                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                       |  |                                                       |  |                  |                 |         |                 |              |                |           |  |          |             |                          |            |                    |             |                    |                 |                    |                |          |                   |           |                |            |              |           |               |               |  |          |             |                    |            |                    |             |                    |                 |                    |                |          |                   |           |                |            |              |           |               |          |               |            |             |            |                 |                |               |                   |             |          |                  |                     |                |          |       |          |          |         |        |         |        |         |          |         |         |         |                 |                |                 |                |              |           |            |        |          |           |          |         |            |         |               |         |            |          |           |            |              |                                         |  |

## ^WP – Set Wireless Password

**Note** • This command does not apply to the S4M.

Use this command to set the four-digit wireless password (not the same as the general printer password). If the wireless password is **0000**, the Wireless and Wireless Plus print servers run in an “unprotected” mode, which means that you do not need to enter the wireless password through the control panel to view or modify wireless settings.

If a wireless password is set, the values for the following parameters will not appear through the control panel until the wireless password is entered:

- MAC Address
- ESSID
- WLAN Security
- WEP Type
- WEP Index
- Reset Network

**Format:** ^WPa,b

| Parameters                | Details                                                  |
|---------------------------|----------------------------------------------------------|
| a = old wireless password | <b>Values:</b> 0000 through 9999<br><b>Default:</b> 0000 |
| b = new wireless password | <b>Values:</b> 0000 through 9999<br><b>Default:</b> 0000 |

## ^WR – Set Transmit Rate

Use this command to change the transmission rate for 802.11b wireless print servers.

**Format:** ^WRa,b,c,d,e

| Parameters         | Details                                                            |
|--------------------|--------------------------------------------------------------------|
| a = rate 1         | Sets the 1 Mb/s transmit rate.<br><b>Values:</b> Y (On), N (Off)   |
| b = rate 2         | Sets the 2 Mb/s transmit rate.<br><b>Values:</b> Y (On), N (Off)   |
| c = rate 5.5       | Sets the 5.5 Mb/s transmit rate.<br><b>Values:</b> Y (On), N (Off) |
| d = rate 11        | Sets the 11 Mb/s transmit rate.<br><b>Values:</b> Y (On), N (Off)  |
| e = transmit power | <b>Values:</b> 1, 5, 20, 30, 50, 100                               |

## ~WR – Reset Wireless Radio Card and Print Server

Use this command to reinitialize the wireless radio card and the print server (wired or wireless) when the Wireless or Wireless Plus print server is running. The command also causes any wireless radio card in the printer to reassociate to the wireless network.

**Format:** ~WR

## ^WS – Set Wireless Radio Card Values

Use this command to set the wireless radio card values for ESSID, Operating Mode, and Card Preamble.

**Format:** ^WSe,o,p,h,i,j,k

| Parameters                       | Details                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| e = ESSID value                  | <p><b>Values:</b> Any value up to 32 characters, including all ASCII and Extended ASCII characters, including the space character. When this parameter is left blank, the ESSID is not changed.</p> <p><b>Default:</b> 125</p>                                                                                                                                                                                                 |
| o = operating mode               | <p><b>Values:</b> I (Infrastructure), A (Adhoc)</p> <p><b>Default:</b> I</p>                                                                                                                                                                                                                                                                                                                                                   |
| p = wireless radio card preamble | <p><b>Values:</b></p> <p>L = long</p> <p>S = short</p> <p><b>Default:</b> L</p>                                                                                                                                                                                                                                                                                                                                                |
| h = wireless pulse               | <p>Adds a pulse to the network traffic generated by the printer. This pulse is necessary with some network configurations to keep the printer online.</p> <p><b>Values:</b></p> <p>0 = disabled</p> <p>1 = enabled</p> <p><b>Default:</b> 1</p> <p><span style="border: 1px solid blue; padding: 2px;">.15†</span> This parameter is supported in firmware version V60.15.x, V50.15.x, R6x.15.x, R53.15.x, ZSPx, or later.</p> |
| i = wireless pulse interval      | <p>Sets the interval at which the wireless pulse is sent when the wireless pulse feature is enabled.</p> <p><b>Values:</b> 5 to 300 seconds</p> <p><b>Default:</b> 15</p> <p><span style="border: 1px solid blue; padding: 2px;">.15†</span> This parameter is supported in firmware version V60.15.x, V50.15.x, R6x.15.x, R53.15.x, ZSPx, or later.</p>                                                                       |
| j = channel mask                 | <p>For commonly used channel masks, see <a href="#">Table 25</a>.</p> <p><b>Values:</b> 4 Hexadecimal digits preceded by “0x” (0x0000 to 0xFFFF)</p> <p><b>Default:</b> 0x7FF</p> <p><span style="border: 1px solid blue; padding: 2px;">.15†</span> This parameter is supported in firmware version X60.15.x, V50.15.x, or later.</p>                                                                                         |

| Parameters                                                                                                          | Details                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| k = international mode<br><br>.151<br>This parameter is supported in firmware version X60.15.x, V50.15.x, or later. | In international mode, the printer uses the channel set by the access point.<br><b>Values:</b> 0 (Disabled), 1 (Enabled)<br><b>Default:</b> 0 |

Table 25 • Channel Mask Settings

| Region                               | Channel Mask |
|--------------------------------------|--------------|
| United States, Canada, Latin America | 0x7FF        |
| Europe, Middle East, Africa, other   | 0x1FFF       |
| Japan                                | 0x3FFF       |

## ^WX – Configure Wireless Securities

Use this command to configure the wireless security settings for your printer. Values entered for this command must match what is configured on your WLAN and must be supported by the wireless radio card that you are using.

The ^WX command replaces individual ZPL commands for different security types.

**Note** • When using certificate files, your printer supports:

- Using Privacy Enhanced Mail (PEM) formatted certificate files.
- Using the client certificate and private key as two files, each downloaded separately.
- Using exportable PAC files for EAP-FAST.
- The supporting parameters that are required vary based on the security type that you select. See [Supporting Parameters for Different Security Types on page 451](#) for instructions for each security type.

**Important** • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.

**Format:** ^WXa,[zero or more supporting parameters]

| Parameters                | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| n = Pre-Shared Key (PSK) value*    | <p>Enter the PSK value. This value is calculated and must be the same for each device on the WLAN. Use ZebraNet Bridge to generate the PSK value. A value must be specified if using WPA PSK.</p> <p> <b>Important</b> • Do not enter a pass phrase for this field in this command. To use a pass phrase, use the ZebraNet Bridge Enterprise Wireless Setup Wizard.</p> <p><b>Values:</b> a minimum of 64 hexadecimal digits</p> <p><b>Default:</b> None</p> |

\* Not used for all security types

## Supporting Parameters for Different Security Types

The supporting parameters required for this command vary based on the security type that you select. You should not use all of the supporting parameters each time that you use this command, nor will you use extra commas to separate unused fields. Follow the example and format for your specific security type in this section, substituting your own wireless network data.

---

### Security Type 01: No Wireless Security Active

**Format** ^WX01

- **Example:** This example turns off all wireless securities controlled under this command, but it does not reset the printer's wireless settings to their defaults.

^XA  
^WX01  
^JUS^XZ

---

### Security Type 02: WEP 40-Bit

**Format** ^WX02,b,c,d,e,f,g,h

- **Example:** This example configures the printer for WEP 40-bit encryption using index key 1, open authentication, and a hexadecimal WEP key with a value of "A1B2C3D4F5."

^XA  
^WX02,1,0,H,A1B2C3D4F5,,,  
^JUS  
^XZ

---

### Security Type 03: WEP 128-Bit

**Format** ^WX03,b,c,d,e,f,g,h

- **Example:** This example configures the printer for WEP 128-bit encryption using index key 2, open authentication, and four hexadecimal WEP keys.

^XA  
^WX03,2,0,H,**001122334455667788,112233445566778899,2233445566778899  
900,334455667788990011**  
^JUS  
^XZ

## Security Type 04: EAP-TLS

**Format** ^WX04,k

- **Example:** This example configures the printer for EAP-TLS authentication with an optional private key password with a value of “**private**.”

```
^XA  
^WX04,private  
^JUS  
^XZ
```

---

## Security Type 05: EAP-TTLS

**Format** ^WX05,i,j

- **Example:** This example configures the printer for EAP-TTLS authentication, including a user ID of “**user**” and a password of “**password**.”

```
^XA  
^WX05,user,password  
^JUS  
^XZ
```

---

## Security Type 06: EAP-FAST

**Format** ^WX06,i,j,k

- **Example:** This example configures the printer for EAP-FAST authentication, including a user ID of “**user**,” a password of “**password**,” and an optional private key of “**private**.”

```
^XA  
^WX06,user,password,private  
^JUS  
^XZ
```

---

## Security Type 07: PEAP

**Format** ^WX07,i,j

- **Example:** This example configures the printer for PEAP authentication, including a user ID with a value of “user” and a password with a value of “password.”

```
^XA  
^WX07,user,password  
^JUS  
^XZ
```

---

## Security Type 08: LEAP

**Format** ^WX08,i,j

- **Example:** This example configures the printer for LEAP authentication, including a user ID with a value of “user” and a password with a value of “password.”

```
^XA  
^WX08,user,password  
^JUS  
^XZ
```

---

## Security Type 09: WPA PSK

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments (R6x15.x, R53.15.x, ZSPx, and later.)

**Format** ^WX09,n

- **Example:** This example configures the printer for WPA PSK authentication with a PSK value of all zeroes (64 hexadecimal digits).

```
^XA  
^WX09,00000000...  
^JUS  
^XZ
```

---

## Security Type 10: WPA EAP-TLS

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

**Format** ^WX10,k

→ **Example:** This example configures the printer for WPA EAP-TLS authentication with an optional private key password with a value of “**private**.”

```
^XA  
^WX10,private  
^JUS  
^XZ
```

---

## Security Type 11: WPA EAP-TTLS

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

**Format** ^WX11,i,j

→ **Example:** This example configures the printer for WPA EAP-TTLS authentication, including a user ID with a value of “**user**” and a password with a value of “**password**.”

```
^XA  
^WX11,user,password  
^JUS  
^XZ
```

---

## Security Type 12: WPA EAP-FAST

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

**Format** ^WX12,i,j,k

→ **Example:** This example configures the printer for WPA EAP-FAST authentication, including a user ID of “**user**,” a password of “**password**,” and an optional private key of “**private**.”

```
^XA  
^WX12,user,password,private  
^JUS  
^XZ
```

---

## Security Type 13: WPA PEAP

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

**Format** ^WX13,i,j

→ **Example:** This example configures the printer for WPA PEAP authentication, including a user ID with a value of “**user**” and a password with a value of “**password**.”

```
^XA  
^WX13,user,password  
^JUS  
^XZ
```

---

## Security Type 14: WPA LEAP

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

**Format** ^WX14,i,j

→ **Example:** This example configures the printer for WPA LEAP authentication, including a user ID with a value of “**user**” and a password with a value of “**password**.”

```
^XA  
^WX14,user,password  
^JUS  
^XZ
```

---

## Security Type 15: Kerberos

**Format** ^WX15,i,j,l,m

→ **Example:** This example configures the printer for Kerberos encryption, including a Kerberos user ID with a value of “**user**,” a Kerberos password with a value of “**password**,” a realm of “**zebra**,” and a KDC of “**krbtgt**.”

```
^XA  
^WX15,user,password,zebra,krbtgt  
^JUS  
^XZ
```

# ZBI Commands

This section explains the Zebra Basic Interpreter, its commands, descriptions, formats, and parameters.

## Introduction to Zebra Basic Interpreter (ZBI)

### What is ZBI and why is it for me?

ZBI is an "on-the-printer" programming language that offers many of the functions found in ANSI BASIC. The ZBI language allows the user to create applications that are run on the printer to manipulate data streams. By using ZBI, it is possible to have the printer perform the same functions that a computer or programmable terminal might otherwise be used for.

With the connectivity options available on Zebra printers, you may not need a separate computer. Simply load a ZBI program on your printers, add them to your network, and let the printers serve as the gateway for moving data.

Here are some of the applications that can be written using ZBI:

- Connect a barcode scanner to the printer. Based on scanned data, reprint tags, verify printed output, and manage a list of items.
- Connect a scale to the printer and print labels, tags, or receipts based on the weight of an item.
- Connect the printer to a PC-based database and send queries from the printer to retrieve or upload data.
- Convert incoming data into the commands that can be used to print a label. This is useful for replacing other brands of printers with new Zebra units.
- Provide fail-over to another printer when the target printer is in an error state.

### Printers, ZBI Keys, & ZBI Versions

Information about ZBI 1.x and ZBI 2.x:

**ZBI versions 1.0 through 1.5:** ZBI 1.x was available on printers with X.10 or higher firmware (such as V48.10.x). To determine if the printer supports ZBI version 1, check the firmware version loaded on the printer. This can be determined by the absence of a "Z" in the firmware version number (for example, firmware V60.13.0.12 supports ZBI version 1, while V60.13.0.12Z does not). The following printers support the ZBI 1.x firmware:

- *LP/TLP 284x-Z and 384x-Z*
- *S300/S400/S500/S600*
- *Z4000/Z6000*
- *Z4M/Z6M*
- *Z4Mplus/Z6Mplus*
- *105SL*
- *PAX3*
- *Xill*
- *Xilll*

ZBI-Developer can be used to create programs for use on printers that support ZBI version 1.x., however, the features that are only available in ZBI v2.x cannot be used with printers running ZBI v1.x. For example, “on-printer” debugging advanced file encryption and commands added in ZBI 2 are not supported in printers running ZBI 1.x. If you do not have a printer that meets this requirement, contact your reseller.

**Note** • Support for ZBI versions 1.0 through 1.5 is limited to syntax checking only. On-printer debugging is not supported for ZBI versions 1.0 through 1.5.

**ZBI versions 2.0 and higher:** Printers with firmware versions X.16 or later (for example, V60.16.x and V53.16.x) can support ZBI version 2.0 and later. The following printers support the ZBI 2.x firmware:

- *Xilll Plus*
- Z4Mplus/Z6Mplus
- 105SL
- S4M
- PAX4
- ZM400/ZM600, RZ400/RZ600
- G-Series
- HC100
- Xi4, RXi4
- LP/TLP2824+
- KR403

These printers can be either ZBI-Ready or ZBI-Enabled, depending on whether or not a ZBI Key file has been loaded on the printer. ZBI Keys can be loaded onto printers during manufacturing or later purchased at [www.zebrasoftware.com](http://www.zebrasoftware.com). A Downloader Utility/ZBI Key Manager software utility is available to assist in the task of sending ZBI Keys to printers.

The ZBI.nrd file is required to be present on the printer for ZBI 2.0 to be enabled. The ZBI Key is stored on the printer’s E: memory location with the name ZBI.nrd. The file is persistent. It cannot be deleted even if the printer’s memory is initialized. For example, if the ^JB command is used to initialize the location, the ZBI Key file will not be deleted.

When a printer is ZBI-Ready but not ZBI-Enabled, the firmware version will display a "Z" at the end of the version string (for example, V60.16.0Z). Additionally, the printer’s configuration label will show that the printer is not ZBI-Enabled.

When a printer is ZBI-Enabled, the firmware version will not display a "Z" at the end of the version string (for example, V60.16.0Z). Additionally, the printer’s configuration label will show that the printer is ZBI-Enabled.

**Note** • Each single ZBI Key can only be used once. When multiple printers are to be ZBI-Enabled multiple Keys will be needed. The ZBI Key cannot be retrieved from printer to a host system.

## Command and Function Reference Format

This section describes how commands and functions are presented in this document.

### Command/Function NAME

Describes how the command is used, its capabilities, and its characteristics.

**Format** The Format section explains how the command is arranged and its parameters. For example, the **AUTONUM** command starts the auto-numbering option. The format for the command is **AUTONUM <A>,<B>**. The **<A>** and **<B>** are parameters of this command and are replaced with values determined by the user.

For functions, parameters are enclosed within parentheses and separated by commas, such as **EXTRACT\$(A\$,START\$,STOP\$)**.

Numeric parameters are written as a name, while string parameters are written as a name followed by a dollar sign.

**Parameters** If a command has parameters that make a command or function more specific, they are listed under this heading. Still using the **AUTONUM** example, the **<A>** parameter is defined as:

**<A>** = number used to start the auto-numbering sequence

### Return Value (functions only)

The return value is the result of evaluating the function or expression.

**Example** When a command is best clarified in a programming context, an example of the ZBI code is provided. Text indicating parameters, exact code to be entered, or data returned from the host is printed in the **Courier** font to be easily recognizable.

**Example:** An example of **PRINT** code is:

```
10 PRINT "HELLO WORLD"  
RUN  
HELLO WORLD
```

**Comments** This section is reserved for notes that are of value to a programmer, warnings of potential command interactions, or command-specific information that should be taken into consideration. An example comment could be: This is a program command and must be preceded by a line number.

## Function Rules

Functions built into this interpreter can be used in expressions only. The function names are not case sensitive.

If input parameters exist, they are enclosed in parentheses. If no parameters exist, no parentheses are used.

Variables referenced in the functions could be substituted by functions or expressions of the same type. If the function name ends with a \$, it returns a string value. Otherwise, it returns a numeric value.

## Section Organization

The sections in this guide are arranged based on programming topics. A brief description of the sections is listed below.

**Editing Commands** This section describes the commands which are used to manipulate the interpreter and enter programs.

**Running and Debugging** Outlines the control commands used to run and debug programs.

**Base Types and Expressions** Fundamental structure for manipulating strings and computing numeric and boolean values.

**Control and Flow** Commands to conditionally execute code and control the flow of the program

**Input and Output** Outlines how to communicate with the physical ports, internal ports, and network.

**File System** Shows how programs and formats can be saved and recalled

**Comma Separated Values** Identifies how to load and store comma separated data

**Events** Explains how to capture and trigger internal events in the printer

**Systems** Contains miscellaneous systems interface functions

**String Functions** Handles string manipulation

**Math Functions** Handles mathematical calculations

**Array Functions** Describes how to search, resize, and query arrays

**Time and Date Functions** Functions to access the real time clock option

**Set/Get/Do Interface** Functions to directly interface with the Set/Get/Do system

**Example Programs** More examples to give a head start in creating your applications

## Writing ZBI Programs

There are two main ways to develop ZBI programs. The preferred method is to use the ZBI-Developer application. ZBI-Developer allows you to create and test programs before a printer is even turned on. In addition, many features of this program allow for quicker program creation and more meaningful debugging. ZBI-Developer can be downloaded from the Zebra web site.

An alternate method for developing a program is through a direct connection to the printer using a terminal emulation program.

## Editing Commands

This section details the Editing Commands. This section describes the commands which are used to manipulate the interpreter and enter programs. These commands are used while controlling the ZBI environment from a console connection. Here is a quick list of these commands:

**NEW** – Clears out the program and variables currently in memory

**REM and !** – Comment commands

**LIST** – Lists the program currently in memory

**AUTONUM** – Automatically generates the next line number

**RENUM** – Renumerates the program currently in memory

**ECHO** – Controls whether characters received on the console are echoed back

If you are using ZBI-Developer, the commands that will be most useful are AUTONUM and REM/!.

The following example shows the use of Editing commands from within a console connection.

### Preview:

```

    NEW
    AUTONUM 10,5
    Entered
    automatically
    when
    AUTONUM is
    used
    10 REM "Hello World" Application
    15 PRINT "Hello World" ! comment...
    20
    LIST
    10 REM "Hello World" Application
    15 PRINT "Hello World"
    NEW
    LIST
  
```

A blue bracket on the left side of the code highlights the line 'Entered automatically when AUTONUM is used'. A blue arrow points from this bracket to the text 'A blank line stops AUTONUM' on the right.

### Preview when viewed in ZBI-Developer

```

    AUTONUM 10,5
    REM "Hello World" Application
    PRINT "Hello World" ! comment...
  
