is the first linked font, and **MSGOTHIC.TTF** is the second linked extension:

| ZPL II CODE            | GENERATED LABEL                                                                    |
|------------------------|------------------------------------------------------------------------------------|
| <pre>^XA ^LF ^XZ</pre> | <p>LIST OF FONT LINKS</p> <p>E:SWISS721.TTF<br/>E:ANMDJ.TTF<br/>E:MSGOTHIC.TTF</p> |

This is the code that established the font links:

```
^XA
^FLE:ANMDJ.TTF,E:SWISS721.TTF,1^FS
^FLE:MSGOTHIC.TTF,E:SWISS721.TTF,1^FS
^XZ
```

## ^LH – Label Home

The ^LH command sets the label home position.

The default home position of a label is the upper-left corner (position 0,0 along the x and y axis). This is the axis reference point for labels. Any area below and to the right of this point is available for printing. The ^LH command changes this reference point. For instance, when working with preprinted labels, use this command to move the reference point below the preprinted area.

This command affects only fields that come after it. It is recommended to use ^LH as one of the first commands in the label format.

**Format:** ^LHx,y

| Parameters                    | Details                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------|
| x = x-axis position (in dots) | <b>Values:</b> 0 to 32000<br><b>Initial Value at Power Up:</b> 0 or last permanently saved value |
| y = y-axis position (in dots) | <b>Values:</b> 0 to 32000<br><b>Initial Value at Power Up:</b> 0 or last permanently saved value |

Depending on the printhead used in your printer, use one of these when figuring the values for x and y:

6 dots = 1 mm, 152 dots = 1 inch  
8 dots = 1 mm, 203 dots = 1 inch  
11.8 dots = 1 mm, 300 dots = 1 inch  
24 dots = 1 mm, 608 dots = 1 inch

**Comments** To be compatible with existing printers, this command must come before the first ^FS (Field Separator) command. Once you have issued an ^LH command, the setting is retained until you turn off the printer or send a new ^LH command to the printer.

## ^LL – Label Length

The ^LL command defines the length of the label. This command is necessary when using continuous media (media not divided into separate labels by gaps, spaces, notches, slots, or holes).

To affect the current label and be compatible with existing printers, ^LL must come before the first ^FS (Field Separator) command. Once you have issued ^LL, the setting is retained until you turn off the printer or send a new ^LL command.

**Format:** ^LLy

| Parameters                    | Details                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y = y-axis position (in dots) | <p><b>Values:</b> 1 to 32000, not to exceed the maximum label size.<br/> While the printer accepts any value for this parameter, the amount of memory installed determines the maximum length of the label.</p> <p><b>Default:</b> typically set through the LCD (if applicable), or to the maximum label length capability of the printer.</p> |

**Comments** These formulas can be used to determine the value of y:

**For 6 dot/mm printheads...** Label length in inches x 152.4 (dots/inch) = y

**For 8 dot/mm printheads...** Label length in inches x 203.2 (dots/inch) = y

**For 12 dot/mm printheads...** Label length in inches x 304.8 (dots/inch) = y

**For 24 dot/mm printheads...** Label length in inches x 609.6 (dots/inch) = y

Values for y depend on the memory size. If the entered value for y exceeds the acceptable limits, the bottom of the label is cut off. The label also shifts down from top to bottom.

If multiple ^LL commands are issued in the same label format, the last ^LL command affects the next label unless it is prior to the first ^FS.

This command is ignored on the HC100™ printer.

## ^LR – Label Reverse Print

The ^LR command reverses the printing of all fields in the label format. It allows a field to appear as white over black or black over white.

Using the ^LR is identical to placing an ^FR command in all current and subsequent fields.

**Format:** ^LRA

| Parameters                   | Details                                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------------------|
| a = reverse print all fields | <b>Values:</b><br>N = no<br>Y = yes<br><b>Initial Value at Power Up:</b> N or last permanently saved value |

**Example:** This is an example that shows printing white over black and black over white. The ^GB command is used to create the black background.

| ZPL II CODE                                                                                              | GENERATED LABEL |
|----------------------------------------------------------------------------------------------------------|-----------------|
| <pre> ^XA^LRY ^FO100,50 ^GB195,203,195^FS ^FO180,110^CFG ^FDLABEL^FS ^FO130,170 ^FDREVERSE^FS ^XZ </pre> |                 |

**Comments** The ^LR setting remains active unless turned off by ^LRN or the printer is turned off.

**Note •** ^GB needs to be used together with ^LR.

Only fields following this command are affected.

## ^LS – Label Shift

The ^LS command allows for compatibility with Z-130 printer formats that are set for less than full label width. It is used to shift all field positions to the left so the same commands used on a Z-130 or Z-220 Printer can be used on other Zebra printers.

To determine the value for the ^LS command, use this formula:

**Z-130 and Z-220 values for ^LHx + ^FOx**  
(distance from edge of label) = printer value for ^LSa

If the print position is less than 0, set ^LS to 0.

**Format:** ^LSa

**Important** • The ability to save the ^LS command depends on the version of firmware.

| Parameters                     | Details                                                             |
|--------------------------------|---------------------------------------------------------------------|
| a = shift left value (in dots) | <b>Values:</b> -9999 to 9999<br><b>Initial Value at Power Up:</b> 0 |

**Comments** When entering positive values, it is not necessary to use the + sign. The value is assumed to be positive unless preceded by a negative sign (-).

To be compatible with existing Zebra printers, this command must come before the first ^FS (Field Separator) command. Once you have issued an ^LS command, the setting is retained until you turn off the printer or send a new ^LS command to the printer.

## ^LT – Label Top

The ^LT command moves the entire label format a maximum of 120 dot rows up or down from its current position, in relation to the top edge of the label. A negative value moves the format towards the top of the label; a positive value moves the format away from the top of the label.

This command can be used to fine-tune the position of the finished label without having to change any of the existing parameters.

**Important** • For some printer models, it is possible to request a negative value large enough to cause the media to backup into the printer and become unthreaded from the platen. This condition can result in a printer error or unpredictable results.

**Format:** ^LTx

| Parameters                  | Details                                                                                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x = label top (in dot rows) | <b>Values:</b><br>HC100: 0 to 120<br>XIIIIPlus 600dpi: -240 to 240<br>All other Zebra printers: -120 to 120<br><b>Default:</b> a value must be specified or the command is ignored |

**Comments** The Accepted Value range for x might be smaller depending on the printer platform.

The Label Top value shown on the front panel of the printer is double the value used in the ZPL format.

The ^LT command does not change the media rest position.

## ^MA – Set Maintenance Alerts

**.151**

This command is available only for printers with firmware version V60.15.x, V50.15.x, or later.

The ^MA command controls how the printer issues printed maintenance alerts. Maintenance alerts are labels that print with a warning that indicates the printhead needs to be cleaned or changed.

### Supported Devices

- Xi4, RXi4
- ZM400/ZM600, RZ400/RZ600
- S4M with v53.15.5Z or later
- G-Series

**Important** • ^MA settings do not impact or effect the functionality of the Xi4 Supplies Warning system.

**Format:** ^MA`type,print,printlabel_threshold,frequency,units`

| Parameters                                                                | Details                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>type</code> = type of alert                                         | <p><b>Values:</b></p> <p>R = head replacement<br/>C = head cleaning</p> <p><b>Default:</b> This parameter must be specified as R or C for <code>print</code>, <code>printlabel_threshold</code>, and <code>frequency</code> to be saved. However, <code>units</code> will always be set.</p>                                         |
| <code>print</code> = determines if the alert prints a label               | <p><b>Values:</b></p> <p>Y = print a label<br/>N = do not print label</p> <p><b>Default:</b> N</p>                                                                                                                                                                                                                                   |
| <code>printlabel_threshold</code> = distance where the first alert occurs | <p><b>Values:</b></p> <p>R = head replacement (unit of measurement for head is km with a range of 0 to 150 km)<br/>C = clean head with a range of 100 to 2000 meters.<br/>0 = off (when set to 0, the selected alert is disabled; otherwise it is enabled).</p> <p><b>Default:</b> R = 50 km (1,968,500 inches) and C = 0 (off).</p> |
| <code>frequency</code> = distance before reissuing the alert              | <p>The unit of measurement is in meters. The range is 0 to 2000. The range for G-Series printers is 0 or 5 to 2000 meters. When set to 0, the alert label is only printed on power-up or when the printer is reset.</p> <p><b>Default:</b> 0 (print on power-up).</p>                                                                |

| Parameters                                                 | Details                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>units</b> = odometer and printhead maintenance commands | The units parameter reports units of the odometer and printhead maintenance commands, as follows: ~HQOD, ~HQPH, ~WQOD, ~WQPH.<br><b>Values:</b><br>C = centimeters (displays as: cm)<br>I = inches (displays as: ")<br>M = meters (displays as: M)<br><b>Default:</b> I |

→ **Example:** This example sets the printed head cleaning message to print after five meters and to repeat every one meter after that until a ~ROC command is issued.

The Early Warning Maintenance setting must be ON. To enable the maintenance alert system on the G-Series™ printer the ^JH command is used; on other Zebra printers the front panel can also be used.

1. To set ^MA to print out a label flagging the need to clean the head, type:

`^XA^MAC,Y,5,1^XZ`

When the threshold is met a label will print indicating that the head needs to be clean.

2. For this example, the message on the label looks like this:

PLEASE CLEAN PRINT HEAD

For details resetting the units of measure, see the ~HQ examples on [page 222](#).

**Comments** Any values outside the specified range are ignored.

The intent of this command is to cause a label to print when the defined threshold is reached.

## ^MC – Map Clear

In normal operation, the bitmap is cleared after the format has been printed. The ^MC command is used to retain the current bitmap. This applies to current and subsequent labels until cleared with ^MCY.

**Format:** ^MCa

**Important** • To produce a label template, ^MC must be used with ^FV.

| Parameters    | Details                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------|
| a = map clear | <b>Values:</b> Y (clear bitmap) or N (do not clear bitmap)<br><b>Initial Value at Power Up:</b> Y |

**Comments** The ^MC command retains the image of the current label after formatting. It appears in the background of the next label printed.

## ^MD – Media Darkness

The ^MD command adjusts the darkness relative to the current darkness setting.

**Format:** ^MDa

| Parameters               | Details                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| a = media darkness level | <b>Values:</b> -30 to 30, depending on current value<br><b>Initial Value at Power Up:</b> 0<br>If no value is entered, this command is ignored. |

**Example 1:** These examples show setting the printer to different darkness levels:

- If the current value (value on configuration label) is 16, entering the command ^MD-9 decreases the value to 7.
- If the current value (value on configuration label) is 1, entering the command ^MD15 increases the value to 16.
- If the current value (value on configuration label) is 25, entering the command ^MD10 increases only the value to 30, which is the maximum value allowed.

Each ^MD command is treated separately in relation to the current value as printed on the configuration label.

**Note** • On Zebra G-Series™ printers the value set with the ^MD command is persistent across power cycles.

**Important** • The darkness setting range for the *XIIIPlus*, Xi4, and RXi4 is 0 to 30 in increments of 0.1.

The firmware is setup so that the ^MD and ~SD commands (ZPL darkness commands) accepts that range of settings.

**Example 2:** These are examples of the *XIIIPlus*, Xi4, and RXi4 Darkness Setting:

**^MD8.3**

**~SD8.3**

**Example 3:** For example, this is what would happen if two ^MD commands were received:

Assume the current value is 15. An ^MD-6 command is received that changes the current value to 9. Another command, ^MD2, is received. The current value changes to 17.

The two ^MD commands are treated individually in relation to the current value of 15.

**Comments** The ~SD command value, if applicable, is added to the ^MD command.

## ^MF – Media Feed

The ^MF command dictates what happens to the media at power-up and at head-close after the error clears.

**Format:** ^MFp,h

| Parameters                              | Details                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p = feed action at power-up             | <p><b>Values:</b> Accepted Values:</p> <ul style="list-style-type: none"> <li>F = feed to the first web after sensor</li> <li>C = (see <a href="#">^JC on page 247</a> definition)</li> <li>L = (see <a href="#">^JL on page 260</a> definition)</li> <li>N = no media feed</li> <li>S = short calibration <sup>m</sup></li> </ul> <p><b>Default:</b> C</p> |
| h = feed action after closing printhead | <p><b>Values:</b> Accepted Values:</p> <ul style="list-style-type: none"> <li>F = feed to the first web after sensor</li> <li>C = (see <a href="#">^JC on page 247</a> definition)</li> <li>L = (see <a href="#">^JL on page 260</a> definition)</li> <li>N = no media feed</li> <li>S = short calibration <sup>m</sup></li> </ul> <p><b>Default:</b> C</p> |

**m.** These values are supported only on Xi4, RXi4, *XilllPlus*, PAX, ZM400/ZM600, RZ400/RZ600, and S4M printers.

**Comments** It is important to remember that if you choose the N setting, the printer assumes that the media and its position relative to the printhead are the same as before power was turned off or the printhead was opened. Use the ^JU command to save changes.

## ^MI – Set Maintenance Information Message

**.151**

This command is available only for printers with firmware version V60.15.x, V50.15.x, or later.

The ^MI command controls the content of maintenance alert messages, which are reminders printed by the printer to instruct the operator to clean or replace the printhead.

### Supported Devices

- Xi4, RXi4
- ZM400/ZM600m RZ400/RZ600
- S4M with v53.15.5Z or later
- G-Series

**Format:** ^MItYPE,message

| Parameters                                                                        | Details                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>type</b> = identifies the type of alert                                        | <b>Values:</b><br>R = head replacement<br>C = head cleaning<br><b>Default:</b> R                                                                                                                                                                                                                                                      |
| <b>message</b> = message that prints on the label when a maintenance alert occurs | The maximum length of each message is 63 characters. All characters following the comma and preceding the next tilde (~) or carat (^) define the message string. Commas (,) are not allowed in the message.<br><b>Default:</b><br><b>HEAD CLEANING</b> = please clean printhead<br><b>HEAD REPLACEMENT</b> = please replace printhead |

**Example:** This example sets the printhead (head) replacement warning message. Printing of this message is controlled by the ^MA command.

1. To customize the text of this label, type something like this:  
`^XA^MIR,PRINT HEAD NEEDS REPLACEMENT - CALL EXT 1000^XZ`  
 The label prints whatever you program it to say.
2. For this example, the message on the label looks like this:

PRINT HEAD NEEDS REPLACEMENT - CALL  
EXT 1000

## ^ML – Maximum Label Length

The ^ML command lets you adjust the maximum label length.

**Note** • This command does not apply when in continuous mode.

**Format:** ^MLa

| Parameters                                | Details                                                                                                                                    |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| a = maximum label length<br>(in dot rows) | <b>Values:</b> the dpi of the printer multiplied by two, up to the maximum length of label<br><b>Default:</b> last permanently saved value |

**Comments** For calibration to work properly, you must set the maximum label length equal to or greater than your actual label length.

This command is ignored on the HC100™ printer

## ^MM – Print Mode

The ^MM command determines the action the printer takes after a label or group of labels has printed.

**Note** • Refer to the User Guide for your printer to determine which print modes are supported by your printer.

**Format:** ^M<sub>a</sub>M<sub>b</sub>

| Parameters                | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a =</b> desired mode   | <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>T = Tear-off <sup>n</sup></li> <li>P = Peel-off (not available on S-300) <sup>n</sup></li> <li>R = Rewind (depends on printer model)</li> <li>A = Applicator (depends on printer model) <sup>n</sup></li> <li>C = Cutter (depends on printer model)</li> <li>D = Delayed cutter <sup>n</sup></li> <li>F = RFID <sup>n</sup></li> <li>L = Reserved <sup>n, o</sup></li> <li>U = Reserved <sup>n, o</sup></li> <li>K = Kiosk <sup>p</sup></li> </ul> <p><b>Default:</b></p> <p>The values available for parameter <b>a</b> depend on the printer being used and whether it supports the option.</p> <p>For RFID printers:</p> <ul style="list-style-type: none"> <li>A = R110PAX4 print engines</li> <li>F = other RFID printers</li> </ul> |

The current value of the command remains unchanged.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**n.** This value is not supported on the KR403 or ZD500R printer.

**o.** This value is supported only on the ZM400 and ZM600 printers.

**p.** This value is supported only the KR403 printer.

This list identifies the different modes of operation:

- Tear-off — after printing, the label advances so the web is over the tear bar. The label, with liner attached, can be torn off manually.

- **Peel-off** — after printing, the label moves forward and activates a Label Available Sensor. Printing stops until the label is manually removed from the printer.  
*Power Peel* – liner automatically rewinds using an optional internal rewind spindle.  
*Value Peel* – liner feeds down the front of the printer and is manually removed.  
*Prepeel* – after each label is manually removed, the printer feeds the next label forward to prepeel a small portion of the label away from the liner material. The printer then backfeeds and prints the label. The prepeel feature assists in the proper peel operation of some media types.
- **Rewind** — the label and liner are rewound on an (optional) external rewind device. The next label is positioned under the printhead (no backfeed motion).
- **Applicator** — when used with an application device, the label move far enough forward to be removed by the applicator and applied to an item. This applies only to printers that have applicator ports and that are being used in a print-and-apply system.
- **Cutter** — after printing, the media feeds forward and is automatically cut into predetermined lengths.
- **Delayed cutter** — When the printer is in the Delayed Cut PRINT MODE, it will cut the label when it receives the **~JK** (Delayed Cut) command. To activate the **~JK** command, the printer's PRINT MODE must be set to Delayed Cut and there must be a label waiting to be cut. When the printer is not in the Delayed Cut PRINT MODE, the printer will not cut the label when it receives the **~JK** command.

**Note** • Send **~JK** in a separate file - it cannot be sent at the end of a set of commands.

The Delayed Cut feature can be activated:

- through PRINT MODE on the printer's control panel
- with a **^MMD** command
- RFID — increases throughput time when printing batches of RFID labels by eliminating backfeed between labels.
- Kiosk — after printing, the media is moved in a presentation position, most applications maintain a loop of media in the printer.

**Comments** Be sure to select the appropriate value for the print mode being used to avoid unexpected results.

This command is ignored on the HC100™ printer.

## ^MN – Media Tracking

This command specifies the media type being used and the black mark offset in dots.

This bulleted list shows the types of media associated with this command:

- Continuous Media – this media has no physical characteristic (such as a web, notch, perforation, black mark) to separate labels. Label length is determined by the ^LL command.
- Continuous Media, variable length – same as Continuous Media, but if portions of the printed label fall outside of the defined label length, the label size will automatically be extended to contain them. This label length extension applies only to the current label. Note that ^MNV still requires the use of the ^LL command to define the initial desired label length.
- Non-continuous Media – this media has some type of physical characteristic (such as web, notch, perforation, black mark) to separate the labels.

**Format:** ^MNa,b

| Parameters                    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| b = black mark offset in dots | <p>This sets the expected location of the media mark relative to the point of separation between documents. If set to 0, the media mark is expected to be found at the point of separation. (i.e., the perforation, cut point, etc.) All values are listed in dots. This parameter is ignored unless the a parameter is set to M. If this parameter is missing, the default value is used.</p> <p><b>Values: Accepted Values:</b></p> <ul style="list-style-type: none"> <li>-80 to 283 for direct-thermal only printers</li> <li>-240 to 566 for 600 dpi printers</li> <li>-75 to 283 for KR403 printers</li> <li>-120 to 283 for all other printers</li> </ul> <p><b>Default:</b> 0</p> |

- <sup>q.</sup> Provides the same result.
- <sup>r.</sup> This value is not supported on the KR403 printer.
- <sup>s.</sup> This parameter is supported only on G-series printers.
- <sup>t.</sup> This parameter is supported only on the KR403 printer.

**Comments** This command is ignored on the HC100™ printer.

## ^MP – Mode Protection

The ^MP command is used to disable the various mode functions on the control panel. Once disabled, the settings for the particular mode function can no longer be changed and the LED associated with the function does not light.

Because this command has only one parameter, each mode must be disabled with an individual ^MP command.

**Format:** ^MPa

| Parameters          | Details                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = mode to protect | <p><b>Values:</b> Accepted Values:</p> <p>D = disable Darkness Mode<br/>P = disable Position Mode<br/>C = disable Calibration Mode<br/>E = enable all modes<br/>S = disable all mode saves (modes can be adjusted but values are not saved)<br/>W = disable Pause<br/>F = disable Feed<br/>X = disable Cancel<br/>M = disable menu changes</p> <p><b>Default:</b> a value must be entered or the command is ignored</p> |

→ **Example:** This example shows the ZPL code that disables modes D and C. It also shows the effects on the configuration label before and after the ZPL code is sent:

```
^XA
^MPD
^MPC
^XZ
```

## ^MT – Media Type

The ^MT command selects the type of media being used in the printer.

These are the choices for this command:

- Thermal Transfer Media – this media uses a high-carbon black or colored ribbon. The ink on the ribbon is bonded to the media.
- Direct Thermal Media – this media is heat sensitive and requires no ribbon.

**Format:** ^MTa

| Parameters          | Details                                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = media type used | <b>Values:</b> Accepted Values:<br>T = thermal transfer media<br>D = direct thermal media<br><b>Default:</b> a value must be entered or the command is ignored |

**Comments** This command is ignored on the HC100™ printer.

## ^MU – Set Units of Measurement

The ^MU command sets the units of measurement the printer uses. ^MU works on a field-by-field basis. Once the mode of units is set, it carries over from field to field until a new mode of units is entered.

^MU also allows for printing at lower resolutions — 600 dpi printers are capable of printing at 300, 200, and 150 dpi; 300 dpi printers are capable of printing at 150 dpi.

**Format:** ^M**U**a,b,c

| Parameters                                  | Details                                                                                               |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>a</b> = units                            | <b>Values:</b><br><b>D</b> = dots<br><b>I</b> = inches<br><b>M</b> = millimeters<br><b>Default:</b> D |
| <b>b</b> = format base in dots per inch     | <b>Values:</b> 150, 200, 300<br><b>Default:</b> a value must be entered or the command is ignored     |
| <b>c</b> = desired dots-per-inch conversion | <b>Values:</b> 300, 600<br><b>Default:</b> a value must be entered or the command is ignored          |

→ **Example 1:** This is an example of Setting Units:

Assume 8 dot/millimeter (203 dot/inch) printer.

*Field based on dots:*

**^MUD^F0100,100^GB1024,128,128^FS**

*Field based on millimeters:*

**^MUM^F012.5,12.5^GB128,16,16^FS**

*Field based on inches:*

**^MUI^F0.493,.493^GB5.044,.631,.631^FS**

→ **Example 2:** This is an example of Converting dpi Values.

*Convert a 150 dpi format to a 300 dpi format with a base in dots:*

**^MUD,150,300**

*Convert a 150 dpi format to a 600 dpi format with a base in dots:*

**^MUD,150,600**

*Convert a 200 dpi format to a 600 dpi format with a base in dots:*

**^MUD,200,600**

*To reset the conversion factor to the original format, enter matching values for parameters **b** and **c**:*

**^MUD,150,150**

**^MUD,200,200**

**^MUD,300,300**

**^MUD,600,600**

**Comments** This command should appear at the beginning of the label format to be in proper ZPL II format. To turn the conversion off, enter matching values for parameter **b** and **c**.

## ^MW – Modify Head Cold Warning

The ^MW command allows you to set the head cold warning indicator based on the operating environment.

**Format:** ^MWa

| Parameters                   | Details                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------|
| a = enable head cold warning | <i>Accepted Values:</i><br>Y = enable head cold warning<br>N = disable head cold warning |

**Important** • When a parameter is **not** given, the instruction is *ignored*.

## ^NC – Select the Primary Network Device

The ^NC command selects the wired or wireless print server as the primary network device.

### Supported Devices

- Xi4, RXi4
- ZM400/ZM600, RZ400/RZ600

The Xi4, RXi4, ZM400/ZM600, and RZ400/RZ600 printers support the simultaneous installation of an internal, external, and a wireless print server. Even though all three print servers may be installed, only one is connected to the network and is the active print server. Table 16 outlines priorities and identifies which device becomes the active print server when multiple print servers are installed.

**Table 16 • Effect of Primary Network Setting on Active Print Server**

| If the Primary Network is set to: | Installed and Connected to a Live Ethernet Network |          |                       | Then, the Active Print Server will be: |
|-----------------------------------|----------------------------------------------------|----------|-----------------------|----------------------------------------|
|                                   | Internal                                           | External | Wireless <sup>u</sup> |                                        |
| Wired                             | X                                                  | X        | X                     | Internal                               |
|                                   |                                                    | X        | X                     | External                               |
|                                   |                                                    |          | X                     | Wireless                               |
| Wireless                          | X                                                  | X        | X                     | Wireless                               |
|                                   | X                                                  | X        |                       | Internal                               |
|                                   |                                                    | X        |                       | External                               |

**u.** A wireless option board must have an active radio that can properly associate to an access point.

**Format:** ^NCa

| Parameters                 | Details                                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| a = primary network device | <b>Values:</b><br>1 = wired primary<br>2 = wireless primary<br><b>Default: 1</b><br>must be an accepted value or it is ignored |

## ~NC – Network Connect

The ~NC command is used to connect a particular printer to a network by calling up the printer's network ID number.

**Format:** ~NC###

| Parameters                                                     | Details                                                 |
|----------------------------------------------------------------|---------------------------------------------------------|
| ### = network ID number assigned (must be a three-digit entry) | <b>Values:</b> 001 to 999<br><b>Default:</b> 000 (none) |

**Comments** Use this command at the beginning of any label format to specify which printer on the network is going to be used. Once the printer is established, it continues to be used until it is changed by another ~NC command. This command must be included in the label format to *wake up the printer*.

The commands ^MW, ~NC, ^NI, ~NR, and ~NT are used only with RS-422/485 printer communications.

## ^ND – Change Network Settings

The ^ND command changes the network settings on supported printers.

For the external wired print server settings, the ^ND command is the same as the ^NS command. For the wireless print server settings, the ^ND command is the same as the ^WI command.

### Supported Devices

- Xi4 with firmware V53.17.1Z or later
- RXi4
- RZ400/RZ600 with firmware R53.15.xZ or later
- ZM400/ZM600 with firmware V53.15.xZ or later
- G-Series

**Format:** ^NDa,b,c,d,e,f,g,h,i,j

| Parameters                            | Details                                                                                                                                                                                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = the device that is being modified | <b>Values:</b><br>1 = external wired<br>2 = internal wired<br>3 = wireless                                                                                                                                                                       |
| b = IP resolution                     | <b>Values:</b><br>A = All<br>B = BOOTP<br>C = DHCP and BOOTP<br>D = DHCP<br>G = Gleaning only (Not recommended when the Wireless Print Server or Wireless Plus Print Server is installed.)<br>R = RARP<br>P = Permanent<br><br><b>Default:</b> A |
| c = IP address                        | <b>Values:</b> Any properly formatted IP address in the xxx.xxx.xxx.xxx format.                                                                                                                                                                  |
| d = subnet mask                       | <b>Values:</b> Any properly formatted subnet mask in the xxx.xxx.xxx.xxx format.                                                                                                                                                                 |
| e = default gateway                   | <b>Values:</b> Any properly formatted gateway in the xxx.xxx.xxx.xxx format.                                                                                                                                                                     |
| f = WINS server address               | <b>Values:</b> Any properly formatted WINS server in the xxx.xxx.xxx.xxx format.                                                                                                                                                                 |
| g = connection timeout checking       | <b>Values:</b><br>Y = yes<br>N = no<br><br><b>Default:</b> Y                                                                                                                                                                                     |

| Parameters                        | Details                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>h</b> = timeout value          | Time, in seconds, before the connection times out.<br><b>Values:</b> 0 through 9999<br><b>Default:</b> 300                                       |
| <b>i</b> = ARP broadcast interval | Time, in minutes, that the broadcast is sent to update the device's ARP cache.<br><b>Values:</b> 0 through 30<br><b>Default:</b> 0 (no ARP sent) |
| <b>j</b> = base raw port number   | The port number that the printer should use for its RAW data.<br><b>Values:</b> 1 through 65535<br><b>Default:</b> 9100                          |

## ^NI – Network ID Number

The ^NI command is used to assign a network ID number to the printer. This must be done before the printer can be used in a network.

**Format:** ^NI###

| Parameters                                                     | Details                                                 |
|----------------------------------------------------------------|---------------------------------------------------------|
| ### = network ID number assigned (must be a three-digit entry) | <b>Values:</b> 001 to 999<br><b>Default:</b> 000 (none) |

**Comments** The last network ID number set is the one recognized by the system.

The commands ~NC, ^NI, ~NR, and ~NT are used only with RS-485 printer communications.

## ~NR – Set All Network Printers Transparent

The ~NR command sets all printers in the network to be transparent, regardless of ID or current mode.

**Format:** ~NR

**Comments** The commands ~NC, ^NI, ~NR, and ~NT are used only with RS-485 printer communications.

## ^NS – Change Wired Networking Settings

Use this command to change the wired print server network settings.

**Format:** ^NSa,b,c,d,e,f,g,h,i

| Parameters                      | Details                                                                                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = IP resolution               | <b>Values:</b><br>A = ALL<br>B = BOOTP<br>C = DHCP AND BOOTP<br>D = DHCP<br>G = GLEANING ONLY<br>R = RARP<br>P = PERMANENT<br><b>Default:</b> A<br>Use of GLEANING ONLY is not recommended when the Wireless Print Server or Wireless Plus Print Server is installed. |
| b = IP address                  | <b>Values:</b> Any properly formatted IP address in the xxx.xxx.xxx.xxx format.                                                                                                                                                                                       |
| c = subnet mask                 | <b>Values:</b> Any properly formatted subnet mask in the xxx.xxx.xxx.xxx format.                                                                                                                                                                                      |
| d = default gateway             | <b>Values:</b> Any properly formatted gateway in the xxx.xxx.xxx.xxx format.                                                                                                                                                                                          |
| e = WINS server address         | <b>Values:</b> Any properly formatted WINS server in the xxx.xxx.xxx.xxx format.                                                                                                                                                                                      |
| f = connection timeout checking | <b>Values:</b><br>Y = Yes<br>N = No<br><b>Default:</b> Y                                                                                                                                                                                                              |
| g = timeout value               | Time, in seconds, before the connection times out.<br><b>Values:</b> 0 through 9999<br><b>Default:</b> 300                                                                                                                                                            |
| h = ARP broadcast interval      | Time, in minutes, that the broadcast is sent to update the device's ARP cache.<br><b>Values:</b> 0 through 30<br><b>Default:</b> 0 (no ARP sent)                                                                                                                      |
| i = base raw port number        | The port number that the printer should use for its RAW data.<br><b>Values:</b> 1 through 65535<br><b>Default:</b> 9100                                                                                                                                               |

### Example:

```
^XA
^NSa,192.168.0.1,255.255.255.0,192.168.0.2
^XZ
```

**Comments** For the Xi4, RXI4, ZM400/ZM600, and RZ400/RZ600 printers, Zebra recommends that you use the ^ND command instead of the ^NS command.

## ~NT – Set Currently Connected Printer Transparent

The ~NT command sets the currently connected network printer to be transparent.

**Format:** ~NT

**Comments** With Z Series® printers, the ~NT command functions the same as the ~NR command. All Z Series printers on a network receive the transmission.

The commands ~NC, ^NI, ~NR, and ~NT are used only with RS-485 printer communications.

## ^PA – Advanced Text Properties

.14↑

This command is available only for printers with firmware version V60.14.x, V50.14.x, or later.

The ^PA command is used to configure advanced text layout features.

**Format:** ^PAA,**a,b,c,d**

| Parameters                           | Details                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b> = default glyph             | <p>This determines whether the default glyph is a space character or the default glyph of the base font, which is typically a hollow box.</p> <p><b>Values:</b></p> <p><b>0</b> = off (space as default glyph)<br/><b>1</b> = on (default glyph of font is used, often a hollow box, but depends on the font.)</p> <p><b>Default:</b> 0</p> |
| <b>b</b> = bidirectional text layout | <p>This determines whether the bidirectional text layout is turned on or off.</p> <p><b>Values:</b></p> <p><b>0</b> = off<br/><b>1</b> = on</p> <p><b>Default:</b> 0</p>                                                                                                                                                                    |
| <b>c</b> = character shaping         | <p>This determines whether character shaping is turned on or off.</p> <p><b>Values:</b></p> <p><b>0</b> = off<br/><b>1</b> = on</p> <p><b>Default:</b> 0</p>                                                                                                                                                                                |
| <b>d</b> = OpenType table support    | <p>This determines whether the OpenType support is turned on or off.</p> <p><b>Values:</b></p> <p><b>0</b> = off<br/><b>1</b> = on</p> <p><b>Default:</b> 0</p>                                                                                                                                                                             |

## ^PF – Slew Given Number of Dot Rows

The ^PF command causes the printer to slew labels (move labels at a high speed without printing) a specified number of dot rows from the bottom of the label. This allows faster printing when the bottom portion of a label is blank.

**Format:** ^PF#

| Parameters                      | Details                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------|
| # = number of dots rows to slew | <b>Values:</b> 0 to 32000<br><b>Default:</b> a value must be entered or the command is ignored |

## ^PH ~PH – Slew to Home Position

The ^PH or ~PH command causes the printer to feed one blank label.

The ~PH command feeds one label after the format currently being printed is done or when the printer is placed in pause.

The ^PH command feeds one blank label after the current format prints.

**Format:** ^PH or ~PH

## ~PL – Present Length Addition

The ~PL command adds an additional amount to how far the paper is ejected during a present cycle. A standard amount of 50mm is always added to clear the kiosk wall. This amount is added to that 50mm. The total amount of media ejected when a ^PN is executed, then, is 50mm + ~PL value + ^PN value.

### Supported Devices

- KR403

**Format:** ^PLa

| Parameters                  | Details                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| a = additional eject length | <b>Values:</b><br>000–255 = additional mm of media to eject<br><b>Default:</b> 000<br>The command is ignored if parameters are missing or invalid. |

## ^PM – Printing Mirror Image of Label

The ^PM command prints the entire printable area of the label as a mirror image. This command flips the image from left to right.

**Format:** ^P<sub>M</sub>a

| Parameters                             | Details                                                  |
|----------------------------------------|----------------------------------------------------------|
| a = print mirror image of entire label | <b>Values:</b><br>N = no<br>Y = yes<br><b>Default:</b> N |

**Example:** This is an example of printing a mirror image on a label:

| ZPL II CODE                                                                | GENERATED LABEL                                                                     |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <pre>^XA^PMY ^FO100,100 ^CFG ^FDMIRROR^FS ^FO100,160 ^FDIMAGE^FS ^XZ</pre> |  |

**Comments** If the parameter is missing or invalid, the command is ignored. Once entered, the ^PM command remains active until ^PMN is received or the printer is turned off.

## ^PN – Present Now

The ^PN command causes the printer to run a Presenter cycle. The parameter defines the amount of media ejected. The total amount of media ejected when a ^PN is executed, then, is 50mm + ~PL value + ^PN value. (See [~PL on page 316](#)).

### Supported Devices

- KR403

**Format:** ^PNa

| Parameters             | Details                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| a = media eject length | <b>Values:</b><br>0–255 = additional mm of media to eject<br><b>Default:</b> none<br>The command is ignored if parameters are missing or invalid. |

## ^PO – Print Orientation

The ^PO command inverts the label format 180 degrees. The label appears to be printed upside down. If the original label contains commands such as ^LL, ^LS, ^LT and ^PF, the inverted label output is affected differently.

**Format:** ^POa

| Parameters                      | Details                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------|
| a = invert label<br>180 degrees | <p><i>Accepted Values:</i></p> <p>N = normal<br/>I = invert</p> <p><b>Default:</b> N</p> |

→ **Example:** This is an example of printing a label at 180 degrees:

| ZPL II CODE                                                                                             | GENERATED LABEL                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>^XA^CFD ^POI ^LH330,10 ^FO50,50 ^FDZEBRA TECHNOLOGIES^FS ^FO50,75 ^FDVernon Hills, IL^FS ^XZ</pre> | <p>The generated label shows the text "ZEBRA TECHNOLOGIES" at the top and "Vernon Hills, IL" at the bottom, both displayed upside down due to the ^POI command.</p> |

The ^POI command inverts the x, y coordinates. All image placement is relative to these inverted coordinates. Therefore, a different ^LH (Label Home) can be used to move the print back onto the label.

**Comments** If multiple ^PO commands are issued in the same label format, only the last command sent to the printer is used.

Once the ^PO command is sent, the setting is retained until another ^PO command is received or the printer is turned off.

The N value for the a parameter is not supported on the HC100™ printer.

## **^PP ~PP – Programmable Pause**

The ~PP command stops printing after the current label is complete (if one is printing) and places the printer in Pause Mode.

The ^PP command is not immediate. Therefore, several labels might print before a pause is performed. This command pauses the printer after the current format prints.

The operation is identical to pressing PAUSE on the control panel of the printer. The printer remains paused until PAUSE is pressed or a ~PS (Print Start) command is sent to the printer.

**Format:** ^PP or ~PP

## ^PQ – Print Quantity

The ^PQ command gives control over several printing operations. It controls the number of labels to print, the number of labels printed before printer pauses, and the number of replications of each serial number.

**Format:** ^PQ<sub>q</sub>,<sub>p</sub>,<sub>r</sub>,<sub>o</sub>,<sub>e</sub>

| Parameters                                                  | Details                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>q</b> = total quantity of labels to print                | <b>Values:</b> 1 to 99,999,999<br><b>Default:</b> 1                                                                                                                                                                                                                                               |
| <b>p</b> = pause and cut value (labels between pauses)      | <b>Values:</b> 1 to 99,999,999<br><b>Default:</b> 0 (no pause)                                                                                                                                                                                                                                    |
| <b>r</b> = replicates of each serial number                 | <b>Values:</b> 0 to 99,999,999 replicates<br><b>Default:</b> :0 (no replicates)                                                                                                                                                                                                                   |
| <b>o</b> = override pause count                             | <b>Values:</b><br>N = no<br>Y = yes<br><b>Default:</b> N                                                                                                                                                                                                                                          |
| <b>e</b> = cut on error label (RFID void is an error label) | <b>Values:</b><br>N = no - if a cutter is installed, a cut will be made after a voided RFID label ONLY if a cut would be made after the non-voided label and this was the last retry.<br>Y = yes - if a cutter is installed, a cut will be made after ANY voided RFID label.<br><b>Default:</b> Y |

If the **o** parameter is set to **Y**, the printer cuts but does not pause, and the printer does **not** pause after every group count of labels has been printed. With the **o** parameter set to **N** (default), the printer pauses after every group count of labels has been printed.

**Example:** This example shows the control over print operations:

**^PQ50,10,1,Y:** This example prints a total of 50 labels with one replicate of each serial number. It prints the total quantity in groups of 10, but does not pause after every group.

**^PQ50,10,1,N:** This example prints a total of 50 labels with one replicate of each serial number. It prints the total quantity in groups of 10, pausing after every group.

## ~PR – Applicator Reprint

If the ~PR command is enabled (see [^JJ on page 258](#)), the last label printed reprints, similar to the applicator asserting the Reprint signal on the applicator port. This command is similar to [device.applicator.reprint on page 667](#).

### Supported Devices

- ZE500
- *XIIIPlus*
- Xi4 with firmware V53.17.1Z or later
- *PAX2, PAX4*
- S4M
- ZM400/ZM600

**Format:** ~PR

**Comments** Pressing PREVIOUS on the control panel also causes the last label to reprint.

## ^PR – Print Rate

The ^PR command determines the media and slew speed (feeding a blank label) during printing.

The printer operates with the selected speeds until the setting is reissued or the printer is turned off.

The print speed is application-specific. Because print quality is affected by media, ribbon, printing speeds, and printer operating modes, it is very important to run tests for your applications.