```

## NEW

This command clears the interpreter's memory, including the line buffer and variables, but not any open ports. Use this command when creating code to restart the coding process or before resending a program from a file to the interpreter.

### Format NEW

### Parameters N/A

**Example:** This is an example of how to use the NEW command:

```
10 PRINT "Hello World"
```

```
RUN
```

```
Hello World
```

```
LIST
```

```
10 PRINT "Hello World"
```

```
NEW
```

```
LIST
```

**Comments** This is an interactive command that takes effect as soon as it is received by the printer.

## REM

A numbered **remark** line starts with **REM** and includes text in any form after it. This line is ignored by the interpreter.

**Format** **REM <comment>**

**Parameters** The comment string can contain any character and is terminated by a carriage return.

**Example 1:** This is an example of how to use the **REM** command:

```
10 REM COMMAND LINES 20-100 PRINT A LABEL
```

**Comments** Remarks are used for program description and are included as a separate program line. To append a comment to the end of a program line, use the exclamation mark (!).

A useful method to keep comments in a stored file (but not in the printer) is to always start the REM line with the number 1. When all of the lines are sent to the printer, only the last REM line will stay resident in the printer. This will require less RAM for large programs.

**Example 2:** This is an example of how to re-use the **REM** command:

```
1 REM MYPROGRAM COPYRIGHT ME Inc. 2008
1 REM While debugging a port may be left open
5 CLOSE ALL
1 REM Open the ports this program will use
10 OPEN #0: NAME: "SER" ! Restart the console
```

## ! (EXCLAMATION MARK)

The exclamation mark is the marker for adding comments to the end of numbered programming lines. Any text following the ! is ignored when the line or command is processed.

**Format** !<comment>

**Parameters** The comment string can contain any character and is terminated by the carriage return.

→ **Example:** This is an example of how to use the ! (comments) command:

**10 LET A=10 ! Indicates number of labels to print**

**Comments** None

# LIST

This command lists the program lines currently in memory.

## Format

```
LIST
LIST <A>
LIST <A>-<B>
```

## Parameters

**default** = lists all lines in memory  
**<A>** = line to start listing the program  
**<B>** = line to stop listing the program. If not specified, only the line at **<A>** will print.

**Example:** This is an example of how to use the LIST command:

```
1 REM MYPROGRAM COPYRIGHT ME Inc. 2008
1 REM While debugging a port may be left open
5 CLOSE ALL
1 rem Open the ports this program will use
10 OPEN #0: NAME: "SER" ! Restart the console
20 PRINT #0: "Hello World"
LIST
1 REM Open the ports this program will use
5 CLOSE ALL
10 OPEN #0: NAME: "SER" ! Restart the console
20 PRINT #0: "Hello World"

LIST 1
1 REM Open the ports this program will use

LIST 5-10
5 CLOSE ALL
10 OPEN #0: NAME: "SER" ! Restart the console
```

**Comments** The output of the LIST command may not match exactly what was entered. It is based on how the program lines are stored in memory. Notice that the last comment line the REM is entered in lower case characters. When it is listed, the REM is displayed in uppercase.

This is an interactive command that takes effect as soon as it is received by the printer.

## AUTONUM

This command automatically generates sequential program line numbers.

**Format** AUTONUM <A>,<B>

### Parameters

A = the number used to start the auto-numbering sequence  
B = the automatic increment between the new line numbers

→ **Example:** This example shows specifying the starting line number in the increment between new line number. Type the following at the prompt:

```
AUTONUM 10,5
SUB START
PRINT "HELLO WORLD"
GOTO START
```

```
LIST
```

Will produce:

```
AUTONUM 10,5
10 SUB START
15 PRINT "HELLO WORLD"
20 GOTO START
```

The three lines are automatically started with the **AUTONUM** parameters; in this case, the first line starts with 10 and each subsequent line increments by 5.

**Comments** This feature is disabled by overwriting the current line number and entering the desired interactive mode commands, or leaving the line blank.

Use of the **SUB** command allows for **GOTO** and **GOSUB** statements that do not require line numbers in your program.

This is an interactive command that takes effect as soon as it is received by the printer.

## RENUM

This command renumbers the lines of the program being edited. **RENUM** can reorganize code when line numbers become over- or under-spaced. The line references following **GOTO** and **GOSUB** statements are renumbered if they are constant numeric values. Renumbering does not occur if the line numbers are outside of the range limits of 1 to 10000.

**Format** **RENUM <A>,<B>**

### Parameters

<**A**> = the number to start the renumbering sequence

<**B**> = the automatic increment between the new line numbers

**Example:** This is an example of how to use the RENUM command:

```
LIST
13 LET A=6
15 LET B=10
17 GOTO 13
RENUM 10,5
LIST
10 LET A=6
15 LET B=10
20 GOTO 10
```

**Note** • The target of the GOTO command changes from 13 to 10 to reflect the renumbering.

**Comments** This is an interactive command that takes effect as soon as it is received by the printer.

## ECHO

When Console Mode is enabled, this command controls whether the printer echoes the characters back to the communications port. If **ECHO ON** is entered, keystroke results return to the screen. If **ECHO OFF** is entered, keystroke results do not return to the screen.

### Format

**ECHO ON**  
**ECHO OFF**

### Parameters

<ON/OFF> = toggles the ECHO command on or off

### Example N/A

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## Running and Debugging Commands

The following commands were written before the development of the ZBI-Developer application. With that application, and when using ZBI version 1, the following commands are essentially obsolete. However, for those who started developing ZBI applications before ZBI-Developer, the following reference will be helpful.

**RUN** – Starts executing the program currently in memory at the first line of the program

**CTRL-C** Sends an end-of-transmission character, **ETX**, to the console to terminate the ZBI program currently running.

**RESTART** – Starts executing the program currently in memory where it was last stopped

**STEP** – Executes one line of the program in memory where it was last stopped

**DEBUG** – This mode controls whether or not the TRACE and BREAK commands are processed

**TRACE** – Shows which lines have been executed and which variables have been changed

**BREAK** – Stops the currently running program

**ADDBREAK** – Adds a break to an existing line

**DELBREAK** – Deletes an existing break

**ZPL** Terminates and exits the ZBI environment.

This example shows many of the Running and Debug Commands in practice.

**Example:** Preview:

ZBI Program

```

10 PRINT "TEN"
20 PRINT "TWENTY"
30 PRINT "THIRTY"

```

RUN ← Runs the whole program

TEN

TWENTY

THIRTY

STEP ← Runs one line

TEN

RESTART ← Completes running the program  
where STEP left off

TWENTY

THIRTY

ADDBREAK 20 ← Adds a breakpoint  
on line 20

RUN

TEN

<Program Break> on line: 20

Turn Trace On

DEBUG ON

TRACE ON

RESTART

<TRACE> 20

TWENTY

<TRACE> 30

THIRTY

## RUN

This command executes the current program, starting with the lowest line number. The interpreter will continue to execute the program lines in order unless a control statement directs the flow to a different point. When a higher line number does not exist or the END command is processed, the RUN command will stop.

### Format RUN

### Parameters N/A

→ **Example:** This is an example of how to use the RUN command:

```
10 PRINT "ZBI"  
20 PRINT "Programming"  
RUN  
ZBI  
Programming  
  
15 END  
RUN  
ZBI
```

**Comments** Ports that are open when the application is activated will remain open after the application has terminated. Variables also remain after the application has terminated.

To execute programs when the printer is powered on, use the ^JI command in the Autoexec.zpl file.

This is an interactive command that takes effect as soon as it is received by the printer.

## CTRL-C

Sending an end-of-transmission character, **ETX** (3 in hex), to the console (port 0) terminates the ZBI program currently running.

**Format** N/A

**Parameters** N/A

**Example** N/A

**Comments** In most terminal programs, you terminate the program using the **Ctr1-C** key sequence. Another method is to store an ETX character in a file and have the terminal program send the file to the console port.

**Note** • It is not recommended to use **RESTART** after using a **CTRL-C** because a command may have been prematurely interrupted. Restarting will have an undefined result.

## RESTART

If a program was halted by a break point or the **BREAK** command, the **RESTART** command can be used to reactivate the program at the point it stopped. **RESTART** functions similar to **RUN**, except the program attempts to restart from the point where it was last terminated. It also works in conjunction with the **STEP** command, picking up where the **STEP** command ended.

**Format** **RESTART**

**Parameters** N/A

**Example:** An example of the **RESTART** command:

```
10 PRINT "TEN"  
20 PRINT "TWENTY"  
30 PRINT "THIRTY"  
RUN  
TEN  
TWENTY  
THIRTY  
  
STEP  
TEN  
  
RESTART  
TWENTY  
THIRTY  
  
ADDBREAK 20  
RUN  
TEN  
<Program Break> on Line: 20
```

```
DEBUG ON  
TRACE ON  
RESTART  
<TRACE> 20  
TWENTY  
<TRACE> 30  
THIRTY
```

**Comments** If the program has not been run or has finished, **RESTART** runs the program from the beginning.

This is an interactive command that takes effect as soon as it is received by the printer.

## STEP

If a program was stopped by a **BREAK** command, **STEP** attempts to execute the program one line from where it last ended. If the program has not been run or has been completed, this executes the lowest numbered line.

### Format STEP

#### Parameters N/A

**Example:** This is an example of how to use the **STEP** command:

```
10 PRINT "Hello World"  
20 Print "TWENTY"  
STEP  
Hello World
```

```
STEP  
TWENTY
```

**Comments** This is an interactive command that takes effect as soon as it is received by the printer.

## DEBUG

**DEBUG** enables and disables the **TRACE** and **BREAK** commands.

### Format

```
DEBUG ON  
DEBUG OFF
```

### Parameters

**ON** = turns the debug mode on enabling the **TRACE** and **BREAK** commands to be processed.

**OFF** = turns the debug mode off. This disables the **TRACE** mode and causes **BREAK** commands to be ignored.

**Example:** See *TRACE* on page 478 and *BREAK* on page 479.

**Comments** This command has no effect on the processing of break points in ZBI-Developer. It is recommended that you avoid using the **DEBUG** command when writing programs in the ZBI-Developer environment, instead use the Debug capabilities of ZBI-Developer.

## TRACE

This command enables you to debug an application by outputting the executed line numbers and changed variables to the console.

### Format

```
TRACE ON  
TRACE OFF
```

### Parameters

<ON/OFF> = controls whether **TRACE** is active (ON) or disabled (OFF).  
If **DEBUG** is activated and the **TRACE** command is on, trace details are displayed. When any variables are changed, the new value displays as follows:  
<**TRACE**> **Variable** = **New Value**  
Every line processed has its line number printed as follows:  
<**TRACE**> **Line Number**

**Example:** An example of **TRACE** command in use:

```
10 LET A=5  
20 GOTO 40  
30 PRINT "Error"  
40 PRINT A  
DEBUG ON  
TRACE ON  
RUN  
<TRACE> 10  
<TRACE> A=5  
<TRACE> 20  
<TRACE> 40  
5
```

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

It is recommended that you avoid using the **TRACE** command when writing programs in the ZBI-Developer environment, instead use the Debug capabilities of ZBI-Developer.

## BREAK

This command allows you to stop the program when the program reaches this line.

**Format** **BREAK**

**Parameters** N/A

**Example:** An example of BREAK command in use:

```
10 LET A=5
20 BREAK
30 PRINT A
DEBUG ON
TRACE ON
RUN
<TRACE> 10
<TRACE> A=5
<TRACE> 20
<USER BREAK>
```

**Comments** This command is available only when the **DEBUG** function has been activated. When **DEBUG** is on, **BREAK** halts processing. **RUN** starts the program from the beginning. **RESTART** allows the program to continue from where it left off.

When using ZBI-Developer, this command will interfere with the debugging operations built into the application.

This is a program command that must be preceded by a line number.

## ADDBREAK

**Description** This command allows you to stop the program when the program reaches a specified line.

**Format** ADDBREAK <A>

### Parameters

A = the line number to break on. If the number specified is not in the program, the program will not break.

**Example:** An example of the ADDBREAK command.

```
10 LET A=5
20 PRINT A
ADDBREAK 20
RUN
<PROGRAM BREAK> ON LINE:20
```

RESTART

5

**Comments** This command is available only when the DEBUG function has been activated. When DEBUG is on, BREAK halts processing. RUN starts the program from the beginning. RESTART allows the program to continue from where it left off.

This is the command used internally by ZBI-Developer when the user right-clicks over a program line and adds a Breakpoint via the "Toggle Breakpoint" selection.

It is the recommended method for setting breakpoints in ZBI.

A maximum of 16 breakpoints can be set in an application.

This is an interactive command that takes effect as soon as it is received by the printer.

## DELBREAK

This command allows you to remove existing breakpoints.

**Format** DELBREAK <A>

**Parameters** A = the line number from which to remove the break. If 0 is specified, all break points will be removed. If the number specified is not a breakpoint, the command will have no effect.

**Example:** An example of the DELBREAK command:

```
10 LET A=5
20 PRINT A
ADDBREAK 20
DEBUG ON
TRACE ON
RUN
<TRACE> 10
<TRACE> A=5
<PROGRAM BREAK> ON LINE:20

RESTART
<TRACE> 20
5

DELBREAK 20
RUN
<TRACE> 10
<TRACE> A=5
<TRACE> 20
5
```

**Comments** This command is available only when the DEBUG function has been activated. When DEBUG is on, BREAK halts processing, RUN starts the program from the beginning, and RESTART allows the program to continue where it left off.

This is the command used internally by ZBI-Developer when the user right-clicks over a program line and removes a Breakpoint via the "Toggle Breakpoint" selection.

A maximum of 16 breakpoints can be set in an application.

This is an interactive command that takes effect as soon as it is received by the printer.

## ZPL

This command terminates and exits the ZBI environment.

**Format** ZPL

**Parameters** N/A

**Example:** An example of the ZPL command.

ZPL

*ZBI TERMINATED*

**Comments** This is an interactive command that takes effect as soon as it is received by the printer.

## Base Types and Expressions

There are two base types in the ZBI language. These types are Integers and Strings. Integers are whole numbers that contain no fractional part. The range of values for integers is:

-2,147,483,648 to +2,147,483,647

Strings are character arrays. The string length is only limited by the amount of memory in the system (version 2.0 and higher). Each character can have a value between 0 and 255 (version 2.0 and higher).

The use of control characters (0-31) may be difficult to debug based on the handling of control characters in different communications programs. In addition the ETX (3) will terminate a ZBI application when it is received on the console port. Use the CHR\$ function when control characters must be placed into strings.

**Note** • In ZBI version 1.4 and lower, there was a string length limit of 255 characters.

This section is organized as follows:

- Variable Names
- Variable Declarations
- Constants
- Arrays
- Assignment
- Numeric Expressions
- String Concatenation (&)
- Sub-strings
- Boolean Expressions
- Combined Boolean Expressions

### Variable Names

To distinguish strings from integers, string variable names must end in a \$. Variable names must start with a letter and can include any sequence of letters, digits, and underscores. Function and command names must not be used as a variable name. Variable names are not case sensitive and are converted to uppercase by the interpreter.

A common mistake is to use a command or function name as a variable. To avoid using these reserved words, ZBI-Developer can be a useful resource. Reserved words are highlighted making it easier to spot this occurrence and thus, saving debugging time.

#### Valid variable names:

I, J, K, VARNAME, VARSTR\$, MYSTR\$, MY\_STR9\$

#### Invalid Names:

STR\$ = Reserved word

ORD = Reserved word

VAL = Reserved word

W# = Invalid character (# )

9THSTR = Variable can not start with a number

## Variable Declarations

ZBI will allow storage of up to 255 variables. If more variables are needed, consider using arrays to store data. The base array will take up one of the 255 variable slots, but it can be declared to allow for many indices.

Variables can be declared explicitly or implicitly. If a variable has not been used before, it will be declared when used. The default value for an integer will be zero and the default value of a string will be an empty string.

### Explicit:

```
DECLARE NUMERIC <variable_name>
DECLARE STRING <variable_name$>
```

If the variable existed before the DECLARE statement, it will be defaulted.

### Implicit:

```
LET <variable_name> = NUMERIC EXPRESSION
LET <variable_name$> = STRING EXPRESSION
```

The Interpreter is limited to 255 variables. If more variables are required, consider using arrays.

## Constants

Integers are represented simply by numbers, such as 5, -10, 10000. Do not use commas in integer constants. Strings are enclosed by quotes. If a quote is required in the string, use double quotes, such as "Look here->""<" would result in the string – Look here->"<-.

## Arrays

An array is a collection of string or integer values used by a program. Array indices are accessed through parentheses. Array indices start at 1 and end at the length of an array (for example, MyArray(3) returns the value in the third location of the variable array). One- and two-dimensional arrays are allowed. Two-dimensional arrays are referenced with two indices in parentheses, separated by a comma.

Arrays must be allocated through the use of the **DECLARE** command. Arrays can be re-dimensioned by using **DECLARE**, however, this will replace the original array.

Array size is limited only by the size of the memory available.

### Format

```
DECLARE STRING <ARRAYNAME$>(<SIZE>)
```

```
DECLARE STRING <ARRAYNAME$>(<ROWS>,<COLUMNS>)
```

```
DECLARE NUMERIC <ARRAYNAME>(<SIZE>)
DECLARE NUMERIC <ARRAYNAME>(<ROWS>,<COLUMNS>)
```

### Parameters

<SIZE> = number of entries in a single dimension array  
 <ROWS> = number of rows in a two dimensional array  
 <COLUMNS> = number of columns in a two dimensional array

→ **Example:** An example of ARRAY code is:

```
10 DECLARE STRING INARRAY$(3)
20 FOR I = 1 TO 3
30 PRINT "Name "; I; ":" ;
40 INPUT INARRAY$(I)
50 NEXT I
60 PRINT INARRAY$(1); ", "; INARRAY$(2); ", and "; INARRAY$(3);
70 PRINT " went to the park"
RUN
Name 1: Jim
Name 2: Jose
Name 3: Jack
Jim, Jose, and Jack went to the park
```

**Comments** If you attempt to access an array outside of its allocated bounds, an error will occur.

## Assignment

All lines must start with a command. In order to assign a value to a variable, use the LET command. Multiple variables can be placed before the =. The variable types must match the expression type.

The right side of the assignment is always calculated completely before the assignment is made. This allows a variable to be the target and source of the assignment.

When a value is assigned to a string variable with a sub-string qualifier, it replaces the value of the sub-string qualifier. The length of the value of the string variable may change as a result of this replacement.

→ **Example:** An ASSIGNMENT example:

```
10 LET A=5
20 LET B$="HELLO"
30 LET B$(5:5)=B$
```

## LET

The LET command is used to assign value to a specific variable. The expression is evaluated and assigned to each variable in the variable list. See [Assignment on page 485](#).

### Format

`LET <variable> [,<variable>]* = <expression>`

The variable types must match the expression type or an error message will be displayed.

**Error: Poorly formed expression.**

When a value is assigned to a string variable with a sub-string qualifier, it replaces the value of the sub-string qualifier. The length of the value of the string variable may change as a result of this replacement.

### Parameters N/A

**Example:** This is an example of how to use the `LET` command:

```
10 LET A$= "1234"
15 LET A$(2:3)= "55" ! A$ NOW = 1554
20 LET A$(2:3)= "" ! A$ NOW = 14

10 LET A$= "1234"
15 LET A$(2:3)= A$(1:2) ! A$ NOW = 1124

10 LET A$= "1234"
15 LET A$(2:1)= "5" ! A$ NOW = 15234
```

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## Numeric Expressions

A base numerical expression can be either a constant, variable, or another numerical expression enclosed in parentheses. The five types used (addition, subtraction, multiplication, division, and exponentiation) are listed below. When evaluating an expression exceeding the maximum or minimum values at any point creates an undefined result. (maximum value: 2,147,487,647; minimum value: -2,147,483,648)

Floating point is not supported.

When using division, the number is always rounded down. For example,  $5/2=2$ . Use `MOD` to determine the remainder.