**Important** • Some models go to default print speed when power is turned off.

**Format:** ^PRp,s,b

| Parameters      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p = print speed | <p><i>Accepted Values:</i></p> <p>1 = 25.4 mm/sec. (1 inch/sec.)<sup>v</sup><br/>     A or 2 = 50.8 mm/sec. (2 inches/sec.)<br/>     B or 3 = 76.2 mm/sec. (3 inches/sec.)<br/>     C or 4 = 101.6 mm/sec. (4 inches/sec.)<br/>     5 = 127 mm/sec.(5 inches/sec.)<br/>     D or 6 = 152.4 mm/sec. (6 inches/sec.)<br/>     7 = 177.8 mm/sec. (10 inches/sec.)<br/>     11 = 269.5 mm/sec. 11 inches/sec.)<br/>     12 = 304.8 mm/sec. 12 inches/sec.)<br/>     13 = 13 in/sec <sup>w</sup><br/>     14 = 14 in/sec <sup>w</sup></p> <p><b>Default: D</b></p> |
| <b>b</b> = backfeed speed | <p><b>Values:</b></p> <p>A or 2 = 50.8 mm/sec. (2 inches/sec.)<br/>     B or 3 = 76.2 mm/sec. (3 inches/sec.)<br/>     C or 4 = 101.6 mm/sec. (4 inches/sec.)<br/>     5 = 127 mm/sec.(5 inches/sec.)<br/>     D or 6 = 152.4 mm/sec. (6 inches/sec.)<br/>     7 = 177.8 mm/sec. (7 inches/sec.)<br/>     E or 8 = 203.2 mm/sec. (8 inches/sec.)<br/>     9 = 220.5 mm/sec. 9 inches/sec.)<br/>     10 = 245 mm/sec. 10 inches/sec.)<br/>     11 = 269.5 mm/sec. 11 inches/sec.)<br/>     12 = 304.8 mm/sec. 12 inches/sec.)<br/>     13 = 13 in/sec <sup>w</sup><br/>     14 = 14 in/sec <sup>w</sup></p> <p><b>Default: A</b></p>   |

**v.** This value is supported only on the 110Xi4-600dpi, 110XiIIIPlus-600dpi , and RXi printers.

**w.** This value is supported only on the Xi4 and RXi4 printers.

**Comments** The speed setting for **p**, **s**, and **b** is dependent on the limitations of the printer. If a particular printer is limited to a rate of 6 ips (inches per second), a value of 12 can be entered but the printer performs only at a 6 ips rate. See your printer's User Guide for specifics on performance.

This command is ignored on the HC100 printer.

## ~PS – Print Start

The ~PS command causes a printer in Pause Mode to resume printing. The operation is identical to pressing PAUSE on the control panel of the printer when the printer is already in Pause Mode.

**Format:** ~PS

## ^PW – Print Width

The ^PW command allows you to set the print width.

**Format:** ^PWA

| Parameters                | Details                                                                                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = label width (in dots) | <b>Values:</b> 2, to the width of the label<br>If the value exceeds the width of the label, the width is set to the label's maximum size.<br><b>Default:</b> last permanently saved value |

**Comments** This command is ignored on the HC100™ printer.

## ~RO – Reset Advanced Counters

The ~RO command resets the advanced counters used by the printer to monitor label generation in inches, centimeters, and number of labels.

**Format:** ~ROc

| Parameters         | Details                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c = counter number | <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>1 = reset counter 1</li> <li>2 = reset counter 2</li> <li>3 = reset valid RFID label counter</li> <li>4 = reset voided RFID label counter</li> <li>C = reset head cleaned counter <sup>x</sup></li> <li>R = reset head replaced counter and head cleaned counter <sup>x</sup></li> </ul> <p><b>Default:</b> a value must be specified or the command is ignored</p> |

x. These values are supported only on Xi4, RXi4, ZM400/ZM600, RZ400/RZ600, S4M, and G-Series printers.

**Example 1:** This example shows how the counter portion of the printer configuration labels looks when counter 1 is reset by sending ~R01.

| <b>Before</b>                                                                                                                                                                                                                                                                        |

## ^SC – Set Serial Communications

The ^SC command allows you to change the serial communications parameters you are using.

**Format:** ^SCa,b,c,d,e,f

| Parameters                     | Details                                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = baud rate                  | <b>Values:</b> 110 <sup>y</sup> ; 300; 600; 1200; 2400; 4800; 9600; 14400; 19200; 28800; 38400; or 57600; 115200<br><b>Default:</b> must be specified or the parameter is ignored |
| b = word length (in data bits) | <b>Values:</b> 7 or 8<br><b>Default:</b> must be specified                                                                                                                        |
| c = parity                     | <b>Values:</b> N (none), E (even), or O (odd)<br><b>Default:</b> must be specified                                                                                                |
| d = stop bits                  | <b>Values:</b> 1 or 2<br><b>Default:</b> must be specified                                                                                                                        |
| e = protocol mode              | <b>Values:</b><br>X = XON/XOFF<br>D = DTR/DSR<br>R = RTS<br>M = DTR/DSR XON/XOFF <sup>z</sup><br><b>Default:</b> must be specified                                                |
| f = Zebra protocol             | <b>Values:</b><br>A = ACK/NAK<br>N = none<br>Z = Zebra<br><b>Default:</b> must be specified                                                                                       |

**y.** This value is not supported on Xi4, RXi4, ZM400/ZM600, RZ400/RZ600, and S4M printers.

**z.** This parameter is supported only on G-Series printers. Using the DTR/DSR XON/XOFF mode will cause the printer to respond to either DTR/DSR or XON/XOFF, depending on which method is first received from the host device.

**Comments** If any of the parameters are missing, out of specification, not supported by a particular printer, or have a ZPL-override DIP switch set, the command is ignored.

A ^JUS command causes the changes in Communications Mode to persist through power-up and software resets.

## ~SD – Set Darkness

The ~SD command allows you to set the darkness of printing. ~SD is the equivalent of the darkness setting parameter on the control panel display.

**Format:** ~SD##

| Parameters                                       | Details                                                                 |
|--------------------------------------------------|-------------------------------------------------------------------------|
| ## = desired darkness setting (two-digit number) | <b>Values:</b> 00 to 30<br><b>Default:</b> last permanently saved value |

**Important** • The darkness setting range for the *XIIIPlus*, Xi4, and RXi4 is 0 to 30 in increments of 0.1. The firmware is setup so that the ^MD and ~SD commands (ZPL darkness commands) accept that range of settings.

**Example:** These are examples of the *XIIIPlus*, Xi4, and RXi4 Darkness Setting:

**^MD8.3**

**~SD8.3**

**Comments** The ^MD command value, if applicable, is added to the ~SD command.

## ^SE – Select Encoding Table

The ^SE command is used to select the desired ZPL or ZPL II encoding table.

**Format:** ^SEd:o.x

| Parameters                     | Details                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------|
| d = location of encoding table | <b>Values:</b> R:, E:, B:, and A:<br><b>Default:</b> R:                                                    |
| o = name of encoding table     | <b>Values:</b> Accepted Value: 1 to 8 alphanumeric characters<br><b>Default:</b> a value must be specified |
| x = extension                  | <b>Fixed Value:</b> .DAT                                                                                   |

The encoding tables are provided with the font card or downloaded in flash with the font. The table appears as XXXXXX.DAT in a directory label printed by the ZPL commands.

The most active encoding table is indicated by the \* on the directory label.

**Example:**

^XA^WD\*:\*.^XZ

## ^SF – Serialization Field (with a Standard ^FD String)

The ^SF command allows you to serialize a standard ^FD string. The maximum size of the mask and increment string is 3K combined.

.14↑

In firmware version x.14 and later, strings are serialized from the last character in the backing store with regard to the alignment of the mask and increment strings. For combining semantic clusters that do not get incremented, the mask character % needs to be added to the increment string.

**Format:** ^SFa,b

| Parameters                  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b> = mask string      | <p>The mask string sets the serialization scheme. The length of the string mask defines the number of characters (or in firmware version x.14 and later, combining semantic clusters) in the current ^FD string to be serialized. The mask is aligned to the characters (or in firmware version x.14 and later, combining semantic clusters) in the ^FD string starting with the right-most (or in firmware x.14 and later, last) in the backing store position.</p> <p><i>Mask String placeholders:</i></p> <ul style="list-style-type: none"> <li><b>D or d</b> – Decimal numeric 0–9</li> <li><b>H or h</b> – Hexadecimal 0–9 plus a-f or A-F</li> <li><b>O or o</b> – Octal 0–7</li> <li><b>A or a</b> – Alphabetic A–Z or a–z</li> <li><b>N or n</b> – Alphanumeric 0–9 plus A–Z or a–z</li> <li><b>%</b> – Ignore character or skip</li> </ul> |
| <b>b</b> = increment string | <p>The increment string is the value to be added to the field on each label. The default value is equivalent to a decimal value of one. The string is composed of any characters (or in firmware version x.14 and later, combining semantic clusters) defined in the serial string. Invalid characters (or in firmware version x.14 and later, combining semantic clusters) are assumed to be equal to a value of zero in that characters (or in firmware version x.14 and later, combining semantic clusters) position.</p> <p>The increment value for alphabetic strings start with ‘A’ or ‘a’ as the zero placeholder. This means to increment an alphabetic character (or in firmware version x.14 and later, combining semantic cluster) by one, a value of ‘B’ or ‘b’ must be in the increment string.</p>                                     |

For characters that do not get incremented, the % character needs to be added to the increment string.

**Example 1:** This is an example of serializing a ^FD string. The ZPL II code generates three separate labels as seen in Generated Labels:

| ZPL II CODE                                                                          | GENERATED LABELS |
|--------------------------------------------------------------------------------------|------------------|
| <code>^XA<br/>^FO100,100<br/>^CFO,100<br/>^FD12A^SFnnA, F^FS<br/>^PQ3<br/>^XZ</code> | <b>12K</b>       |
|                                                                                      | <b>12F</b>       |
|                                                                                      | <b>12A</b>       |

This mask has the first characters (or in firmware version x.14 and later, the first combining semantic clusters) as alphanumeric (**nn** = 12) and the last digit as uppercase alphabetic (A). The decimal value of the increment number is equivalent to 5 (F). The number of labels generated depends on the number specified by the ^PQ command.

In a similar instance, the ^FD string could be replaced with either of the ^FD strings below to generate a series of label, determined by ^PQ.

Using this ZPL code:

**^FDBL0000^SFAAdddd,1**

The print sequence on this series of labels is:

**BL0000, BL0001, ..., BL0009, BL0010, ...**

**BL0099, BL0100, ..., BL9999, BM0000...**

Using this ZPL code:

**^FDBL00-0^SFAAdd%d,1%1**

The print sequence on this series of labels is:

**BL00-0, BL01-1, BL02-2, ..., BL09-9,**

**BL11-0, BL12-1...**

.14↑

Important notes about masking for firmware version V60.14.x, V50.14.x, or later:

- A single % masks an entire combining semantic cluster rather than a single code point.
- The mask string and increment string should be aligned at the last code point in their respective backing stores.
- Control and bidirectional characters do not require a mask and are ignored for serialization purposes.

The following examples show the importance of capitalization and location within the mask.

**Example 2:** In this example, the printer cycles with every two printed labels and alternates between H (position 18), and then Z (position 36). With n or N, the serial number increments from 0 - 9 and a-z or A-Z (36 positions overall). With each completed cycle, the second cluster (nn) increments one position (from 00, 01, 02 ...) per cycle:

| ZPL II CODE                                                    | GENERATED LABELS                                                                                                                                                                                                                                       |     |     |     |     |     |     |     |     |     |    |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|

| zz                                                             |                                                                                                                                                                                                                                                        |     |     |     |     |     |     |     |     |     |    |

**Example 3:** In this example, lower case i increments with a mask string of nnN. Nothing changes because the first cluster (Z) never triggers the second cluster (zz) to change.

## ^SI – Set Sensor Intensity

.151

This command is available only for printers with firmware versions V53.15.x or later.

The ^SI command is used to change the values for the media sensors, which are also set during the media calibration process. The media calibration process is described in your specific printer's user's guide.

### Supported Devices

- Xi4 with firmware V53.17.1Z or later
- RXi4 with firmware V53.17.7Z or later
- ZM400/ZM600 with firmware V53.15.xZ or later
- RZ400/RZ600 with firmware R53.15.xZ or later

**Format:** ^SIA,b

## ^SL – Set Mode and Language (for Real-Time Clock)

The ^SL command is used to specify the Real-Time Clock's mode of operation and language for printing information.

### Important •

- Time is read when the image is created. If the image stays in the queue longer than the specified time the image will be recreated with a new time.
- There are incidents when the same time or a larger space of time may be printed on labels. This is due to the format complexity and print speed.

---

**Format:** ^SLa,b

| Parameters | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = mode   | <p><b>Values:</b></p> <p><b>S</b> = Start Time Mode. This is the time that is read from the Real-Time Clock when label formatting begins (when ^XA is received). The first label has the same time placed on it as the last label.</p> <p><b>T</b> = Time Now Mode. This is the time that is read from the Real-Time Clock when the label to be printed is placed in print queue. <i>Time Now</i> is similar to a serialized time or date field.</p> <p><b>Numeric Value</b> = With the Enhanced Real Time Clock (V60.13.0.10 or later) a time accuracy tolerance can be specified. Range = 1 to 999 seconds, 0 = one second tolerance</p> <p><b>Example:</b> <b>SL30,1</b> = Accuracy tolerance of 30 seconds and use English.</p> <p><b>Default:</b> S</p> |

**aa.**These values are only supported on the Xi4, RXi4, ZM400/ZM600, and RZ400/RZ600 printers.

**Format:** ^SLa,b

| Parameters                                                                                                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>b</b> = language<br><br>.14↑<br><br>Value 13 is only supported in firmware versions V60.14.x, V50.14.x, or later. | <p><b>Values:</b></p> <p>1 = English<br/>     2 = Spanish<br/>     3 = French<br/>     4 = German<br/>     5 = Italian<br/>     6 = Norwegian<br/>     7 = Portuguese<br/>     8 = Swedish<br/>     9 = Danish<br/> <b>10</b> = Spanish 2<br/> <b>11</b> = Dutch<br/> <b>12</b> = Finnish<br/> <b>13</b> = Japanese<br/> <b>14</b> = Korean <sup>aa</sup><br/> <b>15</b> = Simplified Chinese <sup>aa</sup><br/> <b>16</b> = Traditional Chinese <sup>aa</sup><br/> <b>17</b> = Russian <sup>aa</sup><br/> <b>18</b> = Polish <sup>aa</sup></p> <p><b>Default:</b> the language selected with <b>^KL</b> or the control panel</p> |

**aa.**These values are only supported on the Xi4, RXi4, ZM400/ZM600, and RZ400/RZ600 printers.

**Comments** These are some comments to be aware of:

- The **^SL** command must be placed before the first **^FO** command.
- As of V60.13.0.10 all supported printers have Enhanced Real Time Clock capabilities the RTC will not print time fields that are more than sixty seconds old, rather it will update the time prior to printing (**^SLT** or **^SL60**). To control time with increments other than sixty seconds the **^SL** command can be used with a numeric value (**^SL30**).  
**^SLS** can keep times longer than sixty seconds.

For more details on set mode and language with the Real-Time Clock, see [Real Time Clock on page 1347](#).

## ^SN – Serialization Data

The ^SN command allows the printer to index data fields by a selected increment or decrement value, making the data fields increase or decrease by a specified value each time a label is printed. This can be performed on 100 to 150 fields in a given format and can be performed on both alphanumeric and bar code fields. A maximum of 12 of the right-most integers are subject to indexing.

.13↓

In x.13 and earlier, the first integer found when scanning from right to left starts the indexing portion of the data field.

.14↑

In x.14 and later, the first integer found when scanning from end of the backing store towards the beginning starts the indexing portion of the data field.

.13↓

In x.13 and earlier, if the alphanumeric field to be indexed ends with an alpha character, the data is scanned, character by character, from right to left until a numeric character is encountered. Serialization takes place using the value of the first number found.

.14↑

In x.14 and later, if the backing store of the alphanumeric field to be indexed ends with an alpha character, the data is scanned, character by character, from the end of the backing store until a numeric character is encountered. Serialization takes place using the value of the first number found.

**Format:** ^SNv,n,z

| Parameters                        | Details                                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| v = starting value                | <b>Values:</b> 12-digits maximum for the portion to be indexed<br><b>Default:</b> 1                                             |
| n = increment or decrement value  | <b>Values:</b> 12-digit maximum<br><b>Default:</b> 1<br>To indicate a decrement value, precede the value with a minus (-) sign. |
| z = add leading zeros (if needed) | <b>Values:</b><br>N = no<br>Y = yes<br><b>Default:</b> N                                                                        |

**Example:** This example shows incrementing by a specified value:

| ZPL II CODE                                                                                                                                               | GENERATED LABELS                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre> ^XA ^FO260,110 ^CFG ^SN001,1,Y^FS ^PQ3 ^XZ </pre> <p><i>Note: The ZPL II code above will generate three separate labels, seen to the right.</i></p> | <div style="display: flex; justify-content: space-around;"> <div style="text-align: center;">001</div> <div style="text-align: center;">002</div> <div style="text-align: center;">003</div> </div> |

**Comments** Incrementing and decrementing takes place for each serial-numbered field when all replicates for each serial number have been printed, as specified in parameter **r** of the **^PQ** (print quality) command.

If, during the course of printing serialized labels, the printer runs out of either paper or ribbon, the first label printed (after the media or ribbon has been replaced and calibration completed) has the same serial number as the *partial* label printed before the *out* condition occurred. This is done in case the last label before the *out* condition did not fully print. This is controlled by the **^JZ** command.

## Using Leading Zeros

In the **^SN** command, the **z** parameter determines if leading zeros are printed or suppressed. Depending on which value is used (**Y** = print leading zeros; **N** = do not print leading zeros), the printer either prints or suppresses the leading zeros.

The default value for this parameter is **N** (do not print leading zeros).

## Print Leading Zeros

.13↓

In x.13 and earlier, the starting value consists of the right-most consecutive sequence of digits.

.14↑

In x.14 and later, the starting value consists of the first number working backwards in the backing store consecutive sequence of digits.

The width (number of digits in the sequence) is determined by scanning from right to left until the first non-digit (space or alpha character) is encountered. To create a specific width, manually place leading zeros as necessary.

## Suppressing Leading Zeros

.13↓

In x.13 and earlier, the starting value consists of the right-most consecutive sequence of digits, including any leading spaces.

.14↑

In x.14 or later, the starting value consists of the first number working backwards in the backing store consecutive sequence of digits, including any leading spaces.

## ^SO – Set Offset (for Real-Time Clock)

The ^SO command is used to set the secondary and the tertiary offset from the primary Real-Time Clock.

**Note** • For each label only one **S02** command can be used. If more than one offset is required, **S03** must be used.

**Format:** ^SOa,b,c,d,e,f,g

| Parameters         | Details                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------|
| a = clock set      | <b>Values:</b><br>2 = secondary<br>3 = third<br><b>Default:</b> value must be specified |
| b = months offset  | <b>Values:</b> -32000 to 32000<br><b>Default:</b> 0                                     |
| c = days offset    | <b>Values:</b> -32000 to 32000<br><b>Default:</b> 0                                     |
| d = years offset   | <b>Values:</b> -32000 to 32000<br><b>Default:</b> 0                                     |
| e = hours offset   | <b>Values:</b> -32000 to 32000<br><b>Default:</b> 0                                     |
| f = minutes offset | <b>Values:</b> -32000 to 32000<br><b>Default:</b> 0                                     |
| g = seconds offset | <b>Values:</b> -32000 to 32000<br><b>Default:</b> 0                                     |

For more detail on set offset, see [Real Time Clock on page 1347](#).

## ^SP – Start Print

The ^SP command allows a label to start printing at a specified point before the entire label has been completely formatted. On extremely complex labels, this command can increase the overall throughput of the print.

The command works as follows: Specify the dot row at which the ^SP command is to begin. This creates a label *segment*. Once the ^SP command is processed, all information in that segment prints. During the printing process, all of the commands after the ^SP continue to be received and processed by the printer.

If the segment after the ^SP command (or the remainder of the label) is ready for printing, media motion does not stop. If the next segment is not ready, the printer stops mid-label and wait for the next segment to be completed. Precise positioning of the ^SP command requires a trial-and-error process, as it depends primarily on print speed and label complexity.

The ^SP command can be effectively used to determine the worst possible print quality. You can determine whether using the ^SP command is appropriate for the particular application by using this procedure.

If you send the label format up to the first ^SP command and then wait for printing to stop before sending the next segment, the printed label is a sample of the worst possible print quality. It drops any field that is out of order.

If the procedure above is used, the end of the label format must be:

^SP#^FS

**Comments** ^SPa

| Parameters                    | Details                                        |
|-------------------------------|------------------------------------------------|
| a = dot row to start printing | <b>Values:</b> 0 to 32000<br><b>Default:</b> 0 |

→ **Example:** In this example, a label 800 dot rows in length uses **^SP500**. Segment 1 prints while commands in Segment 2 are being received and formatted.

## ^SQ – Halt ZebraNet Alert

The ^SQ command is used to stop the ZebraNet Alert option.

**Format:** ^SQa,b,c

| Parameters         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| c = halt messages  | <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>Y = halt messages</li> <li>N = start messages</li> </ul> <p><b>Default:</b> Y</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## ^SR – Set Printhead Resistance

The ^SR command allows you to set the printhead resistance.

**Format:** ^SR#####

| Parameters                                             | Details                                                                                     |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------|
| ##### = resistance value<br>(four-digit numeric value) | <b>Values:</b> Accepted Value: 0488 to 1175<br><b>Default:</b> last permanently saved value |

**Comments** To avoid damaging the printhead, this value should be less than or equal to the value shown on the printhead being used. Setting a higher value could damage the printhead.

**Note** • New printer models automatically set head resistance.

## ^SS – Set Media Sensors

The ^SS command is used to change the values for media, web, ribbon, and label length set during the media calibration process. The media calibration process is described in your specific printer's user's guide.

**Format:** ^SSw,m,r,l,m2,r2,a,b,c

| Parameters                                       | Details                                                                                                     |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| w = web (three-digit value)                      | <b>Values:</b> 000 to 100<br><b>Default:</b> value shown on the media sensor profile or configuration label |
| m = media (three-digit value)                    | <b>Values:</b> 000 to 100<br><b>Default:</b> value shown on the media sensor profile or configuration label |
| r = ribbon (three-digit value)                   | <b>Values:</b> 000 to 100<br><b>Default:</b> value shown on the media sensor profile or configuration label |
| l = label length (in dots, four-digit value)     | <b>Values:</b> 0001 to 32000<br><b>Default:</b> value calculated in the calibration process                 |
| m2 = intensity of media LED (three-digit value)  | <b>Values:</b> 000 to 255<br><b>Default:</b> value calculated in the calibration process                    |
| r2 = intensity of ribbon LED (three-digit value) | <b>Values:</b> 000 to 255<br><b>Default:</b> value calculated in the calibration process                    |
| a = mark sensing (three-digit value)             | <b>Values:</b> 000 to 100<br><b>Default:</b> value calculated in the calibration process                    |
| b = mark media sensing (three-digit value)       | <b>Values:</b> 000 to 100<br><b>Default:</b> value calculated in the calibration process                    |
| c = mark LED sensing (three-digit value)         | <b>Values:</b> 000 to 255<br><b>Default:</b> value calculated in the calibration process                    |

**Example:** Below is an example of a media sensor profile. Notice the numbers from 000 to 100 and where the words WEB, MEDIA, and RIBBON appear in relation to those numbers. Also notice the black vertical spike. This represents where the printer sensed the transition from media-to-web-to-media.

The media and sensor profiles produced vary in appearance from printer to printer.

**Comments** The **m2** and **r2** parameters have no effect in Stripe® S-300 and S-500 printers.

This command is ignored on the HC100™ printer.

Maximum values for parameters depend on which printer platform is being used.

## ^ST – Set Date and Time (for Real-Time Clock)

The ^ST command sets the date and time of the Real-Time Clock.

Format: ^STA,b,c,d,e,f,g

| Parameters | Details                                                                                              |
|------------|------------------------------------------------------------------------------------------------------|
| a = month  | <b>Values:</b> 01 to 12<br><b>Default:</b> current month                                             |
| b = day    | <b>Values:</b> 01 to 31<br><b>Default:</b> current day                                               |
| c = year   | <b>Values:</b> 1998 to 2097<br><b>Default:</b> current year                                          |
| d = hour   | <b>Values:</b> 00 to 23<br><b>Default:</b> current hour                                              |
| e = minute | <b>Values:</b> 00 to 59<br><b>Default:</b> current minute                                            |
| f = second | <b>Values:</b> 00 to 59<br><b>Default:</b> current second                                            |
| g = format | <b>Values:</b> Accepted Values:<br>A = a.m.<br>P = p.m.<br>M = 24-hour military<br><b>Default:</b> M |

For more details on set date and time, see [Real Time Clock on page 1347](#).

## ^SX – Set ZebraNet Alert

The ^SX command is used to configure the ZebraNet Alert System.

**Format:** ^SXa,b,c,d,e,f

**Note** • The values in this table apply to firmware version V48.12.4 or later.

| Parameters                             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b> = condition type              | <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>A = paper out</li> <li>B = ribbon out</li> <li>C = printhead over-temp</li> <li>D = printhead under-temp</li> <li>E = head open</li> <li>F = power supply over-temp</li> <li>G = ribbon-in warning (Direct Thermal Mode)</li> <li>H = rewind full</li> <li>I = cut error</li> <li>J = printer paused</li> <li>K = PQ job completed</li> <li>L = label ready</li> <li>M = head element out</li> <li>N = ZBI (Zebra BASIC Interpreter) runtime error</li> <li>O = ZBI (Zebra BASIC Interpreter) forced error</li> <li>P = power on</li> <li>Q = clean printhead</li> <li>R = media low</li> <li>S = ribbon low</li> <li>T = replace head</li> <li>U = battery low</li> <li>V = RFID error (in RFID printers only)</li> <li>* = all errors</li> </ul> <p><b>Default:</b> if the parameter is missing or invalid, the command is ignored</p> |
| <b>b</b> = destination for route alert | <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>A = serial port</li> <li>B* = parallel port</li> <li>C = e-mail address</li> <li>D = TCP/IP</li> <li>E = UDP/IP</li> <li>F = SNMP trap</li> </ul> <p><b>Default:</b> If this parameter is missing or invalid, the command is ignored.</p> <p><b>* Requires</b> bidirectional communication.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameters                                                  | Details                                                                                                                                                                                                                                   |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>c</b> = enable condition set alert to this destination   | <b>Values:</b><br>N = no<br>Y = yes<br><b>Values:</b> Y or previously configured value                                                                                                                                                    |
| <b>d</b> = enable condition clear alert to this destination | <b>Values:</b><br>N = no<br>Y = yes<br><b>Values:</b> N or previously configured value<br>Parameters <b>e</b> and <b>f</b> are sub-options based on destination. If the sub-options are missing or invalid, these parameters are ignored. |
| <b>e</b> = destination setting                              | <b>Values:</b><br>Internet e-mail address (e.g. user@company.com)<br>IP address (for example, 10.1.2.123)<br>SNMP trap<br>IP or IPX addresses                                                                                             |
| <b>f</b> = port number                                      | <b>Values:</b><br>TCP port # (0 to 65535)<br>UDP port # (0 to 65535)                                                                                                                                                                      |

→ **Example:** This is an example of the different (b) destinations that you can send for the condition type (a):

Serial: ^SXA,A,Y,Y  
 Parallel: ^SXA,B,Y,Y  
 E-Mail: ^SXA,C,Y,Y,admin@company.com  
 TCP: ^SXA,D,Y,Y,123.45.67.89,1234  
 UDP: ^SXA,E,Y,Y,123.45.67.89,1234  
 SNMP Trap: ^SXA,F,Y,Y,255.255.255.255

**Comments** In the example above for SNMP Trap, entering 255.255.255.255 broadcasts the notification to every SNMP manager on the network. To route the device to a single SNMP manager, enter a specific address (123.45.67.89).

## ^SZ – Set ZPL Mode

The ^SZ command is used to select the programming language used by the printer. This command gives you the ability to print labels formatted in both ZPL and ZPL II.

This command remains active until another ^SZ command is sent to the printer or the printer is turned off.

**Format:** ^S<sub>a</sub>Z

| Parameters      | Details                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------|
| a = ZPL version | <p><b>Values:</b> Accepted Values:</p> <p>1 = ZPL<br/>2 = ZPL II</p> <p><b>Default:</b> 2</p> |

**Comments** If the parameter is missing or invalid, the command is ignored.

## ~TA – Tear-off Adjust Position

The ~TA command lets you adjust the rest position of the media after a label is printed, which changes the position at which the label is torn or cut.

**Format:** ~TA###

**Important** • These are some important facts about this command:

- For 600 dpi printers, the step size doubles.
- If the number of characters is **less than 3**, the command is ignored.

| Parameters                                                                       | Details                                                                                                              |
|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| ### = change in media rest position<br>(3-digit value in dot rows must be used.) | <b>Values:</b><br><b>-120 to 120</b><br><b>0 to 120</b> (on the HC100)<br><b>Default:</b> last permanent value saved |

**Comments** If the parameter is missing or invalid, the command is ignored.

## ^TB – Text Blocks

**.14↑**

This command is available only for printers with firmware version V60.14.x, V50.14.x, or later.

The ^TB command prints a text block with defined width and height. The text block has an automatic word-wrap function. If the text exceeds the block height, the text is truncated. This command supports complex text layout features.

**Note** • ^TB is the preferred command for printing fields or blocks of text, instead of ^FB.

**Format:** ^T<sub>a</sub>B<sub>b</sub>,<sub>c</sub>

| Parameters                      | Details                                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b> = block rotation       | <b>Values:</b><br>N = normal<br>R = rotate 90 degrees clockwise<br>I = invert 180 degrees<br>B = read from bottom up-270 degrees<br><b>Default:</b> whatever was specified by the last ^A (which has the default of ^FW) |
| <b>b</b> = block width in dots  | <b>Values:</b><br>1 to the width of the label in dots<br><b>Default:</b> 1 dot                                                                                                                                           |
| <b>c</b> = block height in dots | <b>Values:</b><br>1 to the length of the label in dots<br><b>Default:</b> 1 dot                                                                                                                                          |

**Comments** Facts about the ^TB command:

- Justification of ^TB command comes from ^FO, ^FT, or ^FN command. If no justification is determined then the default is auto justification.
- Data between < and > is processed as an escape sequence; for example, <<> will print <.
- The ^TB command has an automatic word-wrap function. Soft hyphens do not print and are not used as a line break position.

## ^TO – Transfer Object

The ^TO command is used to copy an object or group of objects from one storage device to another. It is similar to the copy function used in PCs.

Source and destination devices must be supplied and must be different and valid for the action specified. Invalid parameters cause the command to be ignored.

The asterisk (\*) can be used as a wild card for object names and extensions. For instance, ZEBRA.\* or \*.GRF are acceptable forms for use with the ^TO command.

At least one source parameter (**d**, **o**, or **x**) and one destination parameter (**s**, **o**, or **x**) must be specified. If only ^TO is entered, the command is ignored.

**Format:** ^TOs:o.x,d:o.x

| Parameters                                         | Details                                                                                                                                                        |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>s</b> = source device of stored object          | <b>Values:</b> R:, E:, B:, and A:<br><b>Default:</b> if a drive is not specified, all objects are transferred to the drive set in parameter <b>s</b>           |
| <b>o</b> = stored object name                      | <b>Values:</b> any existing object conforming to Zebra conventions<br><b>Default:</b> if a name is not specified, * is used — all objects are selected         |
| <b>x</b> = extension                               | <b>Values:</b> any extension conforming to Zebra conventions<br><b>Default:</b> if an extension is not specified, * is used — all extensions are selected      |
| <b>d</b> = destination device of the stored object | <b>Values:</b> R:, E:, B:, and A:<br><b>Default:</b> a destination must be specified                                                                           |
| <b>o</b> = name of the object at destination       | <b>Values:</b> up to 8 alphanumeric characters<br><b>Default:</b> if a name is not specified, the name of the existing object is used                          |
| <b>x</b> = extension                               | <b>Values:</b> any extension conforming to Zebra conventions<br><b>Default:</b> if an extension is not specified, the extension of the existing object is used |

**Comments** Parameters **o**, **x**, and **s** support the use of the wild card (\*).

If the destination device does not have enough free space to store the object being copied, the command is canceled.

Zebra files (Z:\*.\*) cannot be transferred. These files are copyrighted by Zebra Technologies.

## Transferring Objects

These are some examples of using the ^TO command.

- **Example 1:** To copy the object **ZLOGO.GRF** from DRAM to an optional Memory Card and rename it **ZLOGO1.GRF**, write the following format:

```
^XA  
^TOR:ZLOGO.GRF,B:ZLOGO1.GRF  
^XZ
```

- **Example 2:** To copy the object **SAMPLE.GRF** from an optional Memory Card to DRAM and keep the same name, write this format:

```
^XA  
^TOB:SAMPLE.GRF,R:SAMPLE.GRF  
^XZ
```

## Transferring Multiple Objects

The asterisk (\*) can be used to transfer multiple object files (except \*.FNT) from DRAM to the Memory Card. For example, assume you have several object files that contain logos. These files are named **LOGO1.GRF**, **LOGO2.GRF**, and **LOGO3.GRF**.

To transfer all these files to the memory card using the name NEW instead of LOGO, place an asterisk after the names NEW and LOGO in the transfer command. This copies all files beginning with LOGO in one command.

```
^XA  
^TOR:LOGO*.GRF,B:NEW*.GRF  
^XZ
```

During a multiple transfer, if a file is too big to be stored on the memory card, that file is skipped. All remaining files attempt to be transferred. All files that can be stored within the space limitations are transferred, while other files are ignored.

## ~WC – Print Configuration Label

The ~WC command is used to generate a printer configuration label. The printer configuration label contains information about the printer setup, such as sensor type, network ID, ZPL mode, firmware version, and descriptive data on the R:, E:, B:, and A: devices.

**Format:** ~WC

**Comments** This command works only when the printer is idle.

## ^WD – Print Directory Label

The ^WD command is used to print a label listing bar codes, objects stored in DRAM, or fonts.

For bar codes, the list shows the name of the bar code. For fonts, the list shows the name of the font, the number to use with ^A command, and size. For objects stored in DRAM, the list shows the name of the object, extension, size, and option flags. All lists are enclosed in a double-line box.

**Format:** ^WDd:o.x

| Parameters                                                                                                                            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>d</b> = source device — optional                                                                                                   | <b>Values:</b> R:, E:, B:, A: and Z:<br><b>Default:</b> R:                                                                                                                                                                                                                                                                                                                                                                                                   |

## ~WQ – Write Query

The ~WQ command triggers the printer to print a label with odometer, maintenance or alert, and printhead history information.

### Supported Devices

- Xi4 with firmware V53.17.1Z or later
- RXi4 with firmware V53.17.7Z or later
- ZM400/ZM600 with firmware V53.15.xZ or later
- RZ400/RZ600 with firmware R53.15.xZ or later
- S4M with firmware V53.15.4Z or later
- G-Series

**Format:** ~WQquery-type

| Parameter  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

*ac*.This error flag is supported only on KR403 printers.

## ~WQ Examples

This section provides detailed examples of all the available parameters.

**Example 1:** This example shows how to request the printer's status.

1. To request the printer's status, type **~WQES**

A label similar to this prints out:

|                |   |                   |
|----------------|---|-------------------|
| PRINTER STATUS |   |                   |
| ERRORS:        | 1 | 00000000 00000005 |
| WARNINGS:      | 1 | 00000000 00000002 |

In this example, the Printer Status resolves to these conditions:

- The cover/printhead is open (value = 4).
- Media is out or not loaded into the printer (value = 1).
- The printhead needs to be cleaned (value = 2).
- Error nibble 1 is equal to 5 when the error status values are added together (4+1).

This illustration identifies the printer status definitions:

|   |             |
|---|-------------|
| 1 | Flag        |
| 2 | Nibble 16-9 |
| 3 | Nibble 8-4  |
| 4 | Nibble 3    |
| 5 | Nibble 2    |
| 6 | Nibble 1    |

→ **Example 2:** This example shows how to request the printer's status.

1. To request the printer's status, type **~WQES**  
A label similar to this prints out:

|                |   |                   |
|----------------|---|-------------------|
| PRINTER STATUS |   |                   |
| ERRORS:        | 1 | 00000000 0000000B |
| WARNINGS:      | 0 | 00000000 00000000 |

In the example shown above, the Printer Status resolves to the following conditions:

- The cutter has a fault. (value = 8).
- Ribbon is out or not loaded into the printer (value = 2).
- Media is out or not loaded into the printer (value = 1).
- Error byte 1 is equal to B when the error status values are added together  
**(8 + 2 + 1 = hexadecimal B).**

→ **Example 3:** This is an example of how to print the hardware address of the internal wired print server.

1. To print the hardware address of the internal wired print server, type **~WQHA**  
A label similar to this prints out:

|                   |  |  |
|-------------------|--|--|
| MAC ADDRESS       |  |  |
| 00:07:4d:2c:e0:7a |  |  |

→ **Example 4:** This is an example of how to print a summary of the printer's printhead test results.

The **^JT** command is used to initiate printhead testing, set the testing interval, and set the element range to be tested. For more details see, [^JT on page 269](#).

1. To request a summary of the printer's printhead test, type **~WQJT**  
A label similar to this prints out:

|                         |  |  |
|-------------------------|--|--|
| PRINT HEAD TEST RESULTS |  |  |
| 0,A,0000,0000,0000      |  |  |

When the printer has printed enough labels to trigger a printhead test, the initial data changes.

1. To request a summary of the printer's printhead test, type **~WQJT**  
A label similar to this prints out:

|                         |  |  |
|-------------------------|--|--|
| PRINT HEAD TEST RESULTS |  |  |
| 0,A,0015,0367,0000      |  |  |

This illustration identifies the printhead test field definitions:

|          |                                   |
|----------|-----------------------------------|
| <b>1</b> | Element failure                   |
| <b>2</b> | Manual (M) or automatic (A) range |
| <b>3</b> | First test element                |
| <b>4</b> | Last test element                 |
| <b>5</b> | Failure count                     |

→ **Example 5:** This is an example of how to print the maintenance alert query for the ~WQ command.

1. To get the current settings, type ~WQMA

A label similar to this prints out:

|                             |      |
|-----------------------------|------|
| MAINTENANCE ALERT SETTINGS  |      |
| HEAD REPLACEMENT INTERVAL:  | 1 km |
| HEAD REPLACEMENT FREQUENCY: | 0 M  |
| HEAD CLEANING INTERVAL:     | 0 M  |
| HEAD CLEANING FREQUENCY:    | 0 M  |
| PRINT REPLACEMENT ALERT:    | NO   |
| PRINT CLEANING ALERT:       | NO   |
| UNITS:                      | C    |

→ **Example 6:** This is an example of how to use the odometer query for the ~WQ command. Note that the units of measure are controlled by the ^MA command. Also, if the "Early Warning Maintenance State" is turned "ON" the printer response would also list LAST CLEANED and CURRENT PRINthead LIFE counters.

1. To get the current settings, type ~WQOD

A label similar to this prints out:

|                        |        |
|------------------------|--------|
| PRINT METERS           |        |
| TOTAL NONRESETTABLE:   | 8560 " |
| USER RESETTABLE CNTR1: | 9 "    |
| USER RESETTABLE CNTR2: | 8560 " |

The units of measure are set to inches.

1. To change the units of measure to centimeters, type:

**^XA^MA,,,C**

**^XZ**

The units of measure are set to centimeters.