### Format

1. + (addition) Addition expressions use this format:

`<A>+<B>`

`5+2 result = 7`

`VAL ("25") +2 result =27`

2. – (subtraction) Subtraction expressions use this format:

<A>-<B>  
5-2 result = 3  
VAL ("25") -2 result =23

3. \* (multiplication) Multiplication expressions use this format:

<A>\*<B>  
5\*2 result = 10  
VAL ("25") \*2 result =50

4. / (division) Division expressions use this format:

<A>/<B>  
5/2 result = 2  
VAL ("25") /2 result =12

5. ^ (exponentiation) Exponentiation expressions use this format:

<A>^<B>  
5^2 result = 25  
VAL ("25") ^2 result =625

## Order of Precedence

In mathematics, the order of precedence describes the sequence that items in an expression are processed. All expressions have a predefined order of precedence.

The order of precedence is listed below:

---

Functions

---

Parenthetical Expressions ()

---

^

---

\* and /

---

+ and -

---

The \* and / have the same precedence, and the + and - have the same precedence. Items with the same order of precedence are processed from left to right.

For example, this expression  $5+(8+2)/5$  is processed as  $8+2=10$ , followed by  $10/5=2$ , then  $5+2$  to give a result of 7.

Functions and parenthetical expressions always have the highest order of precedence, meaning that they are processed first.

## String Concatenation (&)

The basic string expression may be either a constant or a variable, and concatenation (&) is supported. Using the concatenation operator (&) adds the second string to the first string.

<A\$> & <B\$>

**Example:** This is an example of how to use the STRING CONCATENATION (&) command:

```
10 LET A$= "ZBI-"  
20 LET B$= "Programming"  
30 LET C$= A$ & B$  
40 PRINT C$  
RUN  
ZBI-Programming
```

## Sub-strings

Using a sub-string operator on a string allows a specific portion of the string to be accessed. This portion may be the target of an assignment operation or a reference to a portion of the string. To determine the coordinates of the string portion to be used, count the characters from the beginning to the end of the string, including spaces.

### Format

```
LET <STRVAR$>(<A>:<B>)=<C$>  
LET <C$> = <STRVAR$>(<A>:<B>)
```

### Parameters

<A> = the position of the first character in the desired string

<B> = the position of the last character in the desired string.

<STRVAR\$> = base string variable

If the A parameter is less than 1, it is automatically assigned a value of 1. Because the string is calculated starting with 1, the A parameter cannot be less than 1.

If B is greater than the length of the string, it is replaced with the length of the string.

If A is greater than B, a NULL string (" "), which points to the location of the smaller of A or the end of the string, is returned. This is used when adding a string in the middle of another string without removing a character.

**Example 1:** This is an example of a sub-string reference:

```
LET A$="Zebra Quality Printers"
LET B$=A$(1:13)
PRINT B$
Zebra Quality
```

This is an example of a sub-string assignment.

```
LET A$= "1234"
LET A$(2:3)= "55" ! A$ NOW = 1554
LET A$(2:3)= "" ! A$ NOW = 14

LET A$= "1234"
LET A$(2:3)= A$(1:2) ! A$ NOW = 1124

LET A$= "1234"
LET A$(2:1)= "5" ! A$ NOW = 15234
```

The best way to think of assignment to a sub-string is as follows: an assignment is like selecting a word, and pasting over the selection with the new string.

## Boolean Expressions

A Boolean expression holds 0 (zero) as false and non-zero as true.

### Formats

```
<STRING EXPRESSION> <BOOLEAN COMPARE> <STRING EXPRESSION>
<NUMERIC EXPRESSION> <BOOLEAN COMPARE> <NUMERIC EXPRESSION>
NOT(<BOOLEAN EXPRESSION>)
```

### Parameters

<STRING EXPRESSION> = a string variable, string constant or any combination with concatenation  
 <NUMERIC EXPRESSION> = any mathematical operation

**Comments** A numeric expression cannot be compared to a string expression.

Numeric expressions can substitute a Boolean expression where a value of 0 (zero) represents false and a non-zero value represents true.

Base Boolean expressions:

1. < (less than)

| Expression | Result |
|------------|--------|
| 1< 2       | true   |
| 2<2        | false  |
| 2<1        | false  |

2.  $\leq$  (less than or equal to)

| Expression | Result |
|------------|--------|
| $1 \leq 2$ | true   |
| $2 \leq 2$ | true   |
| $2 \leq 1$ | false  |

3.  $>$  (greater than)

| Expression | Result |
|------------|--------|
| $1 > 2$    | false  |
| $2 > 2$    | false  |
| $2 > 1$    | true   |

4.  $\geq$  (greater than or equal to)

| Expression | Result |
|------------|--------|
| $1 \geq 2$ | false  |
| $2 \geq 2$ | true   |
| $2 \geq 1$ | true   |

5.  $=$  (equal to)

| Expression   | Result |
|--------------|--------|
| $1 = 2$      | false  |
| $2 = 2$      | true   |
| $"A" = "AA"$ | false  |
| $"A" = "A"$  | true   |

6.  $\neq$  (not equal to)

| Expression      | Result |
|-----------------|--------|
| $1 \neq 2$      | true   |
| $2 \neq 2$      | false  |
| $"A" \neq "AA"$ | true   |
| $"A" \neq "A"$  | false  |

## Combined Boolean Expressions

**AND**, **OR**, and **NOT** can be used in conjunction with base Boolean expressions to recreate expanded Boolean expressions.

1. **NOT** — Negate the target expression.

| Expression            | Result |
|-----------------------|--------|
| <b>NOT</b> <b>1=2</b> | true   |
| <b>NOT</b> <b>1=1</b> | false  |

2. **AND** — Both expressions must be true for a true result.

| Expression         | Result |
|--------------------|--------|
| <b>1=2 AND 1=2</b> | false  |
| <b>2=2 AND 1=2</b> | false  |
| <b>1=2 AND 2=2</b> | false  |
| <b>2=2 AND 2=2</b> | true   |

3. **OR** — If either expression is true, the result will be true.

| Expression        | Result |
|-------------------|--------|
| <b>1=2 OR 1=2</b> | false  |
| <b>1=2 OR 2=2</b> | true   |
| <b>2=2 OR 1=2</b> | true   |
| <b>2=2 OR 2=2</b> | true   |

## Order of Precedence

The order of precedence is listed below:

|                              |
|------------------------------|
| Expressions and Functions    |
| Parenthetical expressions () |
| <, <=, <>, =, =>, >          |
| <b>NOT, AND, OR</b>          |

## Control and Flow

This section outlines the commands to conditionally execute code and control the flow of the program. Here is a quick list of these commands:

**IF Statements** Executes or skips a sequence of statements, depending on the value of a Boolean expression.

**DO Loops** Repeats instructions based on the results of a comparison.

**FOR Loops** A control flow statement which allows code to be executed iteratively.

**GOTO/GOSUB** Causes an unconditional jump or transfer of control from one point in a program to another.

**SUB** Allows you to “substitute” names instead of actual line numbers as the target of **GOSUBs** and **GOTOs**.

**EXIT** Used to exit the **DO** and **FOR** loops.

**END** Terminates any program currently running.

# IF Statements

If the value of the <Boolean expression> in an **IF** statement is true and a program line follows the keyword **THEN**, this program line is executed. If the value of the Boolean expression is false and a program line follows the keyword **ELSE**, this program line is executed. If **ELSE** is not present, then execution continues in sequence, with the line following the **END IF** statement.

Nesting of blocks is permitted, subject to the same nesting constraints as **DO-LOOPs** (no overlapping blocks).

**ELSE IF** statements are treated as an **ELSE** line followed by an **IF** line, with the exception that the **ELSE IF** shares the **END IF** line of the original **IF** statement.

## Format

```
IF <Boolean expression> THEN
~~BODY~~
[ELSE IF <Boolean expression> THEN
~~BODY~~]*
[ELSE
~~BODY~~]
END IF
```

## Parameters N/A

**Example:** This is an example of how to use the **IF** statement command:

```
10 IF A$="0" THEN
20 PRINT "ZBI IS FUN"
30 ELSE IF A$="1" THEN
40 PRINT "ZBI IS EASY"
50 ELSE IF TIME=1 THEN
60 PRINT "It is one second past midnight"
70 ELSE
80 PRINT "X=0"
90 END IF
```

## DO Loops

Processing of the loop is controlled by a <WHILE/UNTIL> expression located on the DO or LOOP line.

Processing a WHILE statement is the same on either the DO or LOOP lines. The Boolean expression is evaluated and if the statement is true, the LOOP continues at the line after the DO statement. Otherwise, the line after the corresponding LOOP is the next line to be processed.

Processing an UNTIL statement is the same on either the DO or LOOP lines. The Boolean expression is evaluated and if the statement is false, the LOOP continues at the line after the DO statement. Otherwise, the line after the corresponding LOOP is the next to be processed.

If <WHILE/UNTIL> is on the LOOP line, the BODY of the loop is executed before the Boolean expression is evaluated.

If neither the DO or LOOP line has a <WHILE/UNTIL> statement, the loop continues indefinitely.

Some notes about DO-LOOPS:

- can be nested
- cannot overlap
- have two formats

### Format

```
DO [<WHILE/UNTIL> <Boolean expression>]  
~~BODY~~  
LOOP [<WHILE/UNTIL> <Boolean expression>]
```

**Example:** This is an example of how to use the DO-LOOP command with the conditional on the DO line:

```
10 DO WHILE A$="70"  
20 INPUT A$  
30 LOOP
```

**Example:** This is an example of how to use the DO UNTIL LOOP command with conditional on the LOOP line:

```
10 DO  
20 INPUT A$  
30 LOOP UNTIL A$="EXIT"
```

**Comments** This is a program command that is preceded by a line number.

# FOR Loops

**FOR** loops are an easy way to iterate through a range of values and run a body of code for each value iterated.

## Format

```
FOR <I> = <A> TO <B> [STEP <C>]
~~BODY~~
NEXT <I>
```

## Parameters

- <I> = indicates a numeric variable is used. <I> increments each time through the **FOR-LOOP**.
- <A> = the value assigned to <I> the first time through the loop
- <B> = the last value through the loop
- <C> = (Optional) the amount <I> increments each time through the loop
- Values of I for the following situations:

| Statement            | Result                          |
|----------------------|---------------------------------|
| FOR I=1 TO 10        | {1, 2, 3, 4, 5, 6, 7, 8, 9, 10} |
| FOR I=10 TO 1        | {10, 9, 8, 7, 6, 5, 4, 3, 2, 1} |
| FOR I=1 TO 10 STEP 2 | {1, 3, 5, 7, 9}                 |
| FOR I=10 TO 1 STEP 2 | {10, 8, 6, 4, 2}                |
| FOR I=10 TO 1 STEP 2 | { } FOR LOOP skipped            |

**Example:** This is an example of how to use the **FOR LOOP** command:

```
10 FOR X=1 TO 10 STEP 1
20 PRINT X; ":ZBI IS FUN"
30 NEXT X
```

**Comments** **FOR** loops can be nested but cannot overlap. Variables cannot be reused by the nested loops.

## GOTO/GOSUB

**GOSUB** is followed by a line number. The program will attempt to process the line the **GOSUB** command points to rather than the next line of the program. Upon executing the **GOSUB** statement, the interpreter continues running at the line number specified following **GOSUB**. If the line number referenced does not exist, an error will occur.

Before executing the next line, the **GOSUB** command stores the line number of the **GOSUB** line. When the **RETURN** statement is called, the program moves back to the next line following the **GOSUB**.

Executing a **RETURN** statement without a corresponding **GOSUB** statement causes an error.

**GOSUB** statements can be nested.

**GOTO** works the same way as **GOSUB** except that no return address will be stored.

### Format

```
GOSUB <A>
RETURN
GOTO <A>
```

**Parameters** <A> = the program location executed immediately after the **GOTO** or **GOSUB**.

**Example:** This is an example of how to use the **GOSUB** command:

```
10 PRINT "Call Subroutine"
20 GOSUB 1000
30 PRINT "Returned from Subroutine"
40 END
1000 PRINT "In Subroutine"
1010 RETURN
```

**Example:** This is an example of how to use the **GOTO** command:

```
10 PRINT "Prepare to Jump!"
20 GOTO 1000
30 PRINT "Jump Missed..."
1000 PRINT "Jump Successful"
1010 END
```

**Comments** These are program commands and must be preceded by line numbers.

# SUB

This command allows you to use names instead of actual line numbers as the target of **GOSUBs** and **GOTOs**. **AUTONUM** can be used at the beginning of a file and there is no need to compute the line number where the jump will go.

**Format 10 SUB <A>**

**Parameters** <A> = the integer variable to use as a target for the **GOTO/GOSUB**

→ **Example:** This is an example of how to use the **SUB** command:

```
AUTONUM 1,1
GOSUB INITCOMM
DO
GOSUB GETINPUT
GOSUB PROCESSINPUT
LOOP
SUB INITCOMM
OPEN #1:NAME "SER"
RETURN
SUB GETINPUT
INPUT #1: A$
RETURN
SUB PROCESSINPUT
PRINT A$
RETURN
```

**Comments** <A> is a numeric variable. If this variable is changed in the program, any **GOSUB/GOTO** to this variable may fail.

## EXIT

This command is used to exit the **DO** and **FOR** loops.

### Format

```
EXIT DO  
EXIT FOR
```

**Parameters** The specified loop type is exited. For the **DO** command, the program will continue execution on the line following the next **LOOP**. Likewise for the **FOR** command, the program will continue on the line after the next **NEXT** command.

**Example** N/A

**Comments** This is a program command that is preceded by a line number. To be explicit and reduce errors, it is recommended to use **GOTO** instead of **EXIT**.

## END

The **END** command terminates any program currently running. When the **END** command is received, the interpreter returns to interpreting commands (>).

### Format END

### Parameters N/A

**Example:** This is an example of how to use the **END** command:

```
10 PRINT "THIS PROGRAM WILL TERMINATE"
20 PRINT "WHEN THE END COMMAND IS RECEIVED"
30 END
40 PRINT "THIS SHOULD NOT PRINT"
RUN
THIS PROGRAM WILL TERMINATE
WHEN THE END COMMAND IS RECEIVED
```

**Comments** This is a program command and is preceded by a line number.

## Input and Output

This section outlines how to communicate with physical ports, internal ports, and the network.

ZBI allows access to the physical and network connections in the printer. Most ports are, by default, connected to the ZPL processor. When a port is opened in ZBI, the port will be disconnected from ZPL and connected into the interpreter. Depending on the type of connection, there are two methods you may use to start the connection. For the static connections, the **OPEN** command should be used. These are the connections that you open when starting your program and leave open for the duration of your program. For dynamic connections, servers and clients are set up following the "Sockets" model. On servers, the actual connections are started upon successful calls to **ACCEPT**. Below are the available connections that can be made and the preferred accessors.

## Available Ports

| Port/Connection | ZBI Name         | Preferred Access Commands/Functions      |
|-----------------|------------------|------------------------------------------|
| Serial          | "SER"            | OPEN, CLOSE                              |
| Parallel        | "PAR"            | OPEN, CLOSE                              |
| USB             | "USB"            | OPEN, CLOSE                              |
| ZPL parser      | "ZPL"            | OPEN, CLOSE                              |
| TCP Server      | "TCP",<br>"TCPX" | SERVERSOCKET, SERVERCLOSE, ACCEPT, CLOSE |
| TCP Client      | "TCP"            | CLIENTSOCKET, CLOSE                      |
| UDP Server      | "UDP"            | SERVERSOCKET, SERVERCLOSE, ACCEPT, CLOSE |
| UDP Client      | "UDP"            | CLIENTSOCKET, CLOSE                      |
| Email Sender    | "EML"            | OPEN, CLOSE                              |
| Bluetooth       | "BLU"            | OPEN, CLOSE                              |

Note: TCPx will not work on PS2 or PS100 print servers.

## Creating Connections

Here is a quick list of the commands in this section:

**OPEN** Opens a port for transmitting and receiving data.

**CLOSE** Closes specific ports that are in use.

**DATAREADY** Determines if there is data received on a specified port.

**SERVERSOCKET** Opens a listening socket for incoming UDP packets or TCP connections.

**SERVERCLOSE** Closes a listening server socket.

**CLIENTSOCKET** Creates an outgoing TCP connection or sets up UDP transmissions.

**ACCEPT** Accepts incoming TCP or UDP connections and assigns a channel for the connection.

## OPEN

This command is used to open a port for transmitting and receiving data.

**Format** OPEN #<CHANNEL>: NAME <PORT\$>

### Parameters

<CHANNEL> = a number to use as a handle to the port for all future communications

**Values:** 0 to 9

**Default:** a port must be specified

<PORT\$> = port name to open. See *Available Ports on page 500*.

**Example:** This is an example of how to use the OPEN command:

```
10 OPEN #1: NAME "ZPL"
```

The port being opened no longer allows data to pass directly into its buffer, it disconnects, and the interpreter now controls the data flow.

Data already in the buffer stays in the buffer.

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## CLOSE

This command is implemented to close specific ports that are in use. If a port is open on a channel and the **CLOSE** command is entered, the port closes and returns to communicating with the ZPL buffer.

### Format

```
CLOSE #<A>  
CLOSE ALL
```

### Parameters

<A> = Numeric value of port to close

**Values:** 0 through 9

**All** = closes all open ports and network connections

**Note** • **CLOSE ALL** will close the console.

**Example:** This example shows the closing of channel 1:

```
10 CLOSE #1
```

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## DATAREADY

This function is used to determine if there is data received on a specified port.

**Format** DATAREADY (A)

**Parameters** A = the port to check

**Returns** 1 if there is data, 0 if there is no data.

**Example:** This is an example of how to check if there is a data on a port:

```
10 PRINT DATAREADY(0)  
RUN
```

The result, assuming no data is waiting, is:

0

**Comments** If this command follows the INPUT command, it may return 1 if the line received was ended with a CRLF. In this case, INBYTE can be used to take the LF out of the buffer.

# SERVERSOCKET

This function opens a listening socket for incoming UDP packets or TCP connections. It must be used in conjunction with the **ACCEPT** function.

**Format** **SERVERSOCKET** (**TYPE\$**,**PORT**)

## Parameters

**TYPE\$** = listens for any of the following communication protocols:

"TCP" = TCP – PORT parameter is ignored. The current port will be used.

"TCPX" = TCP – any open port

"UDP" = UDP – any open port

**Returns** **NUMERIC** = returns the handle of the server upon success.

**Example:** See the examples for *TCP Server* [on page 520](#) and *UDP Server* [on page 522](#).

**Comments** When using **TCPX**, care needs to be taken not to use a port that is already open on the printer. No error message will be returned until the **ACCEPT** function is called.

## SERVERCLOSE

This function closes a listening server socket created by SERVERSOCKET.

**Format** SERVERCLOSE(SOCKET)

### Parameters

**SOCKET** = the socket handle returned from a successful SERVERSOCKET invocation.

**Returns** Returns a 0 if the socket was already closed or a 1 if the socket was closed successfully.

**Example:** This example shows how to close a listening server socket.

```
10 LET SERVER_HANDLE = SERVERSOCKET("TCPX", 19100)
20 LET SCERR = SERVERCLOSE(SERVER_HANDLE)
```

# CLIENTSOCKET

This function creates an outgoing TCP connection or sets up UDP transmissions. Once set up for UDP, packets can be sent by printing to the socket. Packets are sent when the size limit is met or a **EOT** character is written.

**Format** `CLIENTSOCKET (TYPE$, IPADDR$, PORT)`

## Parameters

**TYPE\$** = set to "UDP" or "TCP".

**IPADDR\$** = connects to this address.

**PORT** = connects to this IP port.

**Returns** The port number assigned to the connection.

**Example:** See the examples for *TCP Server* [on page 520](#) and *UDP Server* [on page 522](#).

**Comments** Multiple communications connections can be made up to the maximum of 10. Each protocol may have a different limit based on the support of the print server used. Test the worst case situation based on your application's needs or use **ONERROR** to recover from failed connection attempts.