2. To check the settings, type ~WQOD.

A label similar to this prints out:

|                        |          |
|------------------------|----------|
| PRINT METERS           |          |
| TOTAL NONRESETTABLE:   | 21744 cm |
| USER RESETTABLE CNTR1: | 24 cm    |
| USER RESETTABLE CNTR2: | 21744 cm |

→ **Example 7:** This is an example of how to print the maintenance information query for the ~WQ command. Note that the message is controlled by the ^MI command.

1. To get the current settings, type ~WQMI

A label similar to this prints out:

```
MAINTENANCE ALERT MESSAGES
CLEAN: PLEASE CLEAN PRINT HEAD
REPLACE: PLEASE REPLACE PRINT HEAD
```

→ **Example 8:** This is an example of how to print the printhead life query for the ~WQ command. Note that the units of measure are controlled by the ^MA command.

1. To get the current settings, type ~WQPH

A label similar to this prints out:

```
LAST CLEANED: 257 "
HEAD LIFE HISTORY
# DISTANCE
1: 257 "
2: 1489 "
3: 7070 "
```

|          |                                                                                                                              |
|----------|------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> | The current life of the print head.                                                                                          |
| <b>2</b> | Line items 2 through 10 (the example only shows 2 through 3) tracks the measurement for each time the print head is changed. |

→ **Example 9:** This is an example of how to print the printer's Plug and Play string.

1. To print the printer's Plug and Play string, type ~WQPP

A label similar to this prints out:

```
PLUG AND PLAY MESSAGES
MFG: Zebra Technologies
CMD: ZPL
MDL: GX420d
```

→ **Example 10:** This is an example of how to print the printer's serial number.

1. To get the printer's serial number, type ~WQSN

A label similar to this prints out:

```
SERIAL NUMBER
30A07070005
```

**Example 11:** This is an example of how to print the printer's USB product ID and BCD release version.

1. To print the printer's USB product ID and BCD release version, type ~WQUI  
A label similar to this prints out:

| USB INFORMATION  |       |
|------------------|-------|
| PID:             | 0084  |
| RELEASE VERSION: | 15.01 |

## ^XA – Start Format

The ^XA command is used at the beginning of ZPL II code. It is the opening bracket and indicates the start of a new label format. This command is substituted with a single ASCII control character STX (control-B, hexadecimal 02).

**Format:** ^XA

**Comments** Valid ZPL II format requires that label formats should start with the ^XA command and end with the ^XZ command.

## ^XB – Suppress Backfeed

The ^XB command suppresses forward feed of media to tear-off position depending on the current printer mode. Because no forward feed occurs, a backfeed before printing of the next label is not necessary; this improves throughput. When printing a batch of labels, the last label should not contain this command.

**Format:** ^XB

### ^XB in the Tear-off Mode

*Normal Operation:* backfeed, print, and feed to rest

*^XB Operation:* print (Rewind Mode)

### ^XB in Peel-off Mode

*Normal Operation:* backfeed, print, and feed to rest

*^XB Operation:* print (Rewind Mode)

**Note** • To prevent jamming in cutter mode, ^XB suppresses backfeed and cutting.

## ^XF – Recall Format

The ^XF command recalls a stored format to be merged with variable data. There can be multiple ^XF commands in one format, and they can be located anywhere within the code.

When recalling a stored format and merging data using the ^FN (Field Number) function, the calling format must contain the ^FN command to merge the data properly.

While using stored formats reduces transmission time, no formatting time is saved. The ZPL II format being recalled is saved as text strings that need to be formatted at print time.

**Format:** ^XFd:o.x

| Parameters                        | Details                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------|
| d = source device of stored image | <b>Values:</b> R:, E:, B:, and A:<br><b>Default:</b> search priority (R:, E:, B:, and A:)                    |
| o = name of stored image          | <b>Values:</b> 1 to 8 alphanumeric characters<br><b>Default:</b> if a name is not specified, UNKNOWN is used |
| x = extension l                   | <b>Fixed Value:</b> .ZPL                                                                                     |

For a complete example of the ^DF and ^XF command, see [^DF and ^XF — Download format and recall format on page 51](#).

## ^XG – Recall Graphic

The ^XG command is used to recall one or more graphic images for printing. This command is used in a label format to merge graphics, such as company logos and piece parts, with text data to form a complete label.

An image can be recalled and resized as many times as needed in each format. Other images and data might be added to the format.

**Format:** ^XGd:o.x, mx, my

| Parameters                              | Details                                                                                                      |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------|
| d = source device of stored image       | <b>Values:</b> R:, E:, B:, and A:<br><b>Default:</b> search priority (R:, E:, B:, and A:)                    |
| o = name of stored image                | <b>Values:</b> 1 to 8 alphanumeric characters<br><b>Default:</b> if a name is not specified, UNKNOWN is used |
| x = extension l                         | <b>Fixed Value:</b> .GRF                                                                                     |
| mx = magnification factor on the x-axis | <b>Values:</b> 1 to 10<br><b>Default:</b> 1                                                                  |
| my = magnification factor on the y-axis | <b>Values:</b> 1 to 10<br><b>Default:</b> 1                                                                  |

**Example:** This is an example of using the ^XG command to recall the image SAMPLE.GRF from DRAM and print it in five different sizes in five different locations on the same label:

```

^XA
^FO100,100^XGR:SAMPLE.GRF,1,1^FS
^FO100,200^XGR:SAMPLE.GRF,2,2^FS
^FO100,300^XGR:SAMPLE.GRF,3,3^FS
^FO100,400^XGR:SAMPLE.GRF,4,4^FS
^FO100,500^XGR:SAMPLE.GRF,5,5^FS
^XZ

```

## ^XS – Set Dynamic Media Calibration

The ^XS command controls whether dynamic media calibration is performed to compensate for variations in label length, position, transmissivity, and/or reflectance after a printer is powered-up or the printer has been opened (for example to change or check the media).

### Supported Devices

- G-Series

**Format:** ^XSlength,threshold

| Parameters                                                                   | Details                                                          |
|------------------------------------------------------------------------------|------------------------------------------------------------------|
| <b>length</b> = dynamic length calibration                                   | <b>Values:</b><br>Y = enable<br>N = disable<br><b>Default:</b> Y |
| <b>threshold</b> = dynamic threshold calibration                             | <b>Values:</b><br>Y = enable<br>N = disable<br><b>Default:</b> Y |
| <b>gain</b> = dynamic gain calibration<br>(to be in a future implementation) | <b>Values:</b><br>Y = enable<br>N = disable<br><b>Default:</b> Y |

## ^XZ – End Format

The ^XZ command is the ending (closing) bracket. It indicates the end of a label format. When this command is received, a label prints. This command can also be issued as a single ASCII control character ETX (Control-C, hexadecimal 03).

**Format:** ^XZ

**Comments** Label formats must start with the ^XA command and end with the ^XZ command to be in valid ZPL II format.

## ^ZZ – Printer Sleep

The ^ZZ command places the printer in an idle or shutdown mode.

**Format:** ^ZZt,b

| Parameters                                         | Details                                                                                                                                                                 |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| t = number of second (idle time) prior to shutdown | <b>Values:</b> 0 to 999999 – setting 0 disables automatic shutdown<br><b>Default:</b> last permanently saved value or 0                                                 |
| b = label status at shutdown                       | <i>Accepted Values:</i><br>Y = indicates to shutdown when labels are still queued<br>N = indicates all labels must be printed before shutting down<br><b>Default:</b> N |

**Comments** The ^ZZ command is only valid on the PA400 and PT400 battery-powered printers.

# ZPL RFID Commands

This section contains the ZPL II commands for RFID-specific applications.

For additional information, refer to the *RFID Programming Guide* for your printer. A copy is available on the User CD provided with your printer and online at  
<http://www.zebra.com/manuals>.

## RFID Command Overview

In addition to reading or encoding RFID tags, the RFID ZPL commands also provide for RFID exception handling, such as setting the number of read/write retries before declaring a transponder defective (set with `^RR`, `^RT`, and `^WT`) or setting the number of labels that will be attempted if an error occurs (set with `^RS`).

For example, if an RFID label fails to program correctly or if the transponder cannot be detected, the printer ejects the label and prints VOID across it. The printer will try to print another label with the same data and format for the number of RFID labels specified by the `^RS` command. If the problem persists, the printer follows the error handling instructions specified by the `^RS` command: the printer may remove the problematic format from the print queue and proceed with the next format (if one exists in the buffer), or it may place the printer in Pause or Error mode.

If a parameter is designated as *not applicable* for a particular printer, any value entered for the parameter will be ignored, but the place holder for the field is required.

## Printer and Firmware Compatibility

Before using a particular command, verify that it is compatible with your printer and firmware version. See the following tables:

- [Table 19, ZD500R Series Printer Command and Firmware Compatibility on page 373](#)
- [Table 20, RXi Series Printer Command and Firmware Compatibility on page 374](#)
- [Table 21, RZ Series and R110PAX4 Printer Command and Firmware Compatibility on page 375](#)
- [Table 22, R4Mplus, RP4T, and R2844-Z Printer Command and Firmware Compatibility on page 376](#)

**Table 19 • ZD500R Series Printer Command and Firmware Compatibility**

| Command                                | Function                                                              | ZD500R   |
|----------------------------------------|-----------------------------------------------------------------------|----------|
|                                        |                                                                       | Firmware |
|                                        |                                                                       | all      |
| <a href="#">^HL or ~HL on page 377</a> | Return RFID Data Log to Host                                          | *        |
| <a href="#">^HR on page 379</a>        | Calibrate RFID Tag Position                                           | *        |
| <a href="#">^HV on page 232</a>        | Host Verification                                                     | *        |
| <a href="#">^RA on page 386</a>        | Read AFI or DSFID Byte                                                | —        |
| <a href="#">^RB on page 388</a>        | Define EPC Data Structure                                             | *        |
| <a href="#">^RE on page 390</a>        | Enable/Disable E.A.S. Bit                                             | —        |
| <a href="#">^RF on page 391</a>        | Read or Write RFID Format                                             | *        |
| <a href="#">^RI on page 395</a>        | Get RFID Tag ID                                                       | —        |
| <a href="#">^RL on page 396</a>        | Lock/Unlock RFID Tag Memory                                           | *        |
| <a href="#">^RM on page 399</a>        | Enable RFID Motion                                                    | —        |
| <a href="#">^RN on page 400</a>        | Detect Multiple RFID Tags in Encoding Field                           | —        |
| <a href="#">~RO on page 327</a>        | Reset Advanced Counters                                               | *        |
| <a href="#">^RQ on page 401</a>        | Quick Write EPC Data and Passwords                                    | —        |
| <a href="#">^RR on page 403</a>        | Specify RFID Retries for a Block or Enable Adaptive Antenna Selection | —        |
| <a href="#">^RS on page 405</a>        | Set Up RFID Parameters                                                | *        |
| <a href="#">^RT on page 412</a>        | Read RFID Tag                                                         | —        |
| <a href="#">^RU on page 414</a>        | Read Unique RFID Chip Serialization                                   | *        |
| <a href="#">~RV on page 416</a>        | Report RFID Encoding Results                                          | —        |
| <a href="#">^RW on page 417</a>        | Set RF Power Levels for Read and Write                                | *        |
| <a href="#">^RZ on page 421</a>        | Set RFID Tag Password and Lock Tag                                    | —        |
| <a href="#">^WF on page 424</a>        | Encode AFI or DSFID Byte                                              | —        |
| <a href="#">^WT on page 425</a>        | Write (Encode) Tag                                                    | —        |
| <a href="#">^WV on page 427</a>        | Verify RFID Encoding Operation                                        | —        |

\* = Supported

— = Not supported

- a. Use the ^RF, ^RM, and ^RR commands rather than the ^RT command.
- b. Use the ^RF, ^RM, ^RR, and ^WV commands rather than the ^WT command.

**Table 20 • RXi Series Printer Command and Firmware Compatibility**

| Command                                | Function                                                              | R110Xi4  | R110XiHF | R110Xi<br>and R170Xi             |
|----------------------------------------|-----------------------------------------------------------------------|----------|----------|----------------------------------|
|                                        |                                                                       | Firmware |          |                                  |
|                                        |                                                                       | all      | all      | all                              |
| <a href="#">^HL or ^HL on page 377</a> | Return RFID Data Log to Host                                          | *        | *        | *                                |
| <a href="#">^HR on page 379</a>        | Calibrate RFID Tag Position                                           | *        | *        | *                                |

\* = Supported

— = Not supported

a. Use the ^RF, ^RM, and ^RR commands rather than the ^RT command.

b. Use the ^RF, ^RM, ^RR, and ^WV commands rather than the ^WT command.

c. For parameter e, the only accepted value is N for No Action.

## ^HL or ~HL – Return RFID Data Log to Host

The printer continually logs RFID data and stores it in the printer's RAM. This command requests that the RFID data log be returned to the host computer, to clear the current data log, and to restart data recording. The ~HL command is processed immediately, while the ^HL command is processed after all of the previous formats (^XA ... ^XZ) have been processed.

**Format:** ^HL or ~HL

In the log, RFID data displays in this format:

[RFID operation],[program position],[antenna element],  
[read or write power],[RFID status],[data]

where

**[RFID operation]**

R = read  
W = write  
L = lock  
S = RFID settings  
E = log file reset

**[program position],[antenna element],[read or write power]\***

Additional information about the program position, the antenna, and the read or write power follows the RFID operation.

Such as:

**R,F1,D3,27,00000000,DATA**

where **F1** = the program position, **D3** = the antenna, and **27** is the write power.

\* With some older versions of firmware, these parameters do not display.

**[RFID status]**

##### or ##### = an RFID error code (See the *RFID Programming Guide* for your printer for more information on error codes. A copy of the manual is located on the User CD that came with your printer, or you can download a copy from <http://www.zebra.com/manuals>.)

**RPWR** = read power

**WPWR** = write power

**ANT** = antenna

**PPOS** = program position

**FFFFFF** (or limited to length **FFFF** for some printers) = indicates that the log file was reset

**[data]**

the data read or written

### Comments

- Data is shown in the format specified by the ^RFW command (ASCII, Hex, or EPC).
- If the log exceeds 64K (approximately 1500 operations), the data log is cleared automatically, and data recording restarts. When this happens, the following appears in the log:

**E,FFFFFF,LogFile automatically reset**

- If the printer loses power, the log is lost. If the log results are important to you, retrieve the information frequently.

## ^HR – Calibrate RFID Tag Position

Use this command to initiate tag calibration for RFID media. During the tag calibration process (which can take up to 5 minutes on some printers, depending on the type of RFID inlay and the label size) the printer moves the media, reads the tag's TID to determine chip type, calibrates the RFID tag position, and determines the optimal settings for the RFID media being used. Depending on the printer, these settings include the programming position, the antenna element to use, and the read/write power level to use.

**Important** • Consider the following before using this command:

- This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.
- For the R110Xi4 and ZD500R printers, leave all transponders before and after the tag that is being calibrated. This allows the printer to determine RFID settings which do not encode the adjacent tag. Allow a portion of media to extend out the front of the printer to allow for backfeed during the tag calibration procedure.
- With some printers, you should not perform transponder calibration for RFID media that meets the transponder placement specifications for your printer because doing so will slow the printer's throughput unnecessarily. For more information about tag calibration, refer to the *RFID Programming Guide* for your printer. A copy of the manual is located on the User CD that came with your printer, or you can download a copy from <http://www.zebra.com/manuals>.

Results of the ^HR tag calibration are returned to the host computer. The "run" option in the **rfid.tag.calibrate** SGD command performs the same calibration but does not create a results table.

To restore the printer's default programming position at any time, use the "restore" option in the **rfid.tag.calibrate** SGD command (see [rfid.tag.calibrate](#) on page 888).

**Format:** ^H<sub>a</sub>R<sub>b</sub>,<sub>c</sub>,<sub>d</sub>,<sub>e</sub>

| Parameters              | Details                                                                                                                                                  |

| <b>c</b> = start position | <p>This parameter specifies the start position of the calibration range. All numeric values are in millimeters. Forward or backward designations assume that the label's initial position is with the leading edge at the print line.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>Forward: F0 to Fxxx</b> (where xxx is the label length in millimeters or 999, whichever is less)</li> <li>The printer feeds the label forward for the specified distance and then begins transponder calibration.</li> <li><b>Backward: B0 to B30</b> (Not valid on the RP4T printer.)</li> <li>The printer backfeeds the label for the specified distance and then begins transponder calibration. Allow at least 1.25 in. (32 mm) of empty media liner to extend out of the front of the printer.</li> </ul> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li><b>For the R110Xi4 and ZD500R: B20</b> —The printer backfeeds 20 mm before starting transponder calibration.</li> <li><b>For the ZT400 with RFID option: B30</b> —The printer backfeeds 30 mm before starting transponder calibration.</li> <li><b>For all other supported printers: F0</b>—The printer moves the media to the start position relative to the leading edge of the label and then performs the RFID tag calibration.</li> </ul>                                                                                                                                             |
| <b>d</b> = end position   | <p>This parameter specifies the end position of the calibration range (last program position to check). All numeric values are in millimeters. Forward or backward designations assume that the label's initial position is with the leading edge at the print line.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>Forward: F0 to Fxxx</b> (where xxx is the label length in millimeters or 999, whichever is less)</li> <li>The printer performs transponder calibration until it reaches the specified end position and then ends the process.</li> <li><b>Backward: B0 to B30</b> (Not valid on the RP4T printer.)</li> <li>The printer performs transponder calibration until it reaches the specified end position and then ends the process. Valid only with a backward start position that is greater than the end position.</li> <li><b>A</b> = Automatic (Valid only on the R110Xi4 and ZD500R printers.)</li> <li>The printer automatically ends the transponder calibration process after successfully reading and encoding a consecutive range of 5 mm on the label. The ZD500R also ensures that no other tags can be programmed at the programming position with the calibration-determined power levels.</li> </ul> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li><b>For the R110Xi4 and ZD500R: A</b></li> <li><b>For all other supported printers:</b> Label length as shown on the printer configuration label</li> </ul> |

| Parameters                                              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>e</b> = antenna and read/write power level detection | <p> <b>Note •</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only on the R110Xi4, ZD500R, and ZT400 printers.</li><li>• The ZD500R printer has only one antenna, so this parameter applies only to the read/write power level settings.</li></ul> <p>This parameter specifies whether to select the antenna and read/write power levels automatically or manually.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li><b>A</b> = Automatic. The printer automatically scans through the antennas and read/write power during calibration.</li><li><b>M</b> = Manual. The printer uses the current antenna and read/write power level settings.</li></ul> <p><b>Default: A</b></p> |

→ **Example 1:** When the printer is using Absolute mode and the following command is sent to the printer:

^XA^HR^XZ

the printer starts the transponder calibration and returns a results table such as the following:

```
start
position=195
215, ,
214, ,
213, ,
212, ,
211, ,
210, ,W
209,R,
208, ,
207, ,
206, ,W
205,R,
204, ,
203, ,
202, ,W
201,R,W
200,R,W
199,R,W
198,R,W
197,R,W
196,R,W
195,R,W <--- *****
194,R,W
193,R,W
192,R,W
191,R,W
190,R,W
189,R,
188, ,
187, ,
186, ,
185, ,
.
.
.
end
```

Each line in the results table appears as:

Row, Read Result, Write Result

where

Row = the dot row where calibration occurred

Read Result = results of calibration (R = read, " " = unable to read)

Write Result = results of calibration (W = write, " " = unable to write)

The optimal programming position is 195. This is identified at the top of the table (**position=195**) and with an arrow (<---\*\*\*\*\*) in the table.