## ACCEPT

This function will accept incoming TCP or UDP connections and assign a channel for the connection. **SERVERSOCKET** must be used to set up the listening socket before **ACCEPT** can be used.

**Format** **ACCEPT (SERVER, CLIENT\_INFO\$)**

### Parameters

**SERVER** = the handle returned by the **SERVERSOCKET** call.

**CLIENT\_INFO\$** = string variable will have the connecting client's IP address and port separated by a space when using UDP.

**Returns** The channel number to use to communicate with the client.

**Example:** See the examples for *TCP Server* [on page 520](#) and *UDP Server* [on page 522](#).

**Comments** It is best to poll this function at regular intervals. When there is no connection waiting, this function will trigger an error. Follow this function with the **ON ERROR** command to divert to a section of code that handles an unsuccessful connection.

**ACCEPT** can be called before closing a previous connection. This allows for processing multiple incoming streams of data. There are limits on the number of simultaneous incoming connections based on the print server model on the printer.

Connection closure can be detected when any input or output command to the port triggers an error. These commands should be followed by an **ON ERROR** statement to send the program into a recovery state and to shutdown the connection cleanly.

## Reading and Writing

This manual has detailed various functions to read and write to all of the ports. The following section gives an overview of the commands, functions, and when each should be used.

To start, it is important to understand the term "blocking". In communications code, a function or command is "blocking" if it waits for all of the requested data to be received before it returns.

**INPUT (blocking)** Reads one line into each string specified.

**PRINT (blocking)** Simple method to write specified expressions out.

**OUTBYTE (blocking)** Writes one byte out.

**INBYTE (blocking)** Reads in one byte.

**READ (non-blocking)** Reads in all available data up to the maximum amount specified.

**WRITE (non-blocking)** Writes out as much data as possible up to a maximum specified amount.

**SEARCHTO\$ (blocking)** Reads in data (does not keep) until a search parameter is found.  
Non-matching data can be redirected to another port.

# INPUT

If the variable is numeric and the value entered cannot be converted to a number, it writes as 0. This operation scans the data from left to right, shifting any number into the variable. It ignores any non-numeric character except the return character, which terminates the input, or Ctrl-C (^C) which terminates the program. The variable can be in string or numeric form.

## Format

```
INPUT [<CHANNEL>:] <A$> [,<B$>]*
INPUT [<CHANNEL>:] <A>[,<B>]*
```

If the [<channel>:] is omitted, the default port, 0, will be used.

## Parameters

<CHANNEL> = read data from this port. Default = 0.

<A, B, . . . , N> = variables to write.

When using multiple variables as targets, a corresponding number of lines are read.

String and numeric variables can be intermixed.

**Example:** This is an example of how to use the INPUT command:

```
10 OPEN #1: NAME "ZPL"
20 PRINT #1: "~HS"
30 FOR I = 1 TO 3
40 INPUT #1: A$
50 PRINT A$
60 NEXT I
```

In this example, a host status prints to the console after submitting the host status request ~HS to the ZPL port. The Input/Output command of the ZBI interpreter is limited to the communications ports. File I/O is not supported.

INPUT ends processing a line with a CR or LF. This leads to a tricky situation. There are many ways different systems end a line: CR, CRLF, LF. If the ZBI program only uses INPUT, the next execution of the INPUT command will remove the extra LF or CR, in case of LFCR. However, if the program instead uses INBYTE, DATAREADY or the other commands, the extra LF will show up on the port. Here's a simple workaround to explicitly look for the CRLF that is in use:

```
SEARCHTO(<PORT>,CHR$(13)&CHR$(10),<INSTRING$>)
```

**Note** • The INPUT command does not accept control characters or the delete character. If these characters need to be processed, use the READ command.

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

If an invalid port is specified, **Error: Invalid port** is returned.

**Example:** This shows the input command reading in multiple lines.

```
10 INPUT A$,B,C,D$,E$
```

Five lines would be read in: 3 strings and 2 numbers.

## PRINT

This command sends data to the printer to be printed.

**Format** PRINT [CHANNEL:] <expression> [,or; <expression>]\* [;]

### Parameters

<CHANNEL> = write data to this port  
<expression> = the value to write

The expression can be either a string or a numeric expression.  
Using a , to separate expressions adds a space between them.  
Using a ; to separate expressions does not put a space between them.  
Using a ; at the end of a line ends the print statement without adding a new line (CR/LF).

**Example:** This is an example of how to use the PRINT command:

```
10 LET A$ = "This is an example"  
20 LET B$ = "of the PRINT Command."  
30 PRINT A$, B$ ! adds a space between expressions  
40 PRINT A$; B$ ! no space added  
RUN
```

The result is:

*This is an example of the PRINT Command.  
This is an example of the PRINT Command.*

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## OUTBYTE

This command outputs a byte to a port.

### Format

```
OUTBYTE [<CHANNEL>:] <A>
OUTBYTE [<CHANNEL>:] <A$>
```

### Parameters

<CHANNEL> = sends the byte to this port. Default = 0.

<A> = This is a numeric expression.

**Values:** 0 through 255. If it is not within that range, it is truncated.

<A\$> = This is the string expression. The first character is used. In the case of a NULL string, 0 is sent.

**Example:** This is an example of how to use the OUTBYTE command:

```
LET A$="Hello"
```

```
OUTBYTE A$
```

This would only print the H character to the console.

```
OUTBYTE 4
```

This would print the control character **EOT** to the console. See an ASCII table for a list of the control characters.

**Comments** This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## INBYTE

This command forces the interpreter to pause until data is available. Use the **DATAREADY** function to determine if there is data on the port.

### Format

```
INBYTE [<CHANNEL>:] <A>  
INBYTE [<CHANNEL>:] <A$>
```

### Parameters

<CHANNEL> = reads from this port. Default = 0.

<A> = integer value is set to the byte received.

<A\$> = A single byte string is created with the byte received. The first character is used. In the case of a NULL string, 0 is sent.

**Example:** This is an example of how to use the INBYTE to create an echo program:

```
10 INBYTE A$ !Takes one byte (char) from port #0  
20 PRINT A$ !Prints the character to the console  
30 GOTO 10
```

In this example, the interpreter pauses until the data is entered, then continues processing. This command enters all bytes in a string or integer, including control codes.

**Comments** INBYTE will block until a byte is received on the specified port. This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## READ

**Description** This is a non-blocking input function. It will read in all of the bytes available on the specified port.

**Format** READ (<CHANNEL>, <A>, <MAXBYTES>)

### Parameters

<CHANNEL> = reads from this port. Default = 0.  
<A\$> = the string where the data will be placed  
<MAXBYTES> = the maximum number of bytes to read

**Returns** The number of bytes read.

**Example:** This is an example of the READ command:

```
1 CLOSE ALL
2 LET INPORT = CLIENTSOCKET("TCP","192.168.0.1",9100)
3 ON ERROR GOTO RECOVERY
4 LET WATERMARK = 5000
5 DO WHILE 1
6 IF LEN(DATA$) < WATERMARK THEN
7 LET BYTESREAD = READ(INPORT,DATA$,500)
8 ON ERROR GOTO RECOVERY
9 END IF
10 IF (LEN(DATA$) > 0) THEN
11 LET BYTES_WRITTEN = WRITE(INPORT,DATA$,LEN(DATA$))
12 ON ERROR GOTO RECOVERY
13 LET DATA$(1,BYTES_WRITTEN) = ""
14 END IF
15 IF BYTESREAD = 0 AND BYTESWRITTEN = 0 THEN
16 SLEEP 1 ! DON'T BOMBARD IF IDLE
17 END IF
18 LOOP
19 SUB RECOVERY
20 CLOSE #INPORT
```

## WRITE

ZBI  
2.01

**Description** This is a non-blocking output function. It will write as many bytes as the output buffer can hold.

**Format** `WRITE (<CHANNEL>, <A>, <BYTES>)`

### Parameters

<**CHANNEL**> = reads from this port. Default = 0.  
<**A\$**> = the string to write out.  
<**MAXBYTES**> = The number of bytes to write

**Returns** The number of bytes written.

**Example:** This is an example of `WRITE` command:

```
1 CLOSE ALL
2 LET INPORT = CLIENTSOCKET("TCP", "192.168.0.1", 9100)
3 ON ERROR GOTO RECOVERY
4 LET WATERMARK = 5000
5 DO WHILE 1
6 IF LEN(DATA$) < WATERMARK THEN
7 LET BYTESREAD = READ(INPORT, DATA$, 500)
8 ON ERROR GOTO RECOVERY
9 END IF
10 IF (LEN(DATA$) > 0) THEN
11 LET BYTES_WRITTEN = WRITE(INPORT, DATA$, LEN(DATA$))
12 ON ERROR GOTO RECOVERY
13 LET DATA$(1, BYTES_WRITTEN) = ""
14 END IF
15 IF BYTESREAD = 0 AND BYTESWRITTEN = 0 THEN
16 SLEEP 1 ! DON'T BOMBARD IF IDLE
17 END IF
18 LOOP
19 SUB RECOVERY
20 CLOSE #INPORT
```

## SEARCHTO\$

This function performs a search until a specified string is found. The string the search yields is displayed.

### Format

```
SEARCHTO$(A,B$)
SEARCHTO$(A,B$,C)
SEARCHTO$(A$,B$)
SEARCHTO$(A$,B$,C$)
```

### Parameters

A = port number (0 to 9) to which requested data is sent  
A\$ = string to search for B\$  
B\$ = string variable or string array. If B\$ is an array, this command searches for all non-null strings in the B\$ array.  
C = a port in which the input is directed until B\$ is found  
C\$ = a string in which the characters in A\$ are directed until B\$ is found

**Returns** The string found.

**Example:** This example shows how to use **SEARCHTO** to find a string on a port:

```
10 OPEN #1: NAME "SER"
20 LET A$ = SEARCHTO$(1,"^XA")
30 PRINT "FOUND:", A$
```

**Example:** This example shows how to search for an array of strings:

```
10 OPEN #1: NAME "SER"
20 DECLARE STRING FIND$(3)
30 LET FIND$(1) = "ONE"
40 LET FIND$(2) = "TWO"
50 LET FIND$(3) = "THREE"
60 LET A$ = SEARCHTO$(1,FIND$)
70 PRINT "FOUND:", A$
```

**Example:** This example shows unused data routed to a port.

```
10 OPEN #1: NAME "PAR"
20 OPEN #2: NAME "SER"
30 DECLARE STRING FIND$(3)
40 LET FIND$(1) = "ONE"
50 LET FIND$(2) = "TWO"
60 LET FIND$(3) = "THREE"
70 LET A$ = SEARCHTO$(1,FIND$,2)
80 PRINT "FOUND:", A$
```

**Example:** This example shows how to use **SEARCHTO** to find a string within a string and direct the unused part of the string to another string:

```
10 LET A$ = "The faster you go, the shorter you are - Einstein"
20 LET B$ = SEARCHTO$(A$,"you", C$)
30 PRINT "FOUND:", B$
40 PRINT "DISCARDED:", C$
```

**Comments** **SEARCHTO** will block (wait) until the search string is found. If you want to be able to run other code while doing something similar, consider using **READ** with **POS**.

When using **SEARCHTO** with ports, it will block (wait) until the search string is found. If you want to be able to run other code while doing something similar, consider using **READ** to place data into a string. That string can be passed to **SEARCHTO** for processing.

## Port Usage Examples

Before diving into the syntax of all the commands, let's look at some simple applications using the different features of the communications systems in ZBI.

### Physical Ports (Serial, Parallel, USB, Bluetooth®)

Though the types of devices interacting with the printer's ports may vary greatly, internal to the printer, the ports are all handled in the same way. These ports are opened with the ZBI **OPEN** command and closed with the ZBI **CLOSE** command. When one of these ports is opened, it is disconnected from the ZPL parser and any data in the buffer will be redirected to the ZBI environment.

→ **Example:** In the following example, "SER" could be replaced by "PAR", "USB", or "BLU" depending on the application.

```
10 CLOSE ALL
20 LET IMPORT = 1
25 SLEEP 1
30 OPEN #IMPORT: NAME "SER"
35 ON ERROR GOTO 25
40 PRINT #IMPORT: "Enter your name:";
50 INPUT #IMPORT: YOURNAME$
55 ON ERROR GOTO 70
60 PRINT #IMPORT: "You entered: "; YOURNAME$
70 CLOSE #IMPORT
```

## ZPL Parser

To make a ZBI program print, it is necessary to create a connection from the program to the ZPL parser on the printer. The connection will function in the same way as a connection to a physical port, except that the connection will not automatically terminate. The ZPL parser in the printer can handle many incoming connections simultaneously. For example, a ZBI program could take control of the serial port and send label formats to the ZPL parser, while the parallel port (unopened by ZBI) could also be used to send label formats directly into the parser.

**Note** • The ZPL parser will lock onto one port once a format is started (via the ^XA command). So, in some cases, it is desirable to start and stop your communications to ZPL in one continuous sequence.

Another use of ZBI is to check printer status, while another application prints to another port.

→ **Example:** Here is how that can be done:

```
10 OPEN #1: NAME "ZPL"
20 PRINT #1: "~HS"
30 FOR I = 1 TO 3
40 INPUT #1: A$
50 PRINT A$
60 NEXT I
```

## TCP Client

There are two methods for making a TCP connection to another server. The first method uses the **OPEN** command while the second method uses the **CLIENTSOCKET** method.

**CLIENTSOCKET** is the preferred method.

**Example:** The following example demonstrates this method:

```
10 CLOSE ALL
20 LET IMPORT = CLIENTSOCKET("TCP","192.168.0.1",9100)
40 LET OUTSTR$ = "REQUESTING SERVER NAME";
50 DO WHILE (LEN(OUTSTR$) > 0)
60 LET BYTES_WRITTEN = WRITE(IMPORT,OUTSTR$,LEN(OUTSTR$))
70 ON ERROR GOTO RECOVERY
80 LET OUTSTR$ = OUTSTR$(1+BYTES_WRITTEN:LEN(OUTSTR$))
90 LOOP
100 INPUT #IMPORT: YOURNAME$
110 PRINT #IMPORT: "Server returned: "; YOURNAME$
120 CLOSE #IMPORT
130 SUB RECOVERY
140 END
```

## TCP Server

Setting up a listening server in the printer can be accomplished with the **SERVERSOCKET** function. To connect to incoming TCP sessions, use the **ACCEPT** function.

When starting the application, call **SERVERSOCKET**. This function will create a handle for this listening server. Check for incoming connections at regular intervals with the **ACCEPT** function. If there are no pending sessions, the **ACCEPT** function will return with an error. Handle the error using the **ON ERROR** command and continue looking for other sessions later.

Depending on how the program is set up, it is possible to handle one or more sessions at a time. If the program is configured to allow only one session, the other connections will remain pending until they are shut down by the requesting client or the ZBI program connects them.

**Example:** Here is an example of the **SERVERSOCKET** and **ACCEPT** commands:

```
10 CLOSE ALL
20 LET SERVER_HANDLE = SERVERSOCKET("TCPX",19100)
30 REM There are no connections yet we are just listening for them
40 REM Lets loop until we get a connection
50 SLEEP 1
60 LET IMPORT = ACCEPT(SERVER_HANDLE,CLIENT_INFO$)
70 ON ERROR GOTO 50
80 PRINT #IMPORT: "You have successfully connected!"
90 PRINT #IMPORT: "Login:";
100 INPUT #IMPORT: LOGIN$
110 PRINT #IMPORT: "Password:";
120 INPUT #IMPORT: PASSWORD$
130 REM We will not be nice and reject the connection
130 PRINT #IMPORT: "Login failed"
140 CLOSE #IMPORT
150 GOTO 60 ! Go look for the next connection
160 END
```

## UDP Client

There are also two methods for making a UDP connection to another server. The first method uses the **OPEN** command, while the second method uses the **CLIENTSOCKET** method. UDP is a one way communication medium, thus, you can only use output commands. Because UDP is connectionless, the output will be queued up until an **EOT** character is written or the maximum packet size is exceeded. Once the **EOT** character is written, the packet is formatted and sent.

With UDP, it is important to be careful about understanding what the network being used will support.

In many cases, there will be a limit to the size of the packet that can be used, typically between 1000 and 1500 bytes, but some networks cut this down into the 500 to 600 byte range. To be safe, keep your packets less than 500 bytes.

UDP does not guarantee transmission. See UDP specifications for more details.

**Example:** Since **CLIENTSOCKET** is the preferred method, an example is shown below.

```
10 CLOSE ALL
20 LET INPORT = CLIENTSOCKET("UDP", "192.168.0.1", 22222)
30 LET EOT$ = CHR$(4)
40 PRINT #INPORT: "Packet #"; I; EOT$;
50 LET I = I + 1
60 SLEEP 1
70 GOTO 40
```

## UDP Server

Setting up a listening server in the printer can be accomplished with the **SERVERSOCKET** function. Then, to connect to incoming UDP packets, use the function **ACCEPT**. When starting your application, call **SERVERSOCKET**. This function will create a handle for this listening server. Check for incoming packets at a regular interval with the **ACCEPT** function. If there are no pending sessions, the **ACCEPT** function will return with an error. Just handle the error using the **ON ERROR** command and continue looking for other sessions later. You will need to call **ACCEPT** for each incoming packet. When the accept is successful, all of the data will be available. Call **READ** with a **MAX** string size of 2000 and you will have the whole packet in your string. Close the port and wait for the next packet. You can only read in data using a UDP server.

**Example:** Here is an example of how to set up to receive UDP messages:

```
10 CLOSE ALL
20 LET ZPLPORT = 1
35 OPEN #ZPLPORT: NAME "ZPL"
40 LET SERVER_HANDLE = SERVERSOCKET("UDP",33333)
50 REM There are no connections yet: listening
60 REM Let's loop until we get a connection
70 SLEEP 1
80 LET INPORT = ACCEPT(SERVER_HANDLE,CLIENT_INFO$)
90 IF INPORT = -1 THEN
92 GOTO 70
94 END IF
100 LET PACKET_SIZE = READ(INPORT,PACKET$,2000)
110 PRINT #ZPLPORT: "^XA^F0100,100^A0N,40,40^FDPACKET FROM:";
115 PRINT #ZPLPORT: CLIENT_INFO$; "^FS"
120 PRINT #ZPLPORT: "^F0100,150^A0N,40,40^FDPACKET SIZE:";
125 PRINT #ZPLPORT: PACKET_SIZE; "^FS"
130 PRINT #ZPLPORT: "^F0100,200^A0N,40,40^FDPACKET DATA:";
135 PRINT #ZPLPORT: PACKET$; "^FS^XZ"
140 CLOSE #INPORT
150 GOTO 60 ! go look for the next connection
160 END
```

## E-mail

ZBI can be used to enhance the printer's ability to send status via e-mail messages. The process is simple: open the email port "EML", send the recipient list, send the header, and send the body of the message.

The printer can only process a limited number of outgoing email messages at one time. For this reason, error handling should be used when opening the connection to wait for the printer to be ready to send the message. The EOT character is important for delimiting sections of the email message. If it is left out, the message will not be sent properly.

Before the following code will work, the email settings for the print server must be set up. Consult the print server manual to learn how to configure the unit.