→ **Example 2:** When the printer is using Relative mode and the following command is sent to the printer:

```
^HRstart,end,B20,F42,M
```

the printer starts the tag calibration and returns a results table such as the following:

```
start
position=F0 MM
leading edge
B20, ,
B19, ,
B18, ,
B17, ,
...
B8, ,
B7, ,
B6, ,
B5, ,
B4,R,W
B3,R,W
B2,R,W
B1,R,W
F0,R,W<---**** F0 MM
F1,R,W
F2,R,W
F3,R,W
F4, ,
F5, ,
F6, ,
F7, ,
F8, ,
F9, ,
F10, ,
...
F38, ,
F39, ,
F40, ,
F41, ,
F42, ,
trailing edge
end
```

Each line in the results table appears as:

Row, Read Result, Write Result

where

Row = the position from the leading edge of the label where calibration occurred

Read Result = results of calibration (R = read, “ ” = unable to read)

Write Result = results of calibration (W = write, “ ” = unable to write)

The optimal programming position is F0 (program with the leading edge of the label at the print line). This is identified at the top of the table (**position=F0 MM**) and with an arrow (<---\*\*\*\*) in the table.

→ **Example 3:** When the ^HR command is sent to the printer, the printer performs tag calibration and returns a results table such as the following:

```

```

In the results table, the tags visible to the antenna elements are numbered, and the EPC number that is unique to each tag is displayed.

Each line in the results table gives a row number followed by readings associated with RFID tags that are visible at that row. Multiple values on a line indicate that multiple tags were visible. The order of the RFID tags is arbitrary.

[Row],[Antenna Element],[Min Read Power],[Min Write Power],  
[Antenna Element],[Min Read Power],[Min Write Power] ...

where

- Row = the position from the leading edge of the label where calibration occurred
- Antenna Element = the antenna used (the ZD500R only has A1)
- Minimum Read Power = calibration results (0 – 30) for a tag visible from that row
- Minimum Write Power = calibration results (0 – 30) for the same tag

The read and write power values are left empty (such as A1, , ,) when no tag is found.

In the sample results table for this example, at position **B25** (25 mm behind the print line), two RFID tags are visible to the printer at antenna A1. Tag 1 (EPC 7109) can be read at power level 22 and written to at power level 28. Tag 2 (EPC BA29) can be read at power level 22 and written to at power level 27. At that position, Tags 2 and 3 are visible to antenna B1 while Tag 1 is not.

| Tag 1                     | ,Tag 2        | ,Tag 3 | ,Tag 4 | ,Tag 5 | ,Tag 1 | ,Tag 2 | ,Tag 3                | ,Tag 4          | ,Tag 5 | , |

The arrow (<---\*\*\*\*) in the table indicates that a valid program position and power levels were found during calibration. The program position is identified at the top of the table as **position=B14 MM** (backfeed 14 millimeters). The optimal antenna element at that position is A1. The optimal read power is 18, and the optimal write power is 25.

## ^RA – Read AFI or DSFID Byte

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to read the AFI or DSFID byte. The data can be returned to the host via the ^HV command.

**Format:** ^RA#,f,r,m,b

| Parameters                                      | Details                                                                                                                                                                 |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| # = field number specified with another command | The value assigned to this parameter should be the same as the one used in the ^RT command.<br><br><b>Values:</b> Accepted values: 0 to 9999<br><b>Default value:</b> 0 |
| f = format                                      | <b>Values:</b> Accepted values:<br>0 = ASCII<br>1 = Hexadecimal<br><b>Default value:</b> 0                                                                              |
| r = number of retries                           | <b>Values:</b> Accepted values: 0 to 10<br><b>Default value:</b> 0                                                                                                      |
| m = motion                                      | <b>Values:</b> Accepted values:<br>0 = Feed label after writing.<br>1 = No Feed after writing. Other ZPL may cause a feed.<br><b>Default value:</b> 0                   |
| b = type of byte to read                        | <b>Values:</b> Accepted values:<br>A = AFI byte<br>D = DSFID byte<br><b>Default value:</b> A                                                                            |

**Example 1:** This example reads the AFI byte in ASCII format and returns **AFI Byte:x** to the host. The printer will retry the command five times if necessary. A voided label is generated if the read is unsuccessful after these retries. The data read will go into the ^FN1 location of the recalled format.

```
^XA
^FO20,120^A0N,60^FN1^FS
^RA1,0,5,0^FS
^HV1,,AFI Byte:^FS
^XZ
```

- **Example 2:** This example reads the DSFID byte in ASCII format and returns **DSFID Byte:x** to the host. The printer will retry the command three times if necessary. A voided label is generated if the read is unsuccessful after these retries. The data read will go into the **^FN1** location of the recalled format.

```
^XA
^FO20,120^A0N,60^FN1^FS
^RA1,0,3,0,D^FS
^HV1,,DSFID Byte:^FS
^XZ
```

## ^RB – Define EPC Data Structure

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to define the structure of EPC data, which can be read from or written to an RFID tag. For more information about EPC specifications, refer to the EPC Global web site. All parameters in this command are persistent and will be used in subsequent formats if not provided. The values are initially set to the default values.

RFID tags can have different partitions defined. This command specifies the number of partitions and how many bits are in each partition.

**Format:** ^RBn,p0,p1,p2, ..., p15

| Parameters                           | Details                                                                                                                                                                                                                                                                           |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n = total bit size of the partitions | Specify the number of bits to include in the partitions.<br><b>Values:</b> Accepted values: 1 to n, where n is the bit size of the tag.<br><b>Default value:</b> 96                                                                                                               |
| p0 ... p15 = partition sizes         | Specify the number of bits to include in the individual partitions. The partition sizes must add up to the bit size specified for the previous parameter. The largest individual partition size is 64 bits.<br><b>Values:</b> Accepted values: 1 to 64<br><b>Default value:</b> 1 |

→ **Example 1:** The following command specifies that there are 96 bits used with three fields. Fields 1, 2, and 3 contain 10, 26, and 60 bits, respectively.

^RB96,10,26,60

The ZPL code to encode a tag with this format would look like this:

^RFW,E^FD1000.67108000.1122921504606846976^FS

When the tag is being encoded, the tag stores the data in the following way:

- Field 1 contains **1000**. This value is stored in the first 10 bits
- Field 2 contains **67108000**. This value is stored in the next 26 bits.
- Field 3 contains **1122921504606846976**. This value is stored in the remaining 60 bits.

→ **Example 2:** The following command specifies that there are 64 bits used with eight 8-bit fields.

^RB64,8,8,8,8,8,8,8,8^FS

The ZPL code to encode a tag with this format would look like this:

^RFW,E^FD1.123.160.200.249.6.1.0^FS

When writing to the tag, each set of data is written in its respective 8-bit field.

→ **Example 3:** This example uses the SGTIN-96 standard, which defines 96-bit structure in the following way:

|          | Header               | Filter Value            | Partition               | Company Prefix Index         | Item Reference                        | Serial Number                     |
|----------|----------------------|-------------------------|-------------------------|------------------------------|---------------------------------------|-----------------------------------|
| SGTIN-96 | 8 bits               | 3 bits                  | 3 bits                  | 20–40 bits                   | 24 bits                               | 38 bits                           |
|          | 10<br>(binary value) | 8<br>(decimal capacity) | 8<br>(decimal capacity) | 16,383<br>(decimal capacity) | 9 to 1,048,575<br>(decimal capacity*) | 33,554,431<br>(decimal capacity*) |

\* Capacity of Item Reference field varies with the length of the company prefix.

The ZPL code to encode a tag with this format would look like this:

```
^XA
^RB96,8,3,3,20,24,38^FS
^RFW,E^FD48,1,6,770289,10001025,1^FS
^XZ
```

These commands would put

- **48** in the header
- **1** as the filter value
- 6 as the partition (indicates a 20-bit prefix and 24-bit item reference)
- **770289** as the company prefix
- **10001025** as the item reference
- **1** as the serial number

To read this EPC data and print the results on the label, you would use the following code:

```
^XA
^RB96,8,3,3,20,24,38^FS
^FO50,50^A0N,40^FN0^FS
^FN0^RFR,E^FS
^XZ
```

The resulting label would look like this:

## ^RE – Enable/Disable E.A.S. Bit

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to enable or disable the Electronic Article Surveillance (E.A.S.) bit that is available in some ISO15693 tags (such as Philips). This command works only on those ISO15693 transponders and will be ignored if the tag does not support E.A.S.

**Format:** ^RET,r

| Parameters                                                    | Details                                                                                       |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| t = Enable/disable the E.A.S. bit in the ISO15693 transponder | <i>Accepted values:</i><br>N = Disable E.A.S.<br>Y = Enable E.A.S.<br><i>Default value:</i> N |
| r = number of retries                                         | <b>Values:</b> Accepted values: 0 to 10<br><i>Default value:</i> 0                            |

**Example:** This example enables the E.A.S. bit in the transponder. It will retry the command five times if necessary.

```
^XA  
^REy,5  
^XZ
```

## ^RF – Read or Write RFID Format

Use this command to read or write to (encode) an RFID tag or to specify the access password.

When using this command to read a tag, you may use a field variable to print the tag data on the label or to return the data to the host. For more information on how memory is stored on a Gen 2 tag or for examples that use a field variable, refer to the *RFID Programming Guide* for your printer. A copy of the manual is located on the User CD that came with your printer, or you can download a copy from <http://www.zebra.com/manuals>.

**Format:** ^RFo,f,b,n,m

| Parameters           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>o</b> = operation | <p>Specifies the action to be performed.</p> <p><i>Accepted Values:</i></p> <ul style="list-style-type: none"><li><b>W</b> = write to (encode) the tag</li><li><b>L</b> = write with LOCK (if supported by tag type; Gen 2 tag type does not use this locking function)</li><li><b>R</b> = read the tag</li><li><b>P</b> = read password (Gen 2 tag type only. Not supported on all Gen 2 printers, including the ZD500R printer.)</li><li><b>S</b> = specify the access password</li></ul> <p><b>Default:</b> W</p> |
| <b>f</b> = format    | <p><b>Values:</b></p> <ul style="list-style-type: none"><li><b>A</b> = ASCII</li><li><b>H</b> = Hexadecimal</li><li><b>E</b> = EPC (ensure proper setup with the ^RB command)</li></ul> <p><b>Default:</b> H</p>                                                                                                                                                                                                                                                                                                     |

| Parameters                                                                                                                                                                     | Details                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>n</b> = number of bytes to read or write | <p>Specifies the number of bytes to read or write.</p> <p><b>For high-frequency (HF) printers:</b></p> <p><b>Values:</b> 1 to <i>n</i>, where <i>n</i> is the maximum number of bytes for the tag.</p> <p><b>Default:</b> 1</p> <p><b>For Gen 2 tag type only:</b></p> <p>When E or A is specified for the memory bank parameter, this value is not required.</p> <p><b>Values:</b> 1 to <i>n</i>, where <i>n</i> is the maximum number of bytes for the tag.</p> <p><b>Default:</b> 1</p> <p><b>For all other printers and tag types:</b></p> <p>This parameter applies only when the starting block number is 1.</p> <p><b>Values:</b> 1 to <i>n</i>, where <i>n</i> is the maximum number of bytes for the tag. For UCODE EPC 1.19, <i>n</i> is 32.</p> <p><b>Default:</b> 1</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>m</b> = Gen 2 memory bank                |  <b>Note</b> • This parameter applies to Gen 2 tags only.<br><p>Specifies the Gen 2 memory bank. For more information about Gen 2 memory, refer to the <i>RFID Programming Guide</i> for your printer.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>E</b> = EPC 96-bit (When writing data, this parameter performs the operation on Gen 2 bit address 20<sub>h</sub> and accesses 12 bytes of the EPC memory bank. When reading data, this parameter reads the amount of data specified in the PC bits on the tag.)</li> <li><b>A</b> = EPC and Auto adjust PC bits (When writing data, this parameter performs the operation on Gen 2 bit address 20<sub>h</sub> of the EPC memory bank and accesses the number of bytes specified in the ^FD. The PC bits will be updated to match the amount of data written to the tag. When reading data, this parameter reads the amount of data specified in the PC bits on the tag.)</li> </ul> <p><b>NOTE:</b> This value is supported only by the ZD500R™ printer and ZT400™ Series RFID printers.</p> <ul style="list-style-type: none"> <li><b>0</b> = Reserved</li> <li><b>1</b> = EPC</li> <li><b>2</b> = TID (Tag ID)</li> <li><b>3</b> = User</li> </ul> <p><b>Default:</b> E</p> |

**Example 1:** This example encodes 96-bit data in ASCII format. (The ^RS command can be omitted for printers that use Gen 2 tag types only.)

```
^XA
^RS8
^RFW,A^FD00 my data^FS
^XZ
```

→ **Example 2:** This example encodes 96-bit EPC data, as specified by the ^RB command.

```
^XA
^RB96,8,3,3,20,24,38
^RFW,E^FD16,3,5,78742,146165,1234567891^FS
^XZ
```

→ **Example 3:** This example encodes 4 bytes of hexadecimal formatted data, starting in block 3 of Gen 2 EPC bank 1. (The ^RS command can be omitted for printers that use Gen 2 tag types only.)

```
^XA
^RS8
^RFW,H,3,4,1^FD11112222^FS
^XZ
```

→ **Example 4:** This example reads the extended Gen 2 tag ID (TID), which is not read by the ^RI command, and returns the results to the host computer. The results are labeled with the header “8-byte Tag ID Data.” (The ^RS command can be omitted for printers that use Gen 2 tag types only.)

```
^XA
^RS8
^RFR,H,0,8,2^FN1^FS^HV1,,8-byte Tag ID Data:^FS
^XZ
```

→ **Example 5:** This command writes and specifies both the access password (**12345678**) and the kill password (**88887777**) separated by a comma.

```
^RFW,H,P^FD12345678,88887777^FS
```

This command writes the access password only:

```
^RFW,H,P^FD12345678^FS
```

This command writes the kill password only (a comma must be used before it to distinguish it from an access password):

```
^RFW,H,P^FD,88887777^FS
```

See the examples for [^RL on page 396](#) for how this command would be used in a format.

→ **Example 6:** This command writes **1122334455667788** to the bit address 20h of the EPC memory and updates the PC bits bit address 10h to 14h to reflect 8 bytes (4 words) of data.

```
^RFW,H,,,A^FD1122334455667788^FS
```

→ **Example 7:** This command specifies the access password for the tag, which will be used in subsequent lock commands in the format. The access password specified must match the one stored on the tag. This command does not write the password to the tag. See the examples for [^RL on page 396](#) for how this command would be used in a format.

```
^RFS,H,P^FD12345678^FS
```

## ^RI - Get RFID Tag ID

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to get the unique serial number of the tag and return it in hexadecimal format. The data can be sent back to the host via the ^HV command.

For Gen 2 tag types, this command returns the 32-bit tag ID (TID) for the tag. If your Gen 2 tag supports TID data beyond 32 bits, see [^RF](#) on page 391 to access the TID memory bank.

**Format:** ^RIA,b,c,d

| Parameters                             | Details                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = number to be assigned to the field | <b>Values:</b> Accepted values: 0 to 9999<br><i>Default value:</i> 0                                                                                                                                                                                                                                                                                                  |
| b = specify data order                 | <br><b>Note</b> • This parameter applies only to the R110Xi HF and R2844-Z printers.<br><br><b>Values:</b><br>0 = Most significant byte first for Tag*It and PicoTag. | d = motion                             | <b>Values:</b> Accepted values:<br>0 = Feed label after writing<br>1 = No Feed after writing (other ZPL commands may cause a feed)<br><i>Default value:</i> 0                                                                                                                                                                                                         |

**Example:** This example reads a tag ID, prints it on a label, and sends string **Tag ID:xxxxxxxx** to the host. The data read will go into the ^FN0 location of the format. The printer will retry the command five times, if necessary.

```

^XA
^FO20,120^A0N,60^FN0^FS
^RI0,,5^FS
^HV0,,Tag ID:^FS
^XZ

```

## ^RL – Lock/Unlock RFID Tag Memory

The ^RL command has two distinct formats and functions:

- **^RLM – Lock/Unlock the Specified Memory Bank**  
Locks a password or an entire memory bank in a writeable or unwriteable state. These locks/unlocks can be permanent or reversible.
- **^RLB – Permanently Lock Specified Memory Sections**  
Locks blocks of user memory in an unwriteable state.

### ^RLM – Lock/Unlock the Specified Memory Bank

The ^RLM command locks/unlocks the specified password or memory bank on an RFID tag. You can use this command to do the following:

- lock individual passwords, thereby preventing or allowing subsequent reads or writes of that password
- lock individual memory banks, thereby preventing or allowing subsequent writes to those banks
- Permanently lock (permalock) the lock status for a password or memory bank

**Format:** ^RLM,k,a,e,u

| Parameters                    | Details                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| k = kill password function    | <b>Values:</b><br>U = unlock the kill password*<br>L = lock the kill password*<br>O = permanently unlock (Open) the kill password<br>P = permanently lock (Protected) the kill password               |
| a = access password function  | <b>Values:</b><br>U = unlock the access password*<br>L = lock the access password*<br>O = permanently unlock (Open) the access password<br>P = permanently lock (Protected) the access password       |
| e = EPC memory bank function  | <b>Values:</b><br>U = unlock the EPC memory bank*<br>L = lock the EPC memory bank*<br>O = permanently unlock (Open) the EPC memory bank<br>P = permanently lock (Protected) the EPC memory bank       |
| u = USER memory bank function | <b>Values:</b><br>U = unlock the USER memory bank*<br>L = lock the USER password bank*<br>O = permanently unlock (Open) the USER memory bank<br>P = permanently lock (Protected) the USER memory bank |

\* The access password must be set to something other than the default of 00000000 to use this value. See [Example 4 on page 397](#) for an example.

## ^RLB – Permanently Lock Specified Memory Sections

The ^RLB command permanently locks (permalocks) one or more sections (individual sub-portions) in a tag's user memory. The section sizes for each tag is defined by the tag manufacturer.

**Format:** ^RLB,s,n

| Parameters             | Details                                         |
|------------------------|-------------------------------------------------|
| s = starting section   | Specify the starting section of memory to lock. |
| n = number of sections | Specify the number of sections to lock.         |

- **Example 1:** The following command locks all memory banks using a previously specified access password.

^RLM,L,L,L,L^FS

- **Example 2:** The following command locks the user memory banks using a previously specified access password.

^RLM,,,L^FS

- **Example 3:** The following command permalocks sections 0 to 4 of user memory using a previously specified access password.

^RLB,0,4^FS

- **Example 4:** This code does the following:

- writes 12 bytes to user memory
- writes "12345678" to the access password and "11223344" to the kill password
- permalocks 6 sections of user memory using "12345678" as the access password
- locks the kill and access passwords and permanently unlocks the EPC memory, using "12345678" as the access password

^XA

^RFW,H,0,12,3^FD112233445566778899001122^FS

^RFW,H,P^FD12345678,11223344^FS

^RLB,0,6^FS

^RLM,L,L,0^FS

^XZ

**Example 5:** This code does the following:

- writes 12 bytes to user memory
- permalocks 6 sections of user memory using “00000000” as the access password
- permalocks the kill password and access password using “00000000” as the access password

^XA

^RLM,P,P^FS

^XZ

## ^RM – Enable RFID Motion

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to enable or disable RFID motion. By default, labels automatically print at the end of the format. This command allows you to inhibit the label from actually moving when it reaches the program position, which is useful for debugging, setup, and custom applications. This parameter is not persistent (carried over from label to label).

**Format:** ^RM<sub>e</sub>

| Parameters        | Details                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>e</b> = enable | <b>Values:</b> Accepted values:<br><b>Y</b> = Yes, move the label<br><b>N</b> = No, do not move the label<br><b>Default value:</b> Y |

## ^RN – Detect Multiple RFID Tags in Encoding Field

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to enable or disable detection of multiple RFID tags in the encoding field. By default, the printer checks for more than one tag in the field before attempting to read or write. If more than one tag is found, the label over the antenna support is voided, and the **RFID ERR STATUS** parameter on the control panel displays **MULTIPLE TAGS**. To speed up printing and encoding by up to 200 ms, the check may be disabled.

**Note** • This parameter is persistent across labels (carried over from label to label), but is NOT persistent across power cycles.