**Example:** Here is an example of how to send e-mails:

```
1 REM EOT$ this is used to denote end of transmission
5 LET EOT$ = CHR$(4)
1 REM Open a connection to the e-mail port and if it errors
1 REM try again until complete
10 OPEN #1: NAME "EML"
15 ON ERROR GOTO 10
1 REM Specify address to send message to then end signal end
1 REM of recipients with EOT$
1 REM To send to multiple addressees separate addressees by
1 REM space
20 PRINT #1: "youraddress@yourdomain.com";EOT$;
1 REM Fill in the message information
30 PRINT #1: "From: HAL"
40 PRINT #1: "To: Dave"
50 PRINT #1: "Subject: A message from HAL"
60 PRINT #1: ""
70 PRINT #1: "Dave, I am sorry I can not let you do that."
80 PRINT #1: i
1 REM Terminate message
90 PRINT #1: "";EOT$
1 REM You must close the port, each open port is only good
1 REM for sending one message
100 CLOSE #1
```

## File System

This section shows how programs and formats can be saved and recalled. Here's a quick list of these commands:

**STORE** Saves the program currently in memory as the specified file name.

**LOAD** Transfers a program file previously stored in the printer's memory and opens it in the ZBI Program Memory.

**DIR** With no filter included, prompts the printer to list all of the ZBI programs residing in all printer memory locations.

**DELETE** Removes a specified file from the printer's memory.

## Runtime Access

The following example is a method to store runtime data in the printer memory. The file system in the printer is limited to writing one file at a time. Since only one component of the printer can have write access to the file system, the ZPL parser is the component with this access. For ZBI to use the ZPL parser as a gateway into printer memory, the ZPL comment command (^FX) is used.

### Example:

```
AUTONUM 1,1
REM ***** TEST FOR SUBROUTINES *****
LET ZPLPORT = 1 OPEN #ZPLPORT: NAME "ZPL"
LET SIZE = 5
LET FILENAME$ = "R:TESTSYS.ZPL"
DECLARE STRING DATAIN$(SIZE)
LET DATAIN$(1) = "ONE"
LET DATAIN$(2) = "TWO"
LET DATAIN$(3) = "THREE"
LET DATAIN$(4) = "FOUR"
LET DATAIN$(5) = "FIVE"
GOSUB STOREDATA
GOSUB GETDATA
FOR I = 1 TO SIZE
IF DATAIN$(I) <> DATAOUT$(I) THEN
PRINT #ZPLPORT: "^XA^FO100,100^A0N,50,50^FDERROR:";
PRINT #ZPLPORT: DATAOUT$(I);"^XZ"
END IF
NEXT I
END
REM **** SUBROUTINE STOREDATA *****
REM INPUT: ZPLPORT, DATAIN$, SIZE, FILENAME$ *****
SUB STOREDATA
PRINT #ZPLPORT: "^XA^DF" & FILENAME$ & "^FS"
PRINT #ZPLPORT: "^FX"; SIZE; "^FS"
FOR I = 1 TO SIZE
PRINT #ZPLPORT: "^FX" & DATAIN$(I) & "^FS"
NEXT I
PRINT #ZPLPORT: "^XZ"
RETURN
REM **** SUBROUTINE GETDATA - *****
REM INPUT: ZPLPORT, FILENAME$ *****
REM ** OUTPUT: DECLares AND FILLS DATAOUT$ AND FILLS SIZE
SUB GETDATA
PRINT #ZPLPORT: "^XA^HF" & FILENAME$ & "^XZ"
SLEEP 1
LET RESULT$ = ""
FOR J = 1 TO 25
LET A = READ(ZPLPORT,TEMP$,5000)
LET RESULT$ = RESULT$ & TEMP$
IF POS(RESULT$,"^XZ") <> 0 THEN
EXIT FOR
END IF
SLEEP 1
NEXT J
LET RESULT$(1:POS(RESULT$,"^FX")+2) = ""
LET SIZE = VAL(EXTRACT$(RESULT$,"","",""))
DECLARE STRING DATAOUT$(SIZE)
FOR I = 1 TO SIZE
LET RESULT$(1:POS(RESULT$,"^FX")+2) = ""
LET DATAOUT$(I) = EXTRACT$(RESULT$,"","","")
NEXT I
LET RESULT$ = ""
LET TEMP$ = ""
RETURN
```

## STORE

This command saves the program currently in memory as the specified file name. The format listed below is used.

**Format** **STORE <filename\$>**

**Parameters** **<filename\$>** = the name of the file to be stored. Drive location and file name must be in quotation marks.

**Example:** This is an example of how to use the **STORE** command:

```
STORE "E:PROGRAM1.BAS"
```

**Comments** For a file name to be valid, it must conform to the 8.3 Rule: each file must have no more than eight characters in the file name and have a three-character extension. Here the extension is always **.BAS** (for example, **MAXIMUM8.BAS**).

This is an interactive command that takes effect as soon as it is received by the printer.

The ZBI-Developer IDE will take care of this for you with the **SEND TO** option on your program.

## LOAD

This command transfers a program file previously stored in the printer's memory and opens it in the ZBI Program Memory.

If the program file does not exist, the ZBI Program Memory is cleared and no program is opened.

**Format** LOAD <filename\$>

**Parameters** <filename\$> = the file name to be loaded into memory. Drive location and file name must be in quotation marks. If the drive location is not specified, all drives will be searched.

**Example:** Here are examples of how to use the LOAD command:

```
LOAD "PROGRAM1.BAS"  
LOAD "E:PROGRAM1.BAS"
```

**Comments** This is an interactive command that takes effect as soon as it is received by the printer.

## DIR

This command, with no filter included, prompts the printer to list all of the ZBI programs residing in all printer memory locations.

Including a filter signals the printer to limit the search; including a drive location signals the printer to search in only one location.

Asterisks (\*) are used as wild cards. A wild card (\*) finds every incidence of a particular request. The example here, **DIR "B:\*.BAS"**, signals the printer to search for every file with a **.BAS** extension in B: memory.

**Format** **DIR [<filter\$>]**

**Parameters** **[<filter\$>]** = the name of the file to be accessed (optional). Drive location and file name must be in quotation marks.

Default = **"\*:\*.bas"**

**Important** • Quotes must be around what you are doing. This shows you how to use the wildcard (\*) to search for all **.BAS** files in **B:** memory:

**Example** N/A

**Comments** This is an interactive command that takes effect as soon as it is received by the printer.

## DELETE

This command removes a specified file from the printer's memory.

**Format** `DELETE <filename$>`

**Parameters** `<filename$>` = the name of the file to be deleted. Drive location and filename must be in quotation marks.

→ **Example:** This is an example of deleting a specified file from printer memory:

```
DELETE "E:PROGRAM1.BAS"
```

**Comments** This is an interactive command that takes effect as soon as it is received by the printer.

## Comma Separated Values (CSV)

### Accessing Comma Separated Value (CSV) and Text File Functions

This section describes the functions to access CSV files and ASCII plain-text files. Here is a quick list of these commands:

**CSVLOAD** Loads the contents of a CSV file in a two dimensional string array.

**CSVSTORE** Stores the contents of a two dimensional string array in a CSV file.

**TXTLOAD** Loads the contents of an ASCII plain-text file into a string variable.

**TXTSTORE** Stores the contents of a string variable in an ASCII plain text file.

# CSVLOAD

This function will load the delimited values from a CSV file, defined by **FILENAME\$**, and store them in the two-dimensional array, **DEST\$**.

## Format

```
CSVLOAD(DEST$, FILENAME$)
CSVLOAD(DEST$, FILENAME$, DELIM$)
```

## Parameters

**DEST\$** = two dimensional array that will hold the rows and columns from the CSV file specified by the **FILENAME\$** variable. If there is not enough room in **DEST\$**, or if it has the wrong size, it will be changed to fit the data from the file. The data originally in **DEST\$** will be overwritten.

**FILENAME\$** = name of the file to load. Drive location and file name must be in quotation marks. The file extension must be either ".CSV" or ".TXT".

**DELIM\$** = optional delimiter that is used in the CSV file instead of a comma. If **DELIM\$** is not provided a comma will be used by default. The delimiter must be a single character that is not a quote, carriage return, or newline.

**Returns** The number of elements in each row of the CSV file. The function will return 0 if errors were detected in the CSV file, or if the file could not be read.

**Example:** This example shows how to print the values in a CSV file with a comma delimiter.

```
10 DECLARE STRING CSVDB$(1,2)
20 LET FILENAME$ = "E:RECORDS.CSV"
30 LET NUMOFCOLS = CSVLOAD(CSVDB$, FILENAME$)
40 LET NUMOFROWS = ROWSIZE(CSVDB$)
100 FOR I = 1 TO NUMOFROWS STEP 1
110     FOR J = 1 TO NUMOFCOLS STEP 1
120         PRINT CSVDB$(I, J), " ";
200     NEXT J
210     PRINT ""
300 NEXT I
```

→ **Example:** This example shows how to print the values in a CSV file that uses a '|' as a delimiter.

```
10  DECLARE STRING CSVDB$(1,2)
20  LET FILENAME$ = "E:EMPLOYEE.CSV"
30  LET NUMOFCOLS = CSVLOAD(CSVDB$, FILENAME$, "|")
40  LET NUMOFROWS = ROWSIZE(CSVDB$)
100 FOR I = 1 TO NUMOFROWS STEP 1
110      FOR J = 1 TO NUMOFCOLS STEP 1
120          PRINT CSVDB$(I, J), " ";
200      NEXT J
210      PRINT ""
300 NEXT I
```

**Comments** The maximum CSV file size supported will vary based upon available RAM within the printer.

### CSV File Information

The file format should follow the rules in IETF RFC 4180: <http://tools.ietf.org/html/rfc4180>

The maximum number of columns per row in a CSV file is 256.

Each row must be 2048 characters or less including the delimiter. The carriage return/line feed (CRLF) does not count toward the limit.

Each row in the CSV file must have the same number of elements. If there are any missing elements in the CSV file (indicated by two adjacent commas or a comma at the end of a row), they will be represented as empty strings.

If an element in the CSV file contains a quote, it should be represented as two quotes. Additionally, if an element contains a quote, a new line, a carriage return, or the delimiter character, the element must be within quotes. For example, a value that is used to store a measurement in feet and inches (4' 5") must be formatted as "4' 5"" within the CSV file.

# CSVSTORE

This function will store the values of a two dimensional array into a CSV file on the file system. Each element within the array is treated as a single value within the CSV file.

## Format

```
CSVSTORE(SRC$, FILENAME$)
CSVSTORE(SRC$, FILENAME$, DELIM$)
```

## Parameters

**SRC\$** = two dimensional array of strings to be written to a CSV file.

**FILENAME\$** = name of the file to store the array contents. Drive location and file name must be in quotation marks. The file extension must be either ".CSV" or ".TXT".

**DELIM\$** = optional delimiter that is used in the CSV file instead of a comma. If **DELIM\$** is not provided a comma will be used by default. The delimiter must be a single character that is not a quote, carriage return, or newline.

**Returns** A 0 if there were no errors. A 1 is returned if **SRC\$** is not a string array, if the file could not be written, or if **SRC\$** contains errors that prevent the file from being stored.

**Example:** This example shows how to convert a comma delimited CSV file into a "^" delimited TXT file and print the contents.

```
10 DECLARE STRING CSVDB$(1,2)
20 LET NUMOFCOLS = CSVLOAD(CSVDB$, "E:RECORDS.CSV")
30 LET CSVEROR = CSVSTORE(CSVDB$, "E:NEWREC.TXT", "^")
40 LET NUMOFCOLS = CSVLOAD(CSVDB$, "E:NEWREC.TXT", "^")
50 LET NUMOFROWS = ROWSIZE(CSVDB$)
100 FOR I = 1 TO NUMOFROWS STEP 1
110     FOR J = 1 TO NUMOFCOLS STEP 1
120         PRINT CSVDB$(I, J), " ";
200     NEXT J
210     PRINT ""
300 NEXT I
```

**Comments** The elements of the array should follow the rules in IETF RFC 4180:  
<http://tools.ietf.org/html/rfc4180>

There is no limit on the number of columns per row when storing to a CSV file. However, a file stored with rows that exceed the column limit imposed by **CSVLOAD** will not be loaded by the **CSVLOAD** function.

There is no limit on the size of a row when stored to a CSV file. However, a file stored with rows that exceed the size limit imposed by **CSVLOAD** will not be loaded by the **CSVLOAD** function.

## TXTLOAD

This function will read the contents of an ASCII text file into a ZBI string variable.

**Format** `TXTLOAD(DEST$, FILENAME$)`

### Parameters

**DEST\$** = string to store the contents of **FILENAME\$**.

**FILENAME\$** = name of the file to read. Drive location and file name must be in quotation marks. The file extension must be either ".CSV" or ".TXT".

**Returns** The number of bytes read from the file. The function will return 0 if the file could not be read.

**Example:** This example shows how to print out the contents of a file.

```
10 LET TXTSIZE = TXTLOAD(TXTDATA$, "E:MYDATA.TXT")
20 PRINT STR$(TXTSIZE), "bytes:", TXTDATA$
```

**Comments** The data originally in **DEST\$** will be overwritten upon completion of this function.

# TXTSTORE

This function will store the contents of a ZBI string in an ASCII text file.

**Format** `TXTSTORE(SRC$, FILENAME$)`

## Parameters

`SRC$` = string to store to `FILENAME$`.

`FILENAME$` = name of the file to store. Drive location and file name must be in quotation marks. The file extension must be either ".CSV" or ".TXT".

**Returns** Returns a 0 if there were no errors, otherwise a 1 is returned.

**Example:** This example shows how to append a text file.

```
10 LET TXTSIZE = TXTLOAD(TXTDATA$, "E:MYDATA.TXT")
11 REM Append a date/time stamp to the file
20 LET TXTDATA$ = TXTDATA$ & " " & DATE$ & " " & TIME$
30 LET TXTSIZE = TXTSTORE(TXTDATA$, "E:MYDATA.TXT")
40 PRINT TXTDATA$
```

## Events

This section explains how to capture and trigger internal events in the printer. Here's a quick list of these commands:

**Available Events** A table that correlates a ZBI event with an identification number.

**ZBI Key Names** Details the names of each printer's front panel buttons, ZBI names, and ZBI event ID.

**REGISTEREVENT** Sets up the **HANDLEEVENT** function to receive notification when the specified event has occurred.

**UNREGISTEREVENT** Allows events that are currently set to be captured by the program to no longer be captured.

**HANDLEEVENT** Once events have been registered, this function is used to see what events have occurred.

**TRIGGEREVENT** Allows for front panel buttons to be triggered programmatically.

There are certain events in the printer that a ZBI 2.0 program can receive. To do this, the program first registers for the event. On a regular basis, call a function to handle events. When an event occurs that the program is registered for, the function will return the event's identification number.

## Available Events

Table 26 •

| ZBI Event ID | ZBI Event        |
|--------------|------------------|
| 1            | menu key         |
| 2            | pause key        |
| 3            | feed key         |
| 4            | cancel key       |
| 5            | up arrow key     |
| 6            | plus key         |
| 7            | minus key        |
| 8            | enter key        |
| 9            | setup exit key   |
| 10           | select key       |
| 11           | cancel all event |
| 12           | config label     |
| 13           | timer1           |
| 14           | timer2           |
| 15           | timer3           |
| 16           | timer4           |

Table 26 •

| ZBI Event ID | ZBI Event                     |
|--------------|-------------------------------|
| 17           | <b>timer5</b>                 |
| 18           | <b>spare unused</b>           |
| 19           | <b>previous key</b>           |
| 20           | <b>next save key</b>          |
| 21           | <b>calibrate key</b>          |
| 22           | <b>paper out set</b>          |
| 23           | <b>paper out clear</b>        |
| 24           | <b>ribbon out set</b>         |
| 25           | <b>ribbon out clear</b>       |
| 26           | <b>head too hot set</b>       |
| 27           | <b>head too hot clear</b>     |
| 28           | <b>head cold set</b>          |
| 29           | <b>head cold clear</b>        |
| 30           | <b>head open set</b>          |
| 31           | <b>head open clear</b>        |
| 32           | <b>supply too hot set</b>     |
| 33           | <b>supply too hot clear</b>   |
| 34           | <b>ribbon in set</b>          |
| 35           | <b>ribbon in clear</b>        |
| 36           | <b>rewind full set</b>        |
| 37           | <b>rewind full clear</b>      |
| 38           | <b>cutter jammed set</b>      |
| 39           | <b>cutter jammed clear</b>    |
| 40           | <b>paused set</b>             |
| 41           | <b>paused clear</b>           |
| 42           | <b>pq completed set</b>       |
| 43           | <b>pq completed clear</b>     |
| 44           | <b>label ready set</b>        |
| 45           | <b>label ready clear</b>      |
| 46           | <b>head element bad set</b>   |
| 47           | <b>head element bad clear</b> |
| 48           | <b>basic runtime set</b>      |
| 49           | <b>basic runtime clear</b>    |
| 50           | <b>basic forced set</b>       |
| 51           | <b>basic forced clear</b>     |
| 52           | <b>power on set</b>           |
| 53           | <b>power on clear</b>         |
| 54           | <b>clean printhead set</b>    |
| 55           | <b>clean printhead clear</b>  |

| 65           | <b>rfid error clear</b>   |
| 66           | <b>any messages set</b>   |
| 67           | <b>any messages clear</b> |
| 68           | auto baud                 |
| 69           | factory default           |
| 70           | networking default        |
| 71           | networking factory        |
| 72           | print width               |
| 73           | darkness adjust           |
| 74           | calibrate                 |
| 75           | scroll key                |
| 76           | soft key 1                |
| 77           | soft key 2                |

## ZBI Key Names

This section details the names to use for each printer's front panel buttons when creating ZBI 2.0 programs to capture the buttons.

### ZT200/ZT400/ZD500/QIn

Table 27 •

| ZT2X0             | ZT400      | ZD500  | QIn | ZBI Event ID | ZBI Name      |  |  |
|-------------------|------------|--------|-----|--------------|---------------|--|--|
| Left Soft button  |            |        |     | 76           | soft key 1    |  |  |
| Right Soft Button |            |        |     | 77           | soft key 2    |  |  |
| Plus              | Up Arrow   |        |     | 6            | plus key      |  |  |
| Minus             | Down Arrow |        |     | 7            | minus key     |  |  |
| Left Arrow        |            |        |     | 19           | previous key  |  |  |
| Right Arrow       |            |        |     | 20           | next save key |  |  |
| Setup             | OK         | Check  | OK  | 10           | select key    |  |  |
| Pause             |            | no key |     | 2            | pause key     |  |  |
| Feed              |            |        |     | 3            | feed key      |  |  |
| Cancel            |            | no key |     | 4            | cancel key    |  |  |

### Xi4/RXi4/XIIIPlus/PAX4/105SL/ZE500

Table 28 •

| XIIIPlus/PAX4/Xi4/RXi4/<br>ZE500/105SL Plus<br>Front Panel Key | 105SL<br>Front Panel Key | ZBI Event ID | ZBI Name       |
|----------------------------------------------------------------|--------------------------|--------------|----------------|
| Right Oval                                                     | Plus (+)                 | 6            | plus key       |
| Left Oval                                                      | Minus (-)                | 7            | minus key      |
| Previous                                                       |                          | 19           | previous key   |
| Next/Save                                                      |                          | 20           | next save key  |
| Setup/Exit                                                     |                          | 9            | setup exit key |
| Pause                                                          |                          | 2            | pause key      |
| Feed                                                           |                          | 3            | feed key       |
| Cancel                                                         |                          | 4            | cancel key     |
| Calibrate                                                      |                          | 21           | calibrate key  |

## REGISTEREVENT

**Description** This function will set up the **HANDLEEVENT** function to receive notification when the specified event has occurred. Events can be registered for one time or until the program is exited.

**Important** • If an event occurs twice or more before the **HANDLEEVENT** function is called, only one event will be received.

### Format

```
REGISTEREVENT(X)  
REGISTEREVENT(X,Y)  
REGISTEREVENT(X,Y,Z)
```

### Parameters

**(X)** = This is the ID of the event being registered for.

**(Y)** = If Y=1: the event happens once; If Y=0: the event stays registered for the duration of the program, or until it is unregistered.

**(Z)** = For System Events: if Z=0, the event will still be handled by the printer. If Z=1, then only ZBI will receive the event.

For Timer Events: this is the timer interval in mSec. If the interval is less than 0 or greater than 1,000,000,000, it is set to 1000.

**Returns** The ID of the successfully registered event. If an event was not successfully registered, a -1 is returned.

**Example:** Here is an example of how to use the REGISTEREVENT command:

```
1 REM This example shows how to override the functionality of the
feed
1 REM key
1 REM using the event system. After all why waste a label when you
1 REM could put
1 REM valuable information there
AUTONUM 1,1

PRINT #ZPLPORT: GETVAR$("odometer.total_print_length") & "^FS"
PRINT #ZPLPORT: "^XZ"
```

**Comments** None

## UNREGISTEREVENT

**Description** This function allows events that are currently set to be captured by the program to no longer be captured. Once called events will return to the normal method of processing if the REGISTEREVENT function Z parameter was set to 1.

**Format** UNREGISTEREVENT(X)

**Parameters** (X) = the ID of the event to stop

**Returns** 0 if the event is a valid event to unregister. A -1 if the event does not exist.

→ **Example:** Here is an example of how to use the UNREGISTEREVENT command:

```
AUTONUM 1,1
LET OUTSTR$ = "Processing"
LET LOOPCTR = 200
LET TIMER5 = 17
LET TMP = REGISTEREVENT(TIMER5, 0, 1000)
DO WHILE LOOPCTR > 0
LET EVT = HANDLEEVENT()
IF EVT = TIMER5 THEN
LET A = SETVAR("device.frontpanel.line2",OUTSTR$)
LET OUTSTR$ = OUTSTR$ & "."
IF LEN(OUTSTR$) >16 THEN
LET OUTSTR$ = "Processing"
END IF
END IF
LET LOOPCTR = LOOPCTR - 1
SLEEP 1
LOOP
LET TMP = UNREGISTEREVENT(TIMER5)
LET A = SETVAR("device.frontpanel.line2","",")
END
```

**Comments** None

## HANDLEEVENT

**Description** Once events have been registered, this function is used to see what events have occurred.

**Format** HANDLEEVENT()

**Parameters** N/A

**Returns** The ID of the event that occurred. One event at a time will be returned through this function. The order of the events are based on priority. The priority is based on the ID number of the event, with the exception of the timer events, which have the highest priority.

**Example:** Here are examples of how to use the **HANDLEEVENT** command:

```
1 REM This example shows how to override the feed key functionality
1 REM using the event system. Why waste a label when you could put
1 REM valuable information there
AUTONUM 1,1
CLOSE ALL
LET ZPLPORT = 1
OPEN #ZPLPORT: NAME "ZPL"
LET FEEDKEY = 3
LET TMP = REGISTEREVENT(FEEDKEY, 0, 1)

PRINT #ZPLPORT: "^FDODometer: ";
PRINT #ZPLPORT: GETVAR$("odometer.total_print_length") & "^FS"
PRINT #ZPLPORT: "^XZ"
```

**Comments** None

# TRIGGEREVENT

This function allows for front panel buttons to be triggered programmatically.

**Format** TRIGGEREVENT(X)

## Parameters

X = the ID of the event from the possible event list to TRIGGER.

See the following printer tables for events that can be triggered by this command:

- *Xi4/RXi4/XiIIIPlus/PAX4/105SL/ZE500 on page 539*
- *105SL Front Panel Key on page 539*
- *ZM400/ZM600/RZ400/RZ600/Z4Mplus/Z6Mplus on page 540*
- *S4M on page 540*

**Returns** Always returns 0.

**Example:** Here are examples of how to use the TRIGGEREVENT command:

```
1 REM THIS IS AN EXAMPLE OF HOW TO TRIGGER AN EVENT
AUTONUM 1,1
LET PAUSEKEY = 2
DO WHILE 1 = 1
LET A = TRIGGEREVENT(PAUSEKEY)
LET A = SETVAR("device.frontpanel.line2",str$(A))
SLEEP 2
LOOP
```

**Comments** None

## Systems

This section contain miscellaneous systems interface functions. Here's a quick list of these commands:

**ISERROR** Returns a non-zero value if there is an internal error set in the printer.

**IWARNING** Returns a non-zero value if there is an internal warning set in the printer.

**SLEEP** Specifies the time that the interpreter pauses.

**SETERR** Sends a message to the printer to set the error flag.

**CLRERR** Sends a message to the printer to clear the error flag.

**ON ERROR** Prevents a program from halting in the event of an error.

## ISERROR

This function returns a non-zero value if there is an internal error set in the printer. Otherwise, the numeral returned will 0.

**Format ISERROR**

**Parameters** N/A

**Returns** 0 for no errors; 1 if there is an error.

**Example:** Here is an example of the ISERROR command.

```
10 PRINT ISERROR
RUN
0
```

**Comments** None

## ISWARNING

This function returns a non-zero value if there is an internal warning set in the printer. Otherwise, the numeral returned will 0.

**Format** ISWARNING

**Parameters** N/A

**Returns** 0 for no errors; 1 if there is an error.

**Example:** Here is an example of the ISWARNING command.

```
10 PRINT ISWARNING
RUN
0
```

**Comments** None

## SLEEP

This command specifies the time that the interpreter pauses. This command could be sent to the printer after sending a label format to be printed. The interpreter pauses in its processing for the amount of time specified.

**Format** **SLEEP <A>**

**Parameters** **<A>** = the time in seconds (0 to 500) the interpreter pauses.

**Example:** This is an example of how to use the **SLEEP** command:

**10 SLEEP 450**

**Comments** If a timer is needed, use the **Event** system. The timer will allow for processing other items, where **SLEEP** will stop execution of any ZBI commands for the specified **SLEEP** period.

This is a program command and must be preceded by a line number.

Calling **SLEEP** with **<A>** set to zero will force the ZBI task to yield to the rest of the system and allow any pending tasks to run (e.g., pending ZPL commands). If there are no pending tasks, ZBI will sleep for a minimum of 8 milliseconds.

## SETERR

This command sends a message to the printer to set the error flag. A logical interpreter flag is triggered in the printer. This error is referenced as a BASIC Forced Error.

### Format SETERR

### Parameters N/A

**Example:** An example of the **SETERR** and **CLRERR** commands.

```
AUTONUM 1,1
OPEN #1:NAME "ZPL"
PRINT #1: "^XA^SX0,A,Y,Y^XZ"
CLOSE #1
FOR I=1 TO 10
SLEEP 5
IF MOD(I,2)=1 THEN
SETERR
ELSE
CLRERR
ENDIF
NEXT I
```

**Comments** This is a program command and must be preceded by a line number.

## CLRERR

This command sends a message to the printer to clear the error flag. A logical interpreter flag is cleared in the printer. This error is referenced as a BASIC Forced Error.

**Format 10 CLRERR**

**Parameters** N/A

**Example:** See *SETERR* [on page 552](#).

**Comments** This is a program command that is preceded by a line number.

## ON ERROR

The **ON ERROR** command can be used to prevent a program from halting in the event of an error. If an error occurs in a previous line during program execution, the **ON ERROR** statement calls the **GOTO** or **GOSUB** statement and allows the program to continue.

### Format

```
ON ERROR GOTO <A>
ON ERROR GOSUB <A>
```

**Parameters** **<A>** = the destination location in the program should an error be triggered on the previous line.

**Example:** This is an example of how to use the **ON ERROR** command:

```
30 LET A = B/C
40 ON ERROR GOTO 100
...
100 PRINT "DIVIDE BY ZERO OCCURRED"
110 LET A = 0
120 GOTO 50
...
```

**Example:** See *TCP Server on page 520* or *UDP Server on page 522*.

### Comments

If there is no error, this line is ignored.

This is a program command that is preceded by a line number.

## Applicator Functions

The printer applicator port option can be controlled in part or completely by ZBI 2. When ZBI takes control of a pin, the printer's built-in applicator functionality will not have access to that pin. This function will allow the printer to perform some of the functionality that a programmable logic controller (PLC) could.

**AUXPORT\_STEALPIN** Takes control of a pin and allows ZBI to perform other actions on the pin.

**AUXPORT\_SETPIN** Sets the output level on an applicator pin.

**AUXPORT\_GETPIN** Retrieves the state of the applicator pin.

**AUXPORT\_RELEASEPIN** Returns a pin controlled by ZBI to normal printer operation.

## AUXPORT\_STEALPIN

This function will take control of a pin and allow ZBI to perform other actions on the pin.

**Format** AUXPORT\_STEALPIN(X)

**Parameters** X = perform action on this applicator port pin.

**Returns** This function returns -1 upon failure and 0 upon success.

**Example:** This is an example of the AUXPORT\_STEALPIN command:

```
1 REM Demo applicator to show control of applicator pins
1 REM on the printer
1 REM The application is to create a light pole with an
1 REM external feed button
AUTONUM 1,1
LET RED = 9
LET YELLOW = 10
LET GREEN = 11
LET BUTTON = 4
LET FEED_KEY = 3
LET TMP = AUXPORT_STEALPIN(RED)
LET TMP = AUXPORT_STEALPIN(YELLOW)
LET TMP = AUXPORT_STEALPIN(GREEN)
LET TMP = AUXPORT_STEALPIN(BUTTON)
DO WHILE 1 = 1
SLEEP 1
IF ISERROR = 1 THEN
LET TMP = AUXPORT_SETPIN(RED,1)
LET TMP = AUXPORT_SETPIN(YELLOW,0)
LET TMP = AUXPORT_SETPIN(GREEN,0)
ELSE IF ISWARNING = 1 THEN
LET TMP = AUXPORT_SETPIN(RED,0)
LET TMP = AUXPORT_SETPIN(YELLOW,1)
LET TMP = AUXPORT_SETPIN(GREEN,0)
ELSE
LET TMP = AUXPORT_SETPIN(RED,0)
LET TMP = AUXPORT_SETPIN(YELLOW,0)
LET TMP = AUXPORT_SETPIN(GREEN,1)
END IF
IF AUXPORT_GETPIN(BUTTON) = 1 THEN
LET A = TRIGGEREVENT(FEED_KEY)
END IF
LOOP
```

**Comments** If this pin is not controlled via ZBI (power pin), this function will return -1.

## AUXPORT\_SETPIN

This function sets the output level on an applicator pin.

**Format** AUXPORT\_SETPIN(X,Y)

**Parameters**

X = perform action on this applicator port pin.

Y = The value to set on the pin (1 = high, 0 = low).

**Returns** This function returns -1 upon failure and 0 upon success.

**Example:** See *AUXPORT\_STEALPIN on page 555*.

**Comments** If this pin is not controlled via ZBI (power pin), this function will return -1. See *AUXPORT\_STEALPIN on page 555*.

## AUXPORT\_GETPIN

**Description** This function will retrieve the state of the applicator pin.

**Format** AUXPORT\_GETPIN(X)

**Parameters** X = perform action on this applicator port pin.

**Returns** This function returns 1 if pin is in high state, 0 in low state, and -1 upon failure.

→ **Example:** See *AUXPORT\_STEALPIN on page 555*.

**Comments** If this pin is not controlled via ZBI (power pin), this function will return -1. See *AUXPORT\_STEALPIN on page 555*.

## AUXPORT\_RELEASEPIN

**Description** This function returns a pin controlled by ZBI to normal printer operation.

**Format** AUXPORT\_RELEASEPIN(X)

**Parameters** X = perform action on this applicator port pin.

**Returns** This function returns -1 upon failure and 0 upon success.

**Example:** This is an example of the AUXPORT\_RELEASEPIN command:

```
90 LET TMP = AUXPORT_RELEASEPIN(X)
```

**Comments** If this pin is not controlled via ZBI (power pin), this function will return -1. See [AUXPORT\\_STEALPIN on page 555](#).

## String Functions

This section identifies how to handle string manipulation. Here is a quick list of these commands:

**LCASE\$** Converts a string to all lowercase characters.

**CHR\$** Takes a value between 0 and 255 and puts that value into a string.

**LTRIM\$** Removes leading spaces from a string.

**REPEAT\$** Creates multiple copies of a string combined into a new string.

**RTRIM\$** Returns a string with trailing spaces removed

**SPLIT** Splits a string into sub-strings

**SPLITCOUNT** Returns the number of sub-strings that would be returned by the SPLIT function.

**UCASE\$** Converts a string to all uppercase characters

**EXTRACT\$** Searches for a string based on a starting and ending string.

**ORD** Returns the ASCII value of the first character of string A\$.

**POS** Returns the location of the first occurrence of a search string in the target string.

**LEN** Returns the length of a string.

## LCASE\$

This function will convert a string to all lowercase characters.

**Format** `LCASE$ (A$)`

**Parameters** (`A$`) = the string that will be converted

**Returns** The characters in `A$` converted to lowercase.

**Example:** This is an example of how to use the `LCASE$` command.

```
10 LET B$=LCASE$ ("Hello World")
20 PRINT B$
RUN
hello world
```

**Comments** This will only work on non-accented Latin characters, A-Z.

## CHR\$

This function takes a value between 0 and 255 and puts that value into a string.

**Format** `CHR$(VAL)`

**Parameters** `(VAL)`= The numeric value of the string character.

**Returns** A single character string containing the value entered.

**Example:** This is an example of how to use the `CHR$` command to easily put control characters into strings:

```
10 LET NULL$=CHR$(0)
20 LET STX$=CHR$(2)
30 LET ETX$=CHR$(3)
40 LET EOT$=CHR$(4)
```

**Comments** None

## LTRIM\$

This function removes leading spaces from a string.

**Format** LTRIM\$(A\$)

**Parameters** (A\$) = the string to convert.

**Returns** The string in A\$ with no spaces.

**Example:** This is an example of how to use the LTRIM\$ (A\$) command:

```
10 LET A$=" Hello"  
20 PRINT LTRIM$(A$)  
RUN  
Hello
```

**Comments** None

# REPEAT\$

This function creates multiple copies of a string combined into a new string.

**Format** REPEAT\$(A\$,M)

**Parameters**

A\$ = the base string to duplicate

M = the number of times to duplicate A\$

**Returns** A string containing M copies of A\$. **Note:** When M=0, an empty string is returned.

**Example:** This is an example of how to use the REPEAT\$ (A\$, M) command:

```
10 PRINT REPEAT$("Hello",3)
```

RUN

*HelloHelloHello*

**Comments** None

## RTRIM\$

This function returns a string with trailing spaces removed.

**Format** RTRIM\$(A\$)

**Parameters** (A\$) = the base string

**Returns** A\$ with trailing spaces removed.

**Example:** This is an example of how to use the RTRIM\$ (A\$) command:

```
10 LET A$="Hello "
20 LET B$="World"
30 PRINT A$ & B$
40 PRINT RTRIM$(A$)& B$
RUN
Hello World
HelloWorld
```

**Comments** None

# SPLIT

**Description** This function allows a string to be split into sub-strings

## Format

```
SPLIT(DEST$, SOURCE$, DELIMITER$)  
SPLIT(DEST$, SOURCE$, DELIMITER$, MAXCOUNT)
```

## Parameters

**DEST\$** = the array to populate with the sub-strings created by the split

**SOURCE\$** = the string that will be searched for the provided delimiter

**DELIMITER\$** = the delimiter string (may be more than one character) to search for

**MAXCOUNT** = the maximum number of sub-strings the string should be split into. A

negative value will return every sub-string created by the split. A value of zero will return empty strings in the array. If not specified, the limit will be the maximum size of the array.

**Returns** The number of sub-strings placed into the DEST\$ array. If the number of sub-strings is less than the size of DEST\$, the remaining elements of the array will be set to empty strings.

**Example 1:** This is an example of how to use the SPLIT command:

```
1 REM Example - This example show how the SPLIT and SPLITCOUNT
1 REM commands can be
1 REM used to merge a comma separated variable string(CSV)
1 REM into a stored format
AUTONUM 1,1

DECLARE STRING SPLITSTRING$(CNT)
ON ERROR GOTO RECOVERY
LET CNT = SPLIT(SPLITSTRING$,DATA$, ",")  

PRINT #ZPLPORT: "^XA^XF";SPLITSTRING$(1);"^FS"  

IF CNT >= 2 THEN
FOR I = 2 TO CNT
PRINT #ZPLPORT: "^FN";I-1;"^FD";SPLITSTRING$(I);"^FS"  

NEXT I
END IF
PRINT #ZPLPORT: "^XZ"
SUB RECOVERY
RETURN

```

**Comments** If the delimiter is an empty string, or does not appear in the **SOURCE\$** string, the first entry of the array will be the source string and all other elements will be empty strings.

When the **SPLIT** function encounters a delimiter at the beginning or end of the source string, or two delimiters in a row, it populates the corresponding array element with an empty string.

If **MAXCOUNT** is larger than the number of returned sub-strings (N), the last **MAXCOUNT** - N array elements will be empty strings. If **MAXCOUNT** is larger than the destination array or is negative, the size of the array will be used as the **MAXCOUNT**. Therefore, the smallest value among the value of **MAXCOUNT**, the size of the return array, or the number of sub-strings found determines the maximum number of sub-strings that will be returned.

If **MAXCOUNT** is less than the number of delimiters in a string the last string in the array will hold the end of the string starting from where the last delimiter was found. For example, if **SOURCE\$** = "one,two,three,four,five", **DELIMITER\$** = ",", and **MAXCOUNT** = 2, the output would be two strings: "one" and "two,three,four,five".

If a two dimensional array is provided for **DEST\$**, the array will be filled linearly. For example, an array that is 2 x 3 (for example, **DECLARE STRING MYARRAY\$(2,3)**) will be filled from (0,0), then (0,1) up to (2,3).

# SPLITCOUNT

**Description** This function returns the number of sub-strings that would be returned by the SPLIT function.

**Format** `SPLITCOUNT(SOURCE$, DELIMITER$)`

## Parameters

**SOURCE\$** = the string that will be searched for the provided delimiter.

**DELIMITER\$** =5

**Returns** The number of sub-strings that would be returned by the **SPLITCOUNT** function.

**Example:** This function shows how to determine the number of sub-strings that the **SPLITCOUNT** command would produce

```
10 LET CNT = SPLITCOUNT("ONE,,,FOUR,FIVE,,SEVEN,", ",")  
20 PRINT "Number of sub-strings returned is", STR$(CNT)  
RUN  
Number of sub-strings returned is 8
```

**Comments** None

## UCASE\$

This function converts a string to all uppercase characters.

**Format** UCASE\$(A\$)

**Parameters** A\$ = the base string to convert

**Returns** A\$ converted to uppercase.

**Example:** This is an example of how to use the UCASE\$ (A\$) command:

```
10 LET A$="Zebra Technologies"  
20 PRINT UCASE$(A$)  
RUN  
ZEBRA TECHNOLOGIES
```

**Example:** This is an example of how to capitalize a line.

```
10 LET A$="The Cow jUmped Over THE Moon."  
20 LET A$=LCASE$(A$)  
30 LET A$(1:1)=UCASE$(A$(1:1))  
40 PRINT A$  
RUN  
The cow jumped over the moon.
```

**Comments** This will only convert non-accented Latin characters, a-z.

# EXTRACT\$

This function searches for a string based on a starting and ending string. When these two strings are found, the string between them is returned.

**Important** • If the EXTRACT\$ command encounters a carriage return line feed before encountering the beginning character or the ending character, it returns null.

## Format

```
EXTRACT$ (CHANNEL, START$, STOP$)  
EXTRACT$ (A$, START$, STOP$)
```

## Parameters

**CHANNEL** = extracts data from this channel

**A\$** = the source string

**START\$** = Once this string is found, the extract pulls characters immediately following.

**STOP\$** = the extraction stops when this string is found

**Example:** This example shows how to extract the word Technologies from this string:  
Zebra, Technologies, Corporation.

This is what the program looks like to accomplish this:

```
10 LET A$ = "Zebra, Technologies, Corporation,"  
20 LET DATA$ = EXTRACT$(A$, ", ", ",")
```

**Example:** This example shows how the EXTRACT\$ command works from an open port:

```
10 OPEN #1: NAME "SER"  
20 LET DATA$ = EXTRACT$(1, ", ", ",")
```

Notice how the quotes are used to show a literal character, in this case a comma.