**Format:** ^RNe

| Parameters | Details                                                                                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| e = enable | <p><b>Values:</b></p> <p>Y = Yes, check for multiple tags<br/>N = No, do not check for multiple tags</p> <p><b>Default:</b></p> <p>Y = Printers with firmware R60.13.0.5 and earlier<br/>N = Printers with firmware R60.13.0.7 and later</p> <p> <b>Note</b> • If an invalid parameter value is entered, the default value will be used.</p> |

## ^RQ – Quick Write EPC Data and Passwords

**Important** • This command is not supported by all RFID tags, printers, or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command with an Alien Higgs RFID tag and appropriate firmware to write the EPC data, access password, and kill password with one command. Doing so reduces the encoding time.

**Note** • The access password on the tag to be written to must be 00000000 prior to sending this command.

**Format:** ^RQf,c,o[data]

| Parameters                                                     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| f = format                                                     | <b>Values:</b><br>A = ASCII<br>H = Hexadecimal<br>E = EPC<br><b>Default:</b> H                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| c = chip type                                                  | <b>Values:</b> 0 (Higgs IC tag)<br><b>Default:</b> 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| o = option                                                     | <b>Values:</b> 0 (write 96-bit EPC)<br><b>Default:</b> 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>data</b> = the EPC data, access password, and kill password | Use the ^FD command to specify the passwords in the following format:<br><code>^FD[EPC],[access],[kill]</code><br>where:<br><b>EPC</b> = the EPC data in the format specified by the <b>f</b> parameter. The data should match what would be programmed with the ^RF command.<br><b>access</b> = an optional access password in hexadecimal format. If this field is left blank, 0x00000000 is written as the access password.<br><b>kill</b> = an optional kill password in hexadecimal format. If this field is left blank, 0x00000000 is written as the kill password. |

**Example 1:** This example writes the EPC data to the tag in hexadecimal format. The unspecified access and kill passwords are written as zeroes (0x00000000).

```
^XA^RQ^FD112233445566778899001122^XZ
```

**Example 2:** This example writes the EPC data to the tag in hexadecimal format. The access password is written as 0xFFFFFFFF, and the kill password is written as 0xFFFFFFFF.

```
^XA^RQ^FD112233445566778899001122,FFFFFF,FFFFFF^XZ
```

- **Example 3:** This example writes the EPC data to the tag in EPC format. The unspecified access and kill passwords are written as zeroes (0x00000000).

`^XA^RB96,30,30,30,6^RQE^FD1234.5678.9012.12^XZ`

- **Example 4:** This example writes the EPC data to the tag in hexadecimal format. The access password is written as 0xAAAAAAA, and the unspecified kill password is written as zeroes (0x00000000).

`^XA^RB96,30,30,30,6^RQE^FD1234.5678.9012.12,AAAAAAA^XZ`

## ^RR – Specify RFID Retries for a Block or Enable Adaptive Antenna Selection

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command for the following:

- to change the number of times that the printer attempts to read or write to a particular block of a single RFID tag (Not applicable to printers with firmware V75.19.7Z or later.)
- to enable the adaptive antenna element selection feature

This command is persistent and will be used in subsequent formats if not provided.

**Note** • This command's function is different than the "number of labels" parameter in the ^RS command.

**Format:** ^RRn,a

| Parameters                             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n = number of retries                  | <p><b>Note</b> • This parameter does not apply to the ZT400 printer.</p> <p><b>Values:</b> 0 to 10<br/> <b>Default:</b> 6</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| a = adaptive antenna element selection | <p><b>Note</b> • This parameter is valid only on R110Xi4 and ZT400 printers with a label that is 2 in. (51 mm) or longer.</p> <p>If the printer cannot find RFID tags with the antenna element specified during the number of retries specified (if applicable), the printer may try neighboring antenna elements. If the printer is unsuccessful communicating with the RFID tag after trying the neighboring antenna elements, the printer voids the label.</p> <p><b>Note</b> • Activating this parameter may slow throughput on damaged or weak RFID tags.</p> <p><b>Values:</b> 0 or 1<br/> <b>0</b> = None. The printer uses only the current antenna element selection.<br/> <b>1</b> = Neighbors. The printer attempts to read the tag using the antenna elements to the left/right and above/below the current antenna element. The antenna element that is successful is used for all subsequent RFID commands until the next unsuccessful attempt.</p> <p><b>Default:</b> 0</p> |

- **Example 1:** This example sets the read block retries to 5.

```
^XA  
^FN1^RR5^RFR,H^FS  
^HV1^FS  
^XZ
```

- **Example 2:** This example sets the write block retries to 2.

```
^XA  
^RR2^RFW,H^FD1234^FS  
^XZ
```

- **Example 3:** On an R110Xi4 printer, this example sets the write retries to 2 and allows the printer to try neighboring antennas in the event that the current antenna cannot write to the RFID tag.

```
^XA  
^RR2,1^RFW,H^FD1234^FS  
^XZ
```

## ^RS – Set Up RFID Parameters

Use this command to set up RFID parameters including tag type; programming position; and error handlingIn addition to reading or encoding RFID tags, the RFID ZPL commands also provide for RFID exception handling, such as setting the number of read/write retries before declaring a transponder defective (set with ^RR, ^RT, and ^WT) or setting the number of labels that will be attempted if an error occurs (set with ^RS).

For example, if an RFID label fails to program correctly or if the transponder cannot be detected, the printer ejects the label and prints **VOID** across it. The printer will try to print another label with the same data and format for the number of labels specified (parameter **n**). If the problem persists, the printer follows the error handling instructions specified by the error handling parameter (parameter **e**): the printer may remove the problematic format from the print queue and proceed with the next format (if one exists in the buffer), or it may place the printer in Pause or Error mode.

Use care when using this command in combination with ^RT or ^RF for reading tag data. Problems can occur if the data read from the tag is going to be printed on the label. Any data read from the tag must be positioned to be printed above the read/write position. Failure to do this will prevent read data from being printed on the label.

**Format:** ^RSt,p,v,n,e,a,c,s

| Parameters   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>e</b> = error handling                   | If an error persists after the specified number of labels are tried, perform this error handling action.<br><b>Accepted values:</b><br><ul style="list-style-type: none"> <li><b>N</b> = No action (printer drops the label format causing the error and moves to the next queued label)</li> <li><b>P</b> = Place printer in Pause mode (label format stays in the queue until the user cancels)</li> <li><b>E</b> = Place printer in Error mode (label format stays in the queue until the user cancels)</li> </ul> <b>Default value:</b> N <p> <b>Note</b> • You can set the printer to send an error message to the host for each failure. To enable or disable this unsolicited error message, refer to the <b>^SX</b> and <b>^SQ</b> ZPL commands. Use <b>V</b> for the condition type for an RFID error.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>a</b> = signals on applicator            | <p> <b>Note</b> • This parameter does not apply to the R2844-Z. For the R4Mplus, this parameter applies only to printers with firmware version SP994X (R4Mplus European version).</p> <p><b>Single Signal Mode</b><br/>In this mode, one start print signal starts printing. Then, at the program position (parameter p), the printer automatically stops and encodes the tag. Printing continues, and a single end print signal signifies the completion of the label.</p> <p><b>Double Signal Mode</b><br/>With RFID, when there is a non-zero program position, the label is logically split into two parts. The first part is printed, the tag encodes, and then the second part prints. If this parameter is set to "D," then the label is split into two and requires both portions of the label to be controlled by the applicator. This means that a start print signal triggers the first portion of the label, and then when the printer reaches the RFID program position (and the motor stops), an end print signal is provided. In this mode, a second start print signal is required to print the rest of the label. When the label is complete, a final end print signal is provided.</p> <p> <b>Note</b> • If parameter p is zero, then single signal mode is used (parameter ignored). If p is F0 (or B0) with backfeed-after, then single signal mode is used (parameter ignored).</p> <p><b>Accepted values:</b></p> <ul style="list-style-type: none"> <li><b>S</b> = single signal</li> <li><b>D</b> = double signal (For the R110PAX4, Double mode will work only if the read/write position is changed from the default of zero.)</li> </ul> <p><b>Default value:</b> S</p> |

|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| s = void print speed |  <b>Note</b> • This parameter does not apply to the R2844-Z printer. For the R4Mplus printer, this parameter applies only to printers with firmware version SP994X (R4Mplus European version).<br>If a label is voided, the speed at which “VOID” will be printed across the label.<br><b>Values:</b> Accepted values: any valid print speed<br><b>Default value:</b> the printer’s maximum print speed |

**Supported Tag Types** Table 23 shows the tag types supported by different RFID printers/print engines and firmware versions. Depending on your country or on the firmware version that you are using, your printer may not support all of the tag types listed. If you specify an unsupported tag type, the printer uses the default value. If a tag type is shown as supported but does not work with your printer, you may need to upgrade the printer’s firmware (see <http://www.zebra.com/firmware>).

Table 23 • Supported Tag Types and Default Values

| Printer                           | UHF Printers        |                    |                   |                    |                    |                    |                    |                    |                                                  |                                                | HF Printers         |                    |           |

# = Default value \* = Accepted value — = Not supported

a. Requires R60.13.0.13ZD or later.

**Example 1:** The following are examples of Absolute Mode and Relative Mode for the tag position parameter (parameter p).

#### Absolute Mode

1. ^RS,520 sets the encode position at 520 dots from the top edge of the label.
2. ^RS,0 programs the tag without moving the media.

#### Relative Mode

1. ^RS,F1 sets the encode position 1 mm forward from the leading edge of the label.
2. ^RS,B10 sets the encode position 10 mm backwards from the leading edge of the label.
3. ^RS,F0 sets the encode position at the leading edge of the label.
4. ^RS,B0 sets the encode position at the leading edge of the label.

**Example 2:** The following shows the difference between absolute and relative programming positions for the tag position parameter (parameter **p**) with a 6-inch (152-mm, 1216-dot) label length. The end results are that the tag is programmed with the label in the same position.

|          |                                                                                |
|----------|--------------------------------------------------------------------------------|
| <b>1</b> | <code>^RS,496</code> , Absolute Mode, 496 dots from the top of the label       |
| <b>2</b> | <code>^RS,F90</code> , Relative Mode, 90 mm from the leading edge of the label |

## ^RT – Read RFID Tag

**Note** • The ^RT command is provided only for backward-compatibility with label formats that were developed for older Zebra RFID printers. See [Printer and Firmware Compatibility on page 373](#) for the list of printers and firmware with which you should not use this command.

Use this command to tell the printer to read the current RFID tag data. The data can be returned to the host via the ^HV command.

**Format:** ^RT#,b,n,f,r,m,s

| Parameters                             | Details                                                                                                                                                                                                                                                                                                              |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| # = number to be assigned to the field | <b>Values:</b> Accepted values: 0 to 9999<br><b>Default value:</b> 0                                                                                                                                                                                                                                                 |
| b = starting block number              | <b>Values:</b> Accepted values: 0 to n, where n is the maximum number of blocks for the tag.<br><b>Default value:</b> 0                                                                                                                                                                                              |
| n = number of blocks/bytes to read     | <b>Values:</b> Accepted values: 1 to n, where n is the maximum number of blocks for the tag type minus the starting block number. For example, if the tag has 8 blocks (starting with block 0) and you start with block 6, n can be 2. This would return block 6 and block 7 information.<br><b>Default value:</b> 1 |
| f = format                             | <b>Values:</b> Accepted values:<br>0 = ASCII<br>1 = Hexadecimal<br><b>Default value:</b> 0                                                                                                                                                                                                                           |
| r = number of retries                  | Changes the number of times that the printer attempts to read a particular block of a single RFID tag. (Same retry rules as the ^RR command.)<br><b>Values:</b> Accepted values: 0 to 10<br><b>Default value:</b> 0                                                                                                  |
| m = motion                             | Enables or disables RFID motion for the current field.<br><b>Values:</b> Accepted values:<br>0 = Feed label after writing.<br>1 = No feed after writing. Other ZPL may cause a feed.<br><b>Default value:</b> 0                                                                                                      |

| Parameters       | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| s = special mode | <p> <b>Note</b> • This parameter is used only for the printers referenced here.</p> <p><b>For R4Mplus printers with firmware version SP920X (U.S. version):</b><br/>Specify actions for mismatched checksums. For EPC Class 1 (Alien reader) only. Not applicable for EPC class 0.<br/><i>Default value:</i> 0<br/><b>Values:</b> Accepted values:<br/>0 = Do not read if mismatched checksum<br/>1 = Read even if mismatched checksum</p> <p><b>For R110Xi HF and R2844-Z printers:</b><br/>Specify data order.<br/><i>Default value:</i> 0<br/><b>Values:</b> Accepted values:<br/>0 = least significant byte first<br/>1 = most significant byte first</p> |

**Example 1:** This example reads a tag, prints the data on a label, and sends the string Tag Data:xxxxxxxx back to the host. The data read will go into the ^FN1 location of the format. The printer will retry the command five times, if necessary.

```
^XA
^FO20,120^A0N,60^FN1^FS
^RT1,,,5^FS
^HV1,,Tag Data:^FS
^XZ
```

**Example 2:** This example reads from a tag twice and prints the results on a label.

```
^XA
^FO20,120^A0N,60^FN1^FS
^FO20,100^A0N,20^FN2^FS
^RT1,7,3,,,5^FS
^RT2,3,2,,5^FS
^XZ
```

The first ^RT command starts at block 7 and reads three blocks of data in ASCII format. The data read will go into the ^FN1 location of the format. The printer will retry the command five times, if necessary.

The second ^RT command starts at block 2 and reads two blocks of data in ASCII format. The data read will go into the ^FN2 location of the format. The printer will retry the command five times, if necessary.

## ^RU – Read Unique RFID Chip Serialization

Use this command to read the TID (Tag ID) data from the current chip and format a unique 38-bit serial number, which will be placed in the lower (least significant) 38 bits of the EPC code.

**Format:** ^RUa,b

| Parameters            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = prefix            | <p>Specifies the prefix in ASCII Binary</p> <p><b>Values:</b> Only ASCII characters 1 and 0 are accepted. Maximum of 38 characters.</p> <p>The number of bits in the value specifies the length of the prefix. The prefix is placed as the left-most (most significant) bits in the unique serial number.</p> <p>If nothing is specified, the default value will be used.</p> <p><b>Default:</b> The MCS prefix is determined by the MDID in the TID of the chip read:</p> <ul style="list-style-type: none"> <li>• 100 = EM Micro</li> <li>• Impinj = 101</li> <li>• Alien = 110</li> <li>• NXP = 111</li> </ul> |
| b = special character | <p>Special character for serial number inclusion.</p> <p><b>Values:</b> Any ASCII character other than the current Command character, Control character, Delimiter character, or any of the Real-Time Clock (RTC) characters.</p> <p><b>Default:</b> #</p>                                                                                                                                                                                                                                                                                                                                                        |

### Note • Serial number inclusion:

One of several data elements can be included into any ^FD data string in the same way that Real Time Clock data is included. Use any of the commands below to include a data pattern based on the serial number. These are defined using the default value for the Special Character.

- #S = include 38-bit serial number derived from TID in decimal form.
- #H = include 38-bit serial number derived from TID in hexadecimal form.
- #E = include the entire 96-bit EPC code, including the 38-bit serial number derived from TID in decimal form.
- #F = include the entire 96-bit EPC code, including the 38-bit serial number derived from TID in hexadecimal form.
- #P = include the entire 96-bit EPC code, but use the tag's preprogrammed, 38-bit SGTIN serial number in decimal form.\*
- #Q = include the entire 96-bit EPC code, but use the tag's preprogrammed, 38-bit SGTIN serial number in hexadecimal form.\*

\* If the EPC has been preprogrammed (typically by the manufacturer) with the chip-based RFID serialization scheme, then the serialized data does not have to be written back to the EPC memory, which saves time. #P and #Q simply format the data that is read from the EPC memory bank.

- **Example 1:** Read the TID from the tag, create a serial number based on the tag type, write 12<serial number (5 bytes)>000000000000 to the 96-bit EPC field, and print the serial number (in hex format) on the label.

```
^XA  
^RU  
^FO10,10^A0N,50,50^FDSerial Number: #H^FS  
^RFW,H^FD12#H^FS  
^XZ
```

- **Example 2:** Read the TID from the tag, create a serial number based on the tag type, write the serial number to the EPC field (lower 38 bits) while maintaining the contents of the rest of the EPC memory, print **Serial Number: <serial number in hex format>** on the label, and return **Serial Number: <serial number in hex format>** to the host. Perform this operation on three label formats.

```
^XA  
^RU  
^FO10,10^A0N,50,50^FN1^FS  
^FN1^FDSerial Number: #H^FS  
^FH^HV1,24, ,_0D_0A,L^FS  
^RFW,H^FD#F^FS  
^PQ3  
^XZ
```

- **Example 3:** Read the full EPC (already serialized) from the tag, print **Serial Number: <full EPC in decimal format>** on the label, and return **Serial Number: <full EPC in decimal format>** to the host.

```
^XA  
^RU  
^FO10,10^A0N,50,50^FN1^FS  
^FN1^FDSerial Number: #P^FS  
^FH^HV1,44, ,_0D_0A,L^FS  
^XZ
```

## ~RV – Report RFID Encoding Results

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to tell the printer to send RFID encoding success or failure results to the host computer after each label format completes.

**Format:** ~RVa

| Parameters         | Details                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = enable/disable | <p>Enables or disables the results reporting feature.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>E = Enable</li> <li>D = Disable</li> </ul> <p><b>Default:</b> D</p> |

**Example 1:** Assume that the following code is sent and that there is no RFID tag in the field.

```
~RVE
^XA
^RS8,0,,3
^RMY
^RFR,H
^XZ
```

The printer attempts to program a tag three times and then returns the following to the host:

\_-,3\_-

The minus sign indicates that the programming attempt failed entirely and voided three labels.

**Example 2:** Assume that the same code is sent and that the first two attempts at programming a tag are unsuccessful. The third attempt succeeds.

```
~RVE
^XA
^RS8,0,,3
^RMY
^RFR,H
^XZ
```

The printer attempts to program a tag three times and then returns the following to the host:

\_+,2\_-

The plus sign indicates that the programming attempt was successful and voided two labels.

## ^RW – Set RF Power Levels for Read and Write

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to set the RFID read and write power levels if the desired levels are not achieved through RFID tag calibration. If not enough power is applied, the tag may not have sufficient power for programming, and tag data will fail to encode. If too much power is applied, the extra power may cause data communication errors or may cause the wrong tag to be programmed.

**Note** • For the R110Xi4, ZT400, and ZD500R printers:

During RFID tag calibration, the printer automatically selects the best read/write power levels and the best antenna element (not applicable to the ZD500R) for the media being used. The R110Xi4 printer may also set the levels during an adaptive antenna sweep. Use the `~HL` command (see [^HL or ~HL on page 377](#)) to view the antenna element and power settings being used.

**Note** • For the R110Xi4, ZT400, and ZD500R printers:

During RFID tag calibration, the printer automatically selects the best read/write power levels and the best antenna element (not applicable to the ZD500R) for the media being used. The R110Xi4 printer may also set the levels during an adaptive antenna sweep. Use the `~HL` command (see [^HL or ~HL on page 377](#)) to view the antenna element and power settings being used.

**Format:** ^RW<sub>r</sub>,w,a

| Parameters            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

→ **Example 1:** The following command selects the antenna at row D, column 3 on an R110Xi4 printer:

`^RW,,D3`

→ **Example 2:** The following command sets the read/write power level to Medium and selects antenna 2 on an R110Xi HF printer:

`^RWM,,2`

→ **Example 3:** The following command sets the read and write power levels to High on an R110PAX4 printer:

`^RWH,H`

## ^RZ – Set RFID Tag Password and Lock Tag

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to define a password for a tag during writing.

With Gen 2 tags, you can lock a tag's memory bank with an access password or define a kill password that can be used to permanently disable the tag. If you do not set access or kill passwords for a tag, the tag ignores any read or write commands that try to use these functions.