**Example:** This example shows how the start and stop points are variable; a variable name is used instead of the literal:

```
10 LET B$ = ","  
20 LET A$ = "Zebra, Technologies, Corporation"  
30 LET DATA$ = EXTRACT$(A$, B$, B$)  
40 PRINT DATA$  
RUN  
Technologies
```

**Example:** This example shows how an empty string can be used to extract from the start of the input string to the end string:

```
10 LET IN$ = "BLAH BLAH <END>"  
20 LET B$ = EXTRACT$(IN$, "", "<END>")  
30 PRINT B$  
RUN  
BLAH BLAH
```

**Example:** This example will use an empty string to extract to the end of a line:

```
10 LET IN$ = "BLAH <START> THE DATA"  
20 LET B$ = EXTRACT$(IN$, "<START>", "")  
30 PRINT B$  
RUN  
THE DATA
```

**Comments** EXTRACT\$ reads in and discards data until the start criteria is met. Then, all data is returned up to the stop criteria.

## ORD

This function returns the ASCII value of the first character of string A\$.

**Format** ORD(A\$)

**Parameters** A\$ = Input string: only the first character will be used.

**Returns** The ASCII value of the first character.

**Example:** This is an example of how to use the ORD (A\$) command:

```
10 LET A$="ABC"  
20 PRINT ORD(A$)  
RUN  
65
```

**Comments** None

## POS

This function returns the location of the first occurrence of a search string in the target string.  
It can be assigned an index.

### Format

**POS(A\$,B\$)**  
**POS(A\$,B\$,M)**

### Parameters

**A\$** = the target string to search  
**B\$** = the search string to find in **A\$**  
**M** = The index to start looking for **B\$**. If omitted, the search will start at the beginning of the string. **M** must be greater than zero.

**Returns** The location of the string. If the string is not found, this will return 0.

**Example:** This is an example of how to use the **POS** command:

```
10 LET A$="Hello World"  
20 LET B$="o"  
30 PRINT POS(A$,B$)  
40 PRINT POS(A$,B$,1)  
50 PRINT POS(A$,B$,6)  
RUN  
5  
5  
8
```

**Comments** None

## LEN

This function returns the length of a string.

**Format** `LEN(A$)`

**Parameters** `A$` = the target string from which to determine the length.

**Returns** The length of the string.

**Example:** This example identifies the length of a string. Hello World is 11 characters, as follows:

```
10 LET A$="Hello World"  
20 PRINT LEN(A$)  
RUN  
11
```

**Comments** None

## Math Functions

This section identifies how to handle mathematical calculations. Here is a quick list of these commands:

**STR\$** Converts a number to a string.

**MAX** Returns the greater value between two numbers.

**MIN** Returns the smaller value of two numbers.

**MAXNUM** returns the largest number permitted by this machine.

**MOD** Computes the remainder from division.

**VAL** Evaluates the number represented by a string.

**INTTOHEX\$** Takes a numeric value and converts it into a hexadecimal string.

**HEXToint** Converts hexadecimal strings to integers.

## STR\$

This function converts a number to a string.

**Format** STR\$(X)

**Parameters** X = the number to convert to a string

**Returns** A string representing X.

**Example:** This is an example of how to use the STR\$ (X) command:

```
10 LET A=53
20 PRINT STR$(A)
RUN
53
```

**Comments** None

## MAX

This function returns the greater value between two numbers.

**Format** MAX(X,Y)

**Parameters**

X = the first number to compare  
Y = the second number to compare

**Returns** The greater of X or Y.

**Example:** This is an example of how to use the MAX (X, Y) command:

```
10 LET A=-2
20 LET B=1
30 PRINT MAX(A,B)
RUN
1
```

**Comments** None

## MIN

This function returns the smaller value of two numbers.

**Format** MIN(X,Y)

**Parameters**

X = the first number to compare  
Y = the second number to compare

**Returns** The smaller of X or Y.

**Example:** This is an example of how to use the MIN (X, Y) command:

```
10 LET A=-2
20 LET B=0
30 PRINT MIN(A,B)
RUN
-2
```

**Comments** None

## MAXNUM

This function returns the largest number permitted by this machine: 2,147,483,647.

**Format** MAXNUM

**Parameters** N/A

**Returns** The largest number that the NUMERIC type can handle (2,147,483,647).

**Example:** This is an example of how to use the MAXNUM command:

```
10 PRINT MAXNUM
RUN
2147483647
```

**Comments** None

## MOD

This function computes the remainder from division. (This is known as the modulus.)

**Format** MOD(X,Y)

**Parameters**

X = the value to be modulated (numerator).  
Y = the base number or divisor (denominator).

**Returns** The remainder of the division (X/Y).

**Example:** This is an example of how to use the MOD (X, Y) command:

```
10 PRINT MOD(25,10)
20 PRINT MOD(2,1)
30 PRINT MOD(3,2)
40 PRINT MOD(9,2)
50 PRINT MOD(-2,9)
60 PRINT MOD(2,0)
RUN
5
0
1
1
-2
ERROR OCCURRED ON LINE 60:DIVIDE BY ZERO
```

**Comments** None

## VAL

This function evaluates the number represented by a string.

**Format** `VAL(A$)`

**Parameters** `A$` = This is the input string to pull the number from. Non-numbers are ignored.

**Returns** The numeric representation of the string.

**Example:** This is an example of how to use the `VAL(A$)` command:

```
10 LET A$="123"  
20 LET C=VAL(A$)  
30 PRINT C  
RUN  
123  
  
PRINT VAL("321A123")  
321123
```

**Comments** None

## INTTOHEX\$

**Description** This function will take a numeric value and convert it into a hexadecimal string. The range of values for integers is:

-2,147,483,648 to +2,147,483,647

**Format** INTTOHEX\$(A)

**Parameters** A = The numeric value to convert.

**Returns** A string representing the integer in hex.

→ **Example:** These print statements show the output of the INTTOHEX\$ function given different values.

```
PRINT INTTOHEX$(1)
1

PRINT INTTOHEX$(10)
A

PRINT INTTOHEX$(16)
10

PRINT INTTOHEX$(20)
14

PRINT INTTOHEX$(30)
1E

PRINT INTTOHEX$(100)
64

PRINT INTTOHEX$(123124)
1EOF4

PRINT INTTOHEX$(-5)
0

PRINT INTTOHEX$(-99)
0
```

**Comments** Negative values will be returned as 0.

## HEXTOINT

This function will convert hexadecimal strings to integers.

**Format** HEXTOINT(A\$)

**Parameters** A\$ = The hex string to convert.

**Returns** A integer string computed from the hexadecimal string.

→ **Example:** These print statements show the output of the INTTOHEX function given different values.

```
PRINT HEXTOINT("0")
0

PRINT HEXTOINT("A")
10

PRINT HEXTOINT("a")
10

PRINT HEXTOINT("1A")
26

PRINT HEXTOINT("10")
16

PRINT HEXTOINT("AaAa")
43690

PRINT HEXTOINT("AAAA")
43690

PRINT HEXTOINT("-1")
0

PRINT HEXTOINT("-A")
0
```

**Comments** Negative values will be returned as 0.

## Array Functions

This section describes the functions to search, resize, and query arrays.

**REDIM** Changes the size of an array.

**INSERTROW** Inserts a new row into an existing array.

**DELROW** Deletes a new row from an existing array

**ROWSIZE** Returns the number of rows in an array.

**COLUMNSIZE** Returns the number of columns in an array.

**FIND** Searches a string array for an occurrence of a sub-string.

## REDIM

This command will change the dimensions of an array.

### Format

```
REDIM <ARRAYNAME>(<SIZE>)
REDIM <ARRAYNAME>(<ROWS>,<COLUMNS>)
REDIM <ARRAYNAME$>(<SIZE>)
REDIM <ARRAYNAME$>(<ROWS>,<COLUMNS>)
```

### Parameters

<SIZE> = new number of entries in a single dimension array.  
<ROWS> = new number of rows in a two dimensional array.  
<COLUMNS> = new number of columns in a two dimensional array.

**Example:** This example shows how to change a one dimensional numeric array.

```
10 DECLARE NUMERIC SCORES(3)
20 LET SCORES(1) = 85
30 LET SCORES(2) = 92
40 LET SCORES(3) = 98
50 REDIM SCORES(2) ! Discard the last one
```

**Example:** This example shows how to change a two dimensional string array.

```
10 DECLARE STRING NAMEAGES$(3,2)
20 LET NAMEAGES$(1,1) = "Abraham"
30 LET NAMEAGES$(1,2) = "Lincoln"
40 LET NAMEAGES$(2,1) = "Dwight"
50 LET NAMEAGES$(2,2) = "Eisenhower"
60 LET NAMEAGES$(3,1) = "Theodore"
70 LET NAMEAGES$(3,2) = "Roosevelt"
80 REDIM NAMEAGES$(5,2) ! Make room for more
```

**Comments** The **REDIM** must have the same number of dimensions as the original declaration of the array.

- If the array has two dimensions, the second array bound cannot change. It must have the same value as the original declaration.
- If **REDIM** makes an array smaller, elements (or rows, for a two dimensional array) at the end of the array are discarded.
- If **REDIM** makes an array larger, elements (or rows) are added at the end of the array, and initialized as they would be with a **DECLARE**.

This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## INSERTROW

This command will insert a new row into an existing array.

**Format** `INSERTROW (<ARRAYNAME>, <INDEX>)`

### Parameters

`<ARRAYNAME>` = array where the row will be inserted

`<INDEX>` = index of the row in the array that the new row will be inserted before

→ **Example:** This example shows how to insert a row into the middle of an array.

```
10 DECLARE NUMERIC SCORES(3)
20 LET SCORES(1) = 85
30 LET SCORES(2) = 92
40 LET SCORES(3) = 98
50 INSERTROW(SCORES, 2)
60 LET SCORES(2) = 100
```

→ **Example:** This example shows how to add a row into the end of an array.

```
10 DECLARE NUMERIC SCORES(3)
20 LET SCORES(1) = 85
30 LET SCORES(2) = 92
40 LET SCORES(3) = 98
50 INSERTROW(SCORES, 4)
60 LET SCORES(4) = 100
```

**Comments** Inserting a row increases the size of the array by one row, and moves all the rows from `INDEX` to the end of the array up one row, leaving an empty row at position `INDEX`.

`INDEX` cannot be any larger than the number of rows in the array plus one. If the number of rows plus one is provided, the new row will be added to the end of the array.

This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

# DELROW

This command will delete a row from an existing array.

**Format** **DELROW (<ARRAYNAME>, <INDEX>)**

## Parameters

<**ARRAYNAME**> = the array where the row will be deleted  
<**INDEX**> = index of the row to delete from the array

**Example:** This example shows how to delete a row from the middle of an array.

```
10  DECLARE NUMERIC SCORES(5)
20  LET SCORES(1) = 85
30  LET SCORES(2) = 92
40  LET SCORES(3) = 98
50  LET SCORES(4) = 45
60  LET SCORES(5) = 100
70  DELROW(SCORES, 4) ! Remove the low score
```

**Comments** This decreases the size of A by one row, and moves all the rows from INDEX to the end of the array down by one, overwriting the row at position INDEX.

**INDEX** cannot be any larger the number of rows in the array.

If the array only has one row, that row may not be deleted.

This can be an interactive command that takes effect as soon as it is received by the printer, or a program command that is preceded by a line number.

## ROWSIZE

This function will return the number of rows in an array.

### Format

```
ROWSIZE(A)  
ROWSIZE(A$)
```

### Parameters

A = integer array to query for the number of rows.  
A\$ = string array to query for the number of rows.

**Returns** Returns a 0 if the variable is not an array. Returns the number of elements in the array if the array has only one dimension. Returns the size of the first dimension if the array has two dimensions.

**Example:** This example shows how to determine the number of elements in a one dimensional string array.

```
10 DECLARE STRING NAMES$(3)  
20 LET NAMES$(1) = "Fred"  
30 LET NAMES$(2) = "Wilma"  
40 LET NAMES$(3) = "Barney"  
50 REDIM NAMES$(4) ! Make room for Betty  
60 LET NAMES$(4) = "Betty"  
70 LET NUMOFNAMES = ROWSIZE(NAMES$)  
80 PRINT NUMOFNAMES
```

**Example:** This example shows how to determine the number of rows in a two dimensional numeric array.

```
10 DECLARE NUMERIC SQROFTWOLOOKUP(3,2)  
20 LET SQROFTWOLOOKUP (1,1) = 1  
30 LET SQROFTWOLOOKUP (1,2) = 2  
40 LET SQROFTWOLOOKUP (2,1) = 2  
50 LET SQROFTWOLOOKUP (2,2) = 4  
60 LET SQROFTWOLOOKUP (3,1) = 3  
70 LET SQROFTWOLOOKUP (3,2) = 8  
80 LET NUMOFSQRS = ROWSIZE(SQROFTWOLOOKUP)  
90 PRINT NUMOFSQRS
```

# COLUMNSIZE

This function will return the number of columns in an array.

## Format

```
COLUMNSIZE(A)  
COLUMNSIZE(A$)
```

## Parameters

A = integer array to query for the number of columns.  
A\$ = string array to query for the number of columns.

**Returns** A 0 if the variable is not an array. Returns 1 if the array has only one dimension. Returns the size of the second dimension if the array has two dimensions.

**Example:** This example shows how to determine the number of elements in a one dimensional string array.

```
10 DECLARE STRING NAMES$(3)  
20 LET NAMES$(1) = "Fred"  
30 LET NAMES$(2) = "Wilma"  
40 LET NAMES$(3) = "Barney"  
50 REDIM NAMES$(4) ! Make room for Betty  
60 LET NAMES$(4) = "Betty"  
70 LET NUMOFCOLS = COLUMNSIZE(NAMES$)  
80 PRINT NUMOFCOLS
```

**Example:** This example shows how to determine the number of columns in a two dimensional numeric array.

```
10 DECLARE NUMERIC SQROFTWOLOOKUP(3,2)  
20 LET SQROFTWOLOOKUP (1,1) = 1  
30 LET SQROFTWOLOOKUP (1,2) = 2  
40 LET SQROFTWOLOOKUP (2,1) = 2  
50 LET SQROFTWOLOOKUP (2,2) = 4  
60 LET SQROFTWOLOOKUP (3,1) = 3  
70 LET SQROFTWOLOOKUP (3,2) = 8  
80 LET COLCNT = COLUMNSIZE(SQROFTWOLOOKUP)  
90 PRINT COLCNT
```

## FIND

This function will find an element of a string array that contains an identified search string.

### Format

```
FIND(A$, B$)
FIND(A$, B$, START)
FIND(A$, COLUMN, B$)
FIND(A$, COLUMN, B$, START)
```

### Parameters

A\$ = string array to search for B\$.

B\$ = string to search for within A\$.

START = index within a single dimensional array, or row for a two dimensional array, to start the search.

COLUMN = column to isolate search to in a two dimensional array. This must be supplied if A\$ is a two dimensional array.

**Returns** Returns a 0 if B\$ is not found or if there was an error. Otherwise, returns the index that contains the first occurrence of the string B\$ (the element index for one dimensional arrays, the row for two dimensional arrays).

**Example:** This example shows how to find a string in a one dimensional array.

```
10 DECLARE STRING NAMES$(4)
20 LET NAMES$(1) = "Fred"
30 LET NAMES$(2) = "Wilma"
40 LET NAMES$(3) = "Barney"
50 LET NAMES$(4) = "Betty"
60 LET BARNEYIX = FIND(NAMES$, "Bar")
70 PRINT "Found Barney in element "; STR$(BARNEYIX)
```

→ **Example:** This example shows how to find a string that occurs more than once in a two dimensional array.

```
10  DECLARE STRING CLOTHING$(5,2)
20  LET TYPECOL      = 1
30  LET MATERIALCOL = 2
40  LET CLOTHING$(1,1) = "Gloves"
50  LET CLOTHING$(1,2) = "Knit"
60  LET CLOTHING$(2,1) = "Pants"
70  LET CLOTHING$(2,2) = "Cotton"
80  LET CLOTHING$(3,1) = "Gloves"
90  LET CLOTHING$(3,2) = "Leather"
100 LET CLOTHING$(4,2) = "Shirts"
110 LET CLOTHING$(4,2) = "Polyester"
120 LET CLOTHING$(5,2) = "Pants"
130 LET CLOTHING$(5,2) = "Denim"
140 LET GLOVEIX = 1
150 DO
160 LET GLOVEIX = FIND(CLOTHING$, TYPECOL, "Gloves", GLOVEIX)
170 IF NOT GLOVEIX = 0 THEN
180 PRINT CLOTHING$(GLOVEIX, MATERIALCOL), "gloves are available"
190 LET GLOVEIX = GLOVEIX + 1
200 END IF
210 LOOP WHILE NOT GLOVEIX = 0
```

**Comments** COLUMN must be greater than 0.

If START is given, it must be greater than 0.

FIND will match the first occurrence of B\$, even if it is a substring of a string within the A\$ array. For example, “Coat” will be found in both locations 1 and 4.

```
5 DECLARE STRING A$(5)
10 LET A$(1) = "Over Coat"
20 LET A$(2) = "Hat"
30 LET A$(3) = "Jacket"
40 LET A$(4) = "Coat"
50 LET A$(5) = "Boots"
```

If an exact match is needed, FIND should be called until 0 is returned or the item is found and confirmed. To confirm, check the item against the expected item, it should match exactly. See [CSV Program on page 603](#) for an example showing how to do this.

## Time and Date Functions

This section describes the functions to access the real time clock option. Here is a quick list of these commands:

**DATE\$** Returns the date as a string

**TIME\$** Returns the current time in a string.

**DATE** Gets the current date as a number.

**TIME** Gets the current time as a number.

## DATE\$

This function returns the date as a string.

**Format** DATE\$

**Parameters** N/A

**Returns** The current date in string form YYYYMMDD. If the Real-Time Clock is not installed, an empty string is returned.

**Example:** This is an example of how to use the DATE\$ command:

```
10 PRINT DATE$  
RUN
```

The result, assuming the date is January 1, 2003 is:

```
20030101
```

**Example:** This is another example of the DATE\$ command used with the sub-string operator to get the day of the month:

```
10 LET A$=DATE$(7:8)  
20 IF A$ <> DATE$(7:8)  
30 LET A$=DATE$(7:8)  
40 IF A$="01"  
50 PRINT "IT IS THE FIRST OF THE MONTH"  
60 END IF  
70 END IF  
80 SLEEP 100  
90 GOTO 20
```

**Comments** None

## TIME\$

This function returns the current time in a string.

**Format** TIME\$

**Parameters** N/A

**Returns** This function returns the time of day in format HH:MM:SS (hours:minutes:seconds). If the Real-Time Clock is not installed, an empty string is returned.

**Example:** This is an example of how to use the TIME\$ command:

```
10 PRINT TIME$  
RUN  
10:00:00
```

**Comments** None

## DATE

This function gets the current date as a number.

**Format DATE**

**Parameters** N/A

**Returns** This function returns the current date in **YYYYDDD** format, where **YYYY** is the year and **DDD** is the number of days since the beginning of the year. If the Real-Time Clock is not installed, **0** is returned.

**Example:** This example assumes the current date is January 1, 2003:

```
10 PRINT DATE
RUN
2003001
```

**Comments** None

## TIME

This function gets the current time as a number.

### Format TIME

**Parameters** N/A

**Returns** This function returns the time past midnight (2400h) in seconds. If the Real-Time Clock is not installed, 0 is returned.