**Note** • The printer can set a kill password, but the printer cannot kill a tag.

**Format:** ^RZp,m,l

| Parameters      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameters     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 = lock style | <p> <b>Note</b> • This parameter applies to Gen 2 tags only.</p> <p>This parameter specifies the RFID tag password status.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>U = unlocked</li> <li>L = locked</li> <li>O = permanently unlocked (open)</li> <li>P = permanently locked (protected)</li> <li>W = write value (used only for the kill password memory bank)</li> </ul> <p><b>Default:</b> none</p> |

→ **Example 1:** On a tag that is not Gen 2, this example encodes **5A** as the tag password.

```
^XA
^RZ5A^FS
^XZ
```

→ **Example 2:** On a Gen 2 tag, this example encodes EPC data **112233445566778899001122** to the tag in Hex format, write protects the tag's EPC data with password **1234ABCD**, and leaves the tag's access password unlocked.

```
^XA
^RFW,H^FD112233445566778899001122^FS
^RZ1234ABCD,E,L^FS
^XZ
```

→ **Example 3:** On a Gen 2 tag, this example encodes EPC data **112233445566778899001122** to the tag in Hex format, write protects the tag's EPC data with password **1234ABCD**, and makes the tag's access password unreadable.

```
^XA
^RFW,H^FD112233445566778899001122^FS
^RZ1234ABCD,E,L^FS
^RZ1234ABCD,A,L^FS
^XZ
```

The following code unprotects EPC data **112233445566778899001122** using the password **1234ABCD**, encodes EPC data **newdata** to the tag in ASCII format, and then write protects the tag's new EPC data. The access password and its lock state are not changed, so the access password remains unreadable.

```
^XA
^RZ1234ABCD,E,U^FS
^RFW,A^FDnewdata^FS
^RZ1234ABCD,E,L^FS
^XZ
```

→ **Example 4:** This example unlocks the locked access password from the previous example.

```
^XA  
^RZ1234ABCD,A,U^FS  
^XZ
```

## ^WF – Encode AFI or DSFID Byte

Use this command to encode the AFI or DSFID byte to a tag. Error handling is set by the ^RS command.

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

**Format:** ^WFr,m,w,f,b

| Parameters               | Details                                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| r = number of retries    | <b>Values:</b> 0 to 10<br><b>Default:</b> 0                                                                                    |
| m = motion               | <b>Values:</b><br>0 = Feed label after writing.<br>1 = No Feed after writing. Other ZPL may cause a feed.<br><b>Default:</b> 0 |
| w = write protect        | <b>Values:</b><br>0 = Not write protected<br>1 = Write protect<br><b>Default:</b> 0                                            |
| f = data format          | <b>Values:</b><br>0 = ASCII<br>1 = Hexadecimal<br><b>Default:</b> 0                                                            |
| b = type of byte to read | <b>Values:</b><br>A = AFI byte<br>D = DSFID byte<br><b>Default:</b> A                                                          |

→ **Example 1:** This example encodes data “R” (hex 52) as the AFI byte. The printer will try the command up to five times, if necessary.

```
^XA
^WF5^FDR
^XZ
```

→ **Example 2:** This example encodes data hex 66 as the AFI byte. The printer will try the command up to three times, if necessary.

```
^XA
^WF3,,,1^FD66
^XZ
```

→ **Example 3:** This example encodes data hex 77 as the DSFID byte. The printer will try the command up to four times, if necessary.

```
^XA
^WF4,,,1,D^FD77
^XZ
```

## ^WT – Write (Encode) Tag

**Note** • The ^WT command is provided only for backward-compatibility with label formats that were developed for older Zebra RFID printers. See [Printer and Firmware Compatibility on page 373](#) for the list of printers and firmware with which you should not use this command.

Use this command to encode the current RFID tag. Check the amount of data memory available for the tag that you will be using. If you send more data than the memory can hold, the printer truncates the data.

**Format:** ^WTb,r,m,w,f,v

| Parameters                   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>b</b> = block number      | Specifies the block number to encode. This parameter is tag-dependent. <ul style="list-style-type: none"> <li>For most tags, use block 0.</li> <li>For EPC Class 0 Plus, block 0 is EPC data, and block 1 is user data.</li> <li>For the R4Mplus, this parameter does not apply to printers with firmware version SP902X. With other versions of firmware in this printer, you can encode 12 bytes (96 bits) to block 0, but you can encode only the first byte of block 1.</li> </ul> <b>Values:</b> 0 to <i>n</i> , where <i>n</i> is the maximum number of blocks for the tag.<br><b>Default:</b> 0 |
| <b>r</b> = number of retries | Changes the number of times that the printer attempts to encode a particular block of a single RFID tag. (Same function as the ^RR command.)<br><b>Values:</b> 0 to 10<br><b>Default:</b> 0                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>m</b> = motion            | Enables or disables RFID motion. (Same function as the ^RM command.)<br><b>Values:</b> <ul style="list-style-type: none"> <li>0 = Feed label after writing</li> <li>1 = No feed after writing (other ZPL may cause a feed)</li> </ul> <b>Default:</b> 0                                                                                                                                                                                                                                                                                                                                                |
| <b>w</b> = write protect     | <b>Values:</b> <ul style="list-style-type: none"> <li>0 = Not write protected</li> <li>1 = Write protected</li> </ul> <b>Default:</b> 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>f</b> = data format       | <b>Values:</b> <ul style="list-style-type: none"> <li>0 = ASCII</li> <li>1 = Hexadecimal</li> </ul> <b>Default:</b> 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameters                                                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>For the R110Xi HF:</b><br><b>v</b> = reverse the data order       | <p>This parameter is not used in the R2844-Z.</p> <p><b>For the R110Xi HF:</b><br/> <b>v</b> = reverse the data order.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>N</b> = Do not reverse the data order (Most significant byte first for Tag*It and PicoTag. Last significant byte first for I*code and ISO 15693)</li> <li><b>Y</b> = Reverse the data order</li> </ul> <p><b>Default:</b> N</p> |
| <b>For other supported printers:</b><br><b>v</b> = verify valid data | <p><b>For other supported printers:</b></p> <p>For reliability, some manufacturers encode tags with known data (such as A5A5). This parameter flags whether the preprogrammed data is verified. (Same function as the ^WV command.)</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>N</b> = Do not verify</li> <li><b>Y</b> = Verify valid data before writing</li> </ul> <p><b>Default:</b> N</p>     |

**Example:** This sample encodes data “RFIDRFID” and will try writing up to five times, if necessary.

```
^XA
^WT,5^FDRFIDRFID^FS
^XZ
```

## ^WV – Verify RFID Encoding Operation

**Important** • This command is not supported by all printers or firmware. See [Printer and Firmware Compatibility](#) on page 373 for the list of printers and firmware with which you can use this command.

Use this command to enable or disable the write verify function. When write verify is enabled, this command verifies the RFID encoding operation to ensure that the tag about to be programmed contains the hex data “A5A5” in the first two bytes. This parameter is not persistent (carried over from label to label).

**Format:** ^WVe

| Parameters | Details                                                           |
|------------|-------------------------------------------------------------------|
| e = enable | <b>Values:</b> Accepted values: Y or N<br><b>Default value:</b> N |

# **ZPL Wireless Commands**

This section contains ZPL commands for the Wireless and Wireless Plus print servers.

## ^KC – Set Client Identifier (Option 61)

The ^KC command allows the print server to have its own client identifier (CID).

**Format:** ^KCa,b,c,d

| Parameters            | Details                                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = enable or disable | <b>Values:</b><br>0 = disable (default)<br>1 = enabled, use MAC address<br>2 = enabled, ASCII value<br>3 = enabled, HEX value<br><b>Default:</b> 0                             |
| b = device            | <b>Values:</b><br>0 = all devices<br>1 = wireless<br>2 = external wired <sup>ad</sup><br>3 = internal wired<br><b>Default:</b> 1                                               |
| c = prefix (optional) | <b>Values:</b> 11 ASCII characters or 22 hexadecimal values.<br>The prefix can be cleared by defaulting the network settings on the printer.                                   |
| d = identifier        | <b>Values:</b> 60 ASCII characters or 120 hexadecimal values. Minimum field length is 2 bytes.<br>The suffix can be cleared by defaulting the network settings on the printer. |

**ad.**This applies only to the Xi4, RXi4, ZM400, ZM600, RZ400, or RZ600 printers when it is used with the external ZebraNet 10/100 print server using firmware v1.1.5 or later.

## ^NB – Search for Wired Print Server during Network Boot

Use this command to tell the printer whether to search for a wired print server at bootup. This command is ignored on the Xi4, RXi4, ZM400, ZM600, RZ400, and RZ600 printers.

**Note** • Only one print server can be installed in the S4M at one time, so this check does not occur.

Table 24 identifies which device becomes the active print server under different conditions.

**Table 24 • Results of Check for Wired Print Server**

| If the Check for<br>Wired Print<br>Server is set to: | Installed and Connected to<br>a Live Ethernet Network |                        | Then, the Active Print Server<br>will be: |
|------------------------------------------------------|-------------------------------------------------------|------------------------|-------------------------------------------|
|                                                      | Wired                                                 | Wireless <sup>ae</sup> |                                           |
| Skip                                                 | X                                                     | X                      | Wireless                                  |
|                                                      | X                                                     | —                      | Wired                                     |
|                                                      | —                                                     | X                      | Wireless                                  |
| Check                                                | X                                                     | X                      | Wired                                     |
|                                                      | X                                                     | —                      | Wired                                     |
|                                                      | —                                                     | X                      | Wireless                                  |

<sup>ae</sup>A wireless option board must have an active radio that can properly associate to an access point.

**Format:** ^NBa

| Parameters                                    | Details                                                            |
|-----------------------------------------------|--------------------------------------------------------------------|
| a = check for wired print server at boot time | <b>Values:</b><br>C = CHECK<br>S = SKIP CHECK<br><b>Default:</b> S |

## ^NN – Set SNMP

Use this command to set the Simple Network Management Protocol (SNMP) parameters.

**Format:** ^NNa,b,c,d,e,f

| Parameters              | Details                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| a = system name         | Same as printer name.<br><b>Values:</b> Up to 17 alphanumeric characters                                         |
| b = system contact      | Any contact information as desired (such as a name or phrase)<br><b>Values:</b> Up to 50 alphanumeric characters |
| c = system location     | The printer's model information.<br><b>Values:</b> Up to 50 alphanumeric characters                              |
| d = get community name  | <b>Values:</b> Up to 19 alphanumeric characters<br><b>Default:</b> public                                        |
| e = set community name  | <b>Values:</b> Up to 19 alphanumeric characters<br><b>Default:</b> public                                        |
| f = trap community name | <b>Values:</b> Up to 20 alphanumeric characters<br><b>Default:</b> public                                        |

## ^NP – Set Primary/Secondary Device

Use this command to specify whether to use the printer's or the print server's LAN/WLAN settings at boot time. The default is to use the printer's settings.

When the printer is set as the primary device, you can set it up using ZPL commands or the Wireless Setup Wizard utility, and any wired print server inserted into the printer will use those settings. The drawbacks to using the printer as primary are:

Any wired print server inserted into the printer will lose its original settings if the printer is set to check for the wired print server and the Primary Device is set to **PRINTER** (see [^NB on page 431](#)).

**Format:** ^NPa

| Parameters                   | Details                                                                   |
|------------------------------|---------------------------------------------------------------------------|
| a = device to use as primary | <b>Values:</b><br>P = printer<br>M = MPS/Printserver<br><b>Default:</b> P |

## ^NT – Set SMTP

Use this command to set the Simple Mail Transfer Protocol (SMTP) parameters. This allows you to set the e-mail settings for alerts.

**Format:** ^NTa,b

| Parameters              | Details                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = SMTP server address | <b>Values:</b> Any properly formatted server address in the <b>xxx.xxx.xxx.xxx</b> format                                                                                                                                          |
| b = print server domain | <b>Values:</b> Any properly formatted print server domain name. A domain name is one or more labels separated by a period ("dot"), and a label consists of letters, numbers, and hyphens. An example of a domain name is zebra.com |

## ^NW – Set Web Authentication Timeout Value

Use this command to set the timeout value for the printer home page. The printer will prompt for the printer password only the first time that certain screens are accessed until 1) the web authentication timeout value is reached (default value is 5 minutes) or 2) the printer is reset. At that time, the printer will prompt for the password again.

**Format:** ^Nw<sub>a</sub>

| Parameters               | Details                                                                                                                                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b> = timeout value | The timeout value in minutes for an IP address to be authenticated to the printer web pages.<br><b>Values:</b> 0 (no secure pages can be accessed without entering the printer password) to 255 minutes<br><b>Default:</b> 5 |

## ^WA – Set Antenna Parameters

Use this command to set the values for the receive and transmit antenna.

**Format:** ^WAa,b

| Parameters           | Details                                                                       |
|----------------------|-------------------------------------------------------------------------------|
| a = receive antenna  | <b>Values:</b><br>D = diversity<br>L = left<br>R = right<br><b>Default:</b> D |
| b = transmit antenna | <b>Values:</b><br>D = diversity<br>L = left<br>R = right<br><b>Default:</b> D |

## ^WE – Set WEP Mode

**Note** • The ^WE command is provided only for backward-compatibility with printers using firmware prior to V50.15.x, V53.15.x, or X60.15.x. For these firmware versions and later, use [^WX on page 448](#) to set the security type and related parameters.

Use this command to command enable Wired Equivalent Privacy (WEP) mode and set WEP values. WEP is a security protocol for wireless local area networks (WLANS).

Be careful to include the exact number of commas required for this command when setting encryption keys (parameters **e** through **h**). A missing or extra comma will cause the keys to be stored in the wrong slots and can prevent the printer from joining the wireless network.

**Format:** ^WEa,b,c,d,e,f,g,h

| Parameters                        | Details                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a</b> = encryption mode        | <p><b>Values:</b></p> <p><b>OFF</b><br/> <b>40</b> = 40-bit encryption<br/> <b>128</b> = 128-bit encryption</p> <p><b>Default:</b> OFF</p>                                                                                                                                                                                                                             |
| <b>b</b> = encryption index       | <p>Tells the printer which encryption key to use.</p> <p><b>Values:</b></p> <p><b>1</b> = Key 1<br/> <b>2</b> = Key 2<br/> <b>3</b> = Key 3<br/> <b>4</b> = Key 4</p> <p><b>Default:</b> 1</p>                                                                                                                                                                         |
| <b>c</b> = authentication type    | <p><b>Values:</b> O (Open System), S (Shared Key)</p> <p><b>O</b> = Open System<br/> <b>S</b> = Shared Key</p> <p><b>Default:</b> 0</p> <p> <b>Note</b> • If you enable Shared Key authentication with Encryption Mode set to <b>OFF</b>, this value resets to <b>O</b> (Open).</p> |
| <b>d</b> = encryption key storage | <p><b>Values:</b> H (Hex key storage), S (string key storage)</p> <p><b>H</b> = Hex key storage<br/> <b>S</b> = String key storage</p> <p><b>Default:</b> H</p>                                                                                                                                                                                                        |

| Parameters                                     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| e, f, g, h =<br>encryption keys<br>1 through 4 | <p><b>Values:</b> The actual value for the encryption key</p> <p>The encryption mode affects what can be entered for the encryption keys:</p> <ul style="list-style-type: none"> <li>For 40-bit, encryption keys can be set to any 5 hex pairs or any 10 alphanumeric characters.</li> <li>For 128-bit, encryption keys can be set to any 13 hex pairs or any 26 alphanumeric characters.</li> </ul> <p> <b>Note</b> • When using hex storage, do not add a leading 0x on the WEP key.</p> |

→ **Example 1:** This example sets encryption to 40-bit, activates encryption key 1, and sets encryption key 1 to the string **12345**.

`^WE40,,,12345`

In this example, the Encryption Index, Authentication Type, and Encryption Key Storage parameters are left blank with commas as placeholders for the fields. The printer uses the default values for these parameters.

→ **Example 2:** This example sets encryption to 128-bit, activates encryption key 2, and sets encryption keys 1 and 2 to hex values.

`^WE128,2,,H,12345678901234567890123456,98765432109876543210987654`

The value for encryption key 1 is stored and can be activated in the future by the following command:

`^WE128,1`

→ **Example 3:** This example sets encryption to 128-bit, activates encryption key 4, and sets encryption key 4 to a hex value.

`^WE128,4,,H,,,98765432109876543210987654`

Values are not required for encryption keys 1 through 3 when setting encryption key 4. In this example, commas are used as placeholders for the fields for encryption keys 1 through 3. Any previously stored values for these encryption keys do not change.

**Important** • Make sure that you include the exact number of commas required to get to the slot for encryption key 4 (parameter **h**).

## ^WI – Change Wireless Network Settings

Use this command to change the wireless network settings.

Zebra recommends using [^ND on page 307](#) for these settings if you have any of the following printers:

- Xi4 printers with firmware V53.17.1Z or later
- RXi4 printers with firmware V53.17.7Z or later
- ZM400, ZM600, or S4M printers with firmware V53.15.xZ or later
- RZ400/RZ600 printers with firmware R53.16.x or later

**Format:** ^WIA,b,c,d,e,f,g,h,i

| Parameters                      | Details                                                                                                                                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a = IP resolution               | <b>Values:</b><br><b>A</b> = All<br><b>B</b> = BOOTP<br><b>C</b> = DHCP and BOOTP<br><b>D</b> = DHCP<br><b>G</b> = Gleaning only (Not recommended when the Wireless Print Server or Wireless Plus Print Server is installed.)<br><b>R</b> = RARP<br><b>P</b> = Permanent<br><b>Default:</b> A |
| b = IP address                  | <b>Values:</b> Any properly formatted IP address in the xxx.xxx.xxx.xxx format.<br><b>Default:</b> 000.000.000.000                                                                                                                                                                            |
| c = subnet mask                 | <b>Values:</b> Any properly formatted subnet mask in the xxx.xxx.xxx.xxx format.<br><b>Default:</b> 000.000.000.000                                                                                                                                                                           |
| d = default gateway             | <b>Values:</b> Any properly formatted gateway in the xxx.xxx.xxx.xxx format.<br><b>Default:</b> 000.000.000.000                                                                                                                                                                               |
| e = WINS server address         | <b>Values:</b> Any properly formatted WINS server in the xxx.xxx.xxx.xxx format.<br><b>Default:</b> 000.000.000.000                                                                                                                                                                           |
| f = connection timeout checking | <b>Values:</b><br><b>Y</b> = yes<br><b>N</b> = no<br><b>Default:</b> Y                                                                                                                                                                                                                        |
| g = timeout value               | Time, in seconds, before the connection times out.<br><b>Values:</b> 0 through 9999<br><b>Default:</b> 300                                                                                                                                                                                    |
| h = ARP broadcast interval      | Time, in minutes, that the broadcast is sent to update the device's ARP cache.<br><b>Values:</b> 0 through 30<br><b>Default:</b> 0 (no ARP sent)                                                                                                                                              |

| Parameters                      | Details                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>i</b> = base raw port number | The port number that the printer should use for its RAW data.<br><b>Values:</b> 1 through 65535<br><b>Default:</b> 9100 |

## ^WL – Set LEAP Parameters

**Note** • The ^WL command is provided only for backward-compatibility with printers using firmware prior to V50.15.x or X60.15.x. For these firmware versions and later, use [^WX](#) on page 448 to set the security type and related parameters.

Use this command to enable Cisco® Lightweight Extensible Authentication Protocol (LEAP) mode and set parameters. LEAP is user authentication method that is available with some wireless radio cards.

**Format:** ^WL<sub>a</sub>,<sub>b</sub>,<sub>c</sub>

| Parameters           | Details                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------|
| <b>a</b> = mode      | <b>Values:</b> OFF, ON<br><b>Default:</b> OFF                                                    |
| <b>b</b> = user name | <b>Values:</b> Any 1 to 32 alphanumeric including special characters<br><b>Default:</b> user     |
| <b>c</b> = password  | <b>Values:</b> Any 1 to 32 alphanumeric including special characters<br><b>Default:</b> password |

## ~WL – Print Network Configuration Label

Generates a network configuration label (Figure 2).

**Format:** ~WL

Figure 2 • Network Configuration Label

| Wireless Print Server