This is an example of how to use the TIME command [assuming the time is one minute past midnight]:

**Example:**

```
10 PRINT TIME  
RUN  
60
```

**Comments** None

## Set/Get/Do Interactions

The printer's Set/Get/Do data can be directly accessed via ZBI. For a complete listing of what can be accessed, see *SGD Printer Commands* [on page 609](#), or type the following:

```
! U1 getvar "allcv"
```

Here's a quick list of these commands:

**SETVAR** Allows the direct setting of printer parameters.

**GETVAR\$** Retrieves printer parameters.

## SETVAR

**Description** SETVAR allows the direct setting of printer parameters.

**Format** SETVAR (PARAM\$, VALUE\$)

### Parameters

PARAM\$ = The printer parameter to set.  
VALUE\$ = the value to set

**Returns** Parameter dependent.

**Example:** This is an example of the SETVAR command:

```
AUTONUM 1,1
LET OUTSTR$ = "Processing"
LET LOOPCTR = 200
LET TIMER5 = 17
LET TMP = REGISTEREVENT(TIMER5, 0, 1000)
DO WHILE LOOPCTR > 0
LET EVT = HANDLEEVENT()
IF EVT = TIMER5 THEN
LET A = SETVAR("device.frontpanel.line2",OUTSTR$)
LET OUTSTR$ = OUTSTR$ & "."
IF LEN(OUTSTR$) >16 THEN
LET OUTSTR$ = "Processing"
END IF
END IF
LET LOOPCTR = LOOPCTR - 1
SLEEP 1
LOOP
LET TMP = UNREGISTEREVENT(TIMER5)
LET A = SETVAR("device.frontpanel.line2","")
END
```

**Comments** None

# GETVAR\$

This function retrieves printer parameters.

**Format** GETVAR\$ (PARAM\$)

## Parameters

PARAM\$ = the printer parameter to get.

**Returns** The value of the parameter. Refer to *SGD Printer Commands* [on page 609](#) for specific parameters.

**Example:** This is an example of the GETVAR\$ command:

```
AUTONUM 1,1
LET SGDCOUNT = 7
DECLARE STRING SGDQUERY$ (2,SGDCOUNT)
LET SGDQUERY$ (1,1) = "appl.name"
LET SGDQUERY$ (1,2) = "device.printhead.serialnum"
LET SGDQUERY$ (1,3) = "internal_wired.ip.addr"
LET SGDQUERY$ (1,4) = "internal_wired.ip.netmask"
LET SGDQUERY$ (1,5) = "internal_wired.ip.gateway"
LET SGDQUERY$ (1,6) = "internal_wired.ip.port"
LET SGDQUERY$ (1,7) = "internal_wired.mac_addr"
FOR I = 1 TO SGDCOUNT
LET SGDQUERY$ (2,I) = GETVAR$ (SGDQUERY$ (1,I))
NEXT I
OPEN #1: NAME "ZPL"
PRINT #1: "^XA"
FOR I = 1 TO SGDCOUNT
PRINT #1: "^FO50,";50*I;"^A0N,25,25^FD";SGDQUERY$ (1,I);"=";
PRINT #1: SGDQUERY$ (2,I);"^FS"
NEXT I
PRINT #1: "^XZ"
```

**Comments** None

## Example Programs

The next section provides example programs of common tasks using ZBI commands. These programs are also available for download at: <http://www.zebra.com/zbi>

### Array Program

This program prompts a user to enter first a name; when it is entered, it is added to an array of all names entered. The user is then prompted to enter an address, which is then added to an array of all addresses entered. After the user enters a total of five names and addresses, the program uses the arrays to print the entered data on five labels.

**Example:** This is an example of Array

```
1 rem ****
1 rem Zebra Technologies ZBI Sample Program
1 rem
1 rem Professional programming services are available. Please contact
1 rem ZBI-Experts@zebra.com for more information.
1 rem
1 rem This is an example of using arrays to store and use data within 1 rem ZBI.
1 rem ****
1 rem close all ports except for the console
1 rem ****
10 for i = 1 to 9 step 1
20   close #i
30   next i
1 rem ****
1 rem open a port to the print engine
1 rem ****
40 open #1: name "ZPL"
1 rem ****
1 rem create string arrays five elements in size to hold names and
1 rem addresses
1 rem ****
50 declare string name$(5)
60 declare string address$(5)
1 rem ****
1 rem infinite loop to put name and address data from console into
1 rem arrays
1 rem ****
70 do
80 for i = 1 to 5 step 1
90   print "PLEASE ENTER THE NAME"
1 rem ****
1 rem get data from console; input command looks for CRLF
1 rem ****
100  input name$(i)
1 rem ****
1 rem if the user inputs end or END, the program will end
1 rem ****
110  if name$(i) = "END" or name$(i) = "end" then
120    end
130  end if
140  print "PLEASE ENTER THE ADDRESS"
150  input address$(i)
160  if address$(i) = "END" or address$(i) = "end" then
170    end
180  end if
190 next i
200 for index = 1 to 5 step 1 ! For loop To Print data no label
1 rem ****
1 rem semicolon at the end prints with no CRLF
1 rem ****
210  print #1: "^XA^FO30,30^A0N,30,30^FD"&NAME$(INDEX)&"^FS";
1 rem ****
1 rem ampersand used to concatenate data into strings
1 rem ****

230 next index
```

```
240 loop ! loops back To Line 60
250 end
```

## CSV Program

The following program will initialize and then execute continuously, repeating the same series of operations; process events, read input from the serial port, write any processed data out to the ZPL port, and then process the data read from the serial port.

The program first loads the CSV database E:PRODUCTS.CSV (in PROGRAMINIT subroutine). Then, data read from the serial port is compared against the first column in the database. If an entry is found in the first column of a row (in FINDITEM subroutine), the data for the respective row is inserted into the ZPL format E:PRICELBL.ZPL and printed on a label.

**Example 1:** This is an example of a CSV program.

## DPI Conversion Program

This program converts a ZPL format being sent to the printer on the parallel port to 300 dpi (dots per inch) from 200 dpi (dots per inch). This is done by searching for and extracting ZPL commands with resolution-dependent arguments and scaling the arguments for a 300 dpi printer.

**Example:** This is an example of dpi conversion:

```

1 rem ****
1 rem Zebra Technologies ZBI Sample Program
1 rem

1 rem ****
1 rem main program; look for "START" keyword, if found print ^XA to ZPL port
1 rem ****
90 do
100  let begin$ = searchto$(1,format$,2)
110  if begin$ = "START" then
120    print #2: "^XA";
1 rem ****
1 rem if "DATA" keyword is found, get two data strings
1 rem ****
130  else if begin$ = "DATA" then
140    input #1: data_string1$
150    input #1: data_string2$
1 rem ****
1 rem get data from between quotes and print to ZPL port with formatting
1 rem ****
160  let extracted_data1$ = extract$(data_string1$,"""","""")
170  let extracted_data2$ = extract$(data_string2$,"""","""")
180  print #2:"^FO30,30^A0N,30,30^FD"&extracted_data1$&"^FS";
190  print #2:"^FO30,70^A0N,30,30^FD"&extracted_data2$&"^FS";
200  else if begin$ = "END" then
210    print #2: "^XZ"
220  end if
230 loop

```

## Extraction 2 Program

This program finds and stores data of interest, which in this case is found in a format after the string "DATA = ". The input command is used to get the data from the input stream, and it is inserted into a simple ZPL format to be printed.

**Example:** This is an example of Extraction 2.

# SGD Printer Commands

This chapter provides a high-level overview of printer setting Set / Get / Do (SGD) commands. For printer support of these SGD commands, see [SGD Command Support on page 1365](#).

.15↑

SGD commands are available in printers with the following firmware versions or later:

- V66.17.4Z or later
- V61.15.xZ or later
- V60.16.2Z or later
- V60.15.xZ or later
- V50.15.xZ or later
- V56.15.xZ or later
- V53.16.x or later
- V53.15.2Z or later
- R53.16.3Z or later
- R60.15.8Z or later
- R62.15.8Z or later
- R63.15.8Z or later
- R65.15.8Z or later

**Important** • These are important points to note when using ZPL and SGD commands:

- SGD commands are case-sensitive.
- ZPL and SGD commands should be sent to the printer as separate files.
- Certain settings can be controlled by both ZPL and SGD. Configuration changes made in ZPL can affect configuration changes made in SGD.
- Changes made with one command type (ZPL or SGD) will affect the data returned to the host in response to both ZPL and getvar commands. The command type (ZPL or SGD) that was sent last determines the current setting.
- Some RF cards do not support all of the SGD commands.

**Important** • These are important points to note when using a Zebra G-Series printer:

- You can send instructions to the printer using multiple programming languages: EPL, ZPL, or SGD. EPL and ZPL commands configure the printer, print labels, and get device status information. SGD commands set and get configuration details. These three languages can be used without the need to send the printer instructions to switch from one language to another.
- EPL, ZPL, and SGD commands must be sent to the printer as separate files. They cannot be used together in one format, or set of commands. For example, if you send a series of SGD commands to the printer and they are followed by a printable format, this needs to be done using separate files.

## Overview

This section describes how and why to use the Set / Get / Do (SGD) commands. It also provides an example of a typical command structure.

SGD commands are commands that allow you to configure all printers with firmware versions V60.15.xZ, V50.15.xZ, V61.15.xZ, V56.15.xZ, V53.15.xZ, or later. The printer performs the specified function immediately after receiving the command. The commands are:

- setvar
- getvar
- do

**Important** • SGD commands must be terminated by a carriage return or a space and line feed, and the command, attributes, and values must be specified in lower case.

### setvar Command

**Setvar** commands:

- are used to configure printer settings to specific values by setting them in the printer
- must be terminated by a space character or a CR/ LF (0x0D, 0x0A)

### getvar Command

**Getvar** commands:

- are used to get the current value of the printer settings
- must be terminated by a space character or CR/LF (0x0D, 0x0A)

The printer responds with the printer setting of "?" if:

- the printer setting does not exist (usually due to incorrect spelling of the printer setting)
- it has not been configured yet

### do Command

**Do** commands:

- are used to instruct the printer to perform predefined actions
- must be terminated by a space character or a CR/LF (0x0D, 0x0A)

Some **Do** commands require additional settings which must be enclosed in double quotes.

## Command Structure

It is important to understand the structure of the command and its components. A command structure illustration is provided for each command in this guide.

**Example:** This is an example of a command structure illustration:

|          |                                                                                                                                                                                                                  |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> | Command—always preceded with an exclamation point (!) and must be specified in lower case. A space resides between the ! and <b>U1</b> and between <b>U1</b> and the command ( <b>setvar</b> or <b>getvar</b> ). |
| <b>2</b> | Attribute—always in double quotes and must be specified in lower case.                                                                                                                                           |
| <b>3</b> | Chosen value—always in double quotes. Only applicable for <b>setvar</b> and <b>do</b> .                                                                                                                          |

This command must be terminated by a space character or a CR/ LF (0x0D, 0x0A).

## How to Send Multiple SGD Commands

For any **getvar**, **setvar**, or **do** command, if you issue the syntax without the "1" and use the END command followed by a space, multiple SGD commands are sent simultaneously.

**Example:** This syntax shows how you can send multiple **getvar** commands:

|          |                                                                                                                          |
|----------|--------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> | The command portion of the string does not use the "1" after the "! U".                                                  |
| <b>2</b> | Commands issued after the first command do not require the "! U".                                                        |
| <b>3</b> | The string of commands is terminated by the word "END" with a space after the word, and by a carriage return/ line feed. |

## JSON (JavaScript Object Notation)

JSON (JavaScript Object Notation) is an open standard format that uses human- and machine-readable text for device management. It transmits data objects consisting of elements as attribute-value pairs.

You can use JSON as an alternative to using the SGD (Set-Get-Do) mechanism when reading or writing parameters on QLn and iMZ mobile printers. JSON is a popular open standard for exchanging data objects and is well suited to this task.

The main settings channel for JSON is TCP port 9200, but other ports can be used. JSON commands are processed when received. Up to eight connections are allowed, and all connected ports are active, and the JSON commands will work while the printer is printing.

The port used for JSON can be changed or disabled using [ip.port\\_json\\_config on page 1142](#).

**Note** • JSON is available on all communications ports, unless **line\_print** is enabled, in which case you must use the main TCP JSON port, 9200. If you connect to port 9200, the printer ONLY accepts JSON commands. CPCL, SGD, ZPL, and other command languages . are not supported.

## Configuring JSON Usage for Communications

All JSON commands should follow the JSON specification for escaping, spacing, etc. All JSON commands are prefixed by `{}`. Refer to <http://www.json.org/> for full details on JSON formatting.

By enclosing a variable's value in curly braces, it indicates that the value is an object. Inside the object, you can declare any number of properties using a "name": "value" pairing, separated by colons. Multiple pairings are separated by commas.

Use the SGD variable name in the JSON command structure.

To configure JSON usage for communication, refer to the following examples.

### Getvar using JSON

**Example 1:** To do a getvar in SGD you use the format:

```
! U1 getvar "sgd.name"  
! U1 getvar "ip.port"  
! U1 getvar "device.location"
```

To get a variable value using JSON:

```
{ }{"sgd.name":null} returns {"sgd.name":"value"}  
{ }{"ip.port":null} returns {"ip.port":"9100"}  
{ }{"device.location":null} returns {"device.location":"my desk"}
```

→ **Example 2:** You can get several values as follows:

```
{ }{"device.friendly_name":null, "device.company_name":null,  
"device.company_contact":null, "device.location":null}
```

The response is:

```
{"device.friendly_name":"XXQLJ120900310",  
"device.company_name":"Zebra Technologies",  
"device.company_contact":"123-555-1212",  
"device.location":"My Desk"}
```

## Setvar using JSON

→ **Example 1:** To do a setvar in SGD you use the format:

```
! U1 getvar "sgd.name" "value"  
! U1 getvar "ip.port" "9200"  
! U1 setvar "device.location" "my desk"
```

To set a variable value using JSON:

```
{ }{"sgd.name":"value"} sets the variable value to "value"  
{ }{"ip.port":"1234"} sets the variable value to "1234"  
{ }{"device.location":"my desk"} sets the variable value to "my desk"
```

**Note** • When you set an SGD value, it will return the value that was set, or the old value if the set failed. If:

{ }{"sgd.name": "new\_value"} fails, the variable value remains "old\_value"

→ **Example 2:** To set several values at once:

```
{ }{"device.friendly_name":"XXQLJ120900310",  
"device.company_contact":"123-555-1212", "device.location":"My  
Desk"}
```

The response is:

```
{"device.friendly_name":"XXQLJ120900310",  
"device.company_contact":"123-555-1212", "device.location":"My  
Desk"}
```

## Get an SGD Branch

You can retrieve all branch values by specifying the branch.

→ **Example:**

{ }{"bluetooth":null} returns all SGDs in branch and their values.

## Get an allvalues Report

You can request an **allvalues** report with just the values for all settings with characteristics. This will return all SGDs and their values.

→ **Example:**

```
{ }{"allvalues":  
  {"ip.port":"6101", "ip.port_alternate":"9100",  
   "ip.sgd_json_port":"9200",  
   ...  
 }
```

## Get an allconfig Report

You can request an allconfig report using JSON, and it will return all settings with characteristics.

→ **Example 1:** To get all SGDs and their values along with various other information including defaults:

```
{ }{"allconfig":null}
```

**Note** • For the "allconfig" response, it will start with

```
{"allconfig":{  
  and end with  
  }}
```

→ **Example 2:** If you do an **allconfig**, you can get the setting attributes for all settings as follows:

```
{"allconfig": {"ip.port": {"value": "6101", "type": "integer", "range": "0- 65535", "clone": true, "archive": true, "access": "RW"}, "ip.port_alternate": {"value": "9100", "type": "integer", "range": "0-65535", "clone": true, "archive": true, "access": "RW"}, "ip.sgd_json_port": {"value": "9200", "type": "integer", "range": "0- 65535", "clone": true, "archive": true, "access": "RW"}, another setting, ... the last setting}}
```

where:

- **"value"** = indicates the current value stored in the setting.
- **"type"** = indicates the type of value. Possible values are integer, enum, bool, string, double, ipv4-address, ipv6- address.
- **"range"** = indicates the range of a setting. For strings this is the range of the string length. For enums it is the possible enum values.
- **"clone"** = indicates if it is safe to store this setting and apply it to another link-os printer.
- **"archive"** = indicates if is safe to store this setting and apply it to same link-os printer at a later time.
- **"acces"** = indicates if the setting is RW (read/write), R (read-only), or W (write-only).

→ **Example 3:** If you do an **allconfig**, you can get the setting attributes for all settings as follows:

```
{ }{"allconfig":null}
```

For the values used above it returns these entries:

```
"device.friendly_name": {"value": "XXQLJ120900310", "type": "string", "range": "0-17", "clone": false, "archive": true, "access": "RW"}, "device.company_contact": {"value": "123-555-1212", "type": "string", "range": "0-128", "clone": true, "archive": true, "access": "RW"}, "device.location": {"value": "my desk", "type": "string", "range": "0-128", "clone": true, "archive": true, "access": "RW"},
```

## alerts.add

This command is used to configure the ZebraNet Alert System. It allows Zebra software to add new alerts without having to use the ZPL ^SX command. This allows software to configure printers which do not have ZPL on them, and it provides the software with a single way in for configuring alerts. It also allows the software to configure alerts via local ports such as USB and serial.

The format is similar to the ^SX command. It can delete the alert when both the set and clear flags are set to **FALSE**.

| Commands      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to add the new alert with the configuration specified in the comma delimited list.</p> <p>The parameter is a comma delimited list of the following:</p> <ul style="list-style-type: none"> <li>• The alert condition. This can be any of the values returned from <a href="#">alerts.conditions on page 618</a>.</li> <li>• The alert destination type. This can be any of the value returned from <a href="#">alerts.destinations on page 620</a>.</li> <li>• On Set - Set to Y if the alert should be sent when the event is set</li> <li>• On Clear - Set to Y if the alert should be sent when the event is cleared</li> <li>• Destination address - applies to TCP, UDP, EMAIL, SNMP, SDK, and HTTP POST destination types. The maximum length of this address is 255 characters.</li> <li>• Port - Applies to TCP and UDP types</li> <li>• Quelling - When set to "Y" it prevents the alert from being sent. "N" is the default.</li> <li>• SGD Name - the name of the SGD command to be added. This is valid only when the alert condition is SGD_SET.</li> </ul> <p><b>Format:</b> ! ### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** This example shows a "Paper Out" alert sent via the serial port, with no destination address specified.

```
! U1 setvar "alerts.add" "PAPER OUT,SERIAL,Y,N,,0,,"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## alerts.conditions

This command lists the available conditions that can be specified in the first parameter of the `alerts.add` SGD. See [alerts.add on page 616](#) for information on the various parameters.

| Commands            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## alerts.configured

This command creates a list of all the alerts that are configured on the printer. The alerts are delimited by the ' | ' character.

**Important** • Writing to this SGD will clear out the old alerts and setup the new ones.

| Commands      | Details                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command creates the list of alerts configured on the printer.</p> <p><b>Format:</b><br/> <code>! ### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## alerts.destinations

This command lists the available destinations that can be specified in the first parameter of the `alerts.add` SGD. See the [alerts.add on page 616](#) for information on the various parameters.

| Commands            | Details                                                                                                                                                                                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>getvar</code> | <p>This command returns a comma-delimited list of available alert destinations.</p> <p><b>Format:</b> ! U1 getvar "alerts.destinations"</p> <p><b>Values:</b> SERIAL, PARALLEL, E-MAIL, TCP, UDP, SNMP, USB, HTTP-POST, BLUETOOTH, SDK</p> <p><b>Default:</b> NA</p> |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## alerts.http.authentication.add

This command allows the user to add a single server/username/password triplet into the list of authentication entries.

When the printer attempts to connect to the URL in the HTTP POST alert, the server may require HTTP authentication (such as digest, basic, DNS, etc.). There may be multiple authentication requests along the route to the destination (for example, a local server first requires HTTP authentication as well as on the remote server). For each HTTP authentication request received while attempting to connect, the printer will enumerate the authentication entries and attempt to satisfy the request with the username/password pair provided for the respective server. The server name in the entry is what determines which username/password pair should be used for which authentication request. Both DNS names and IP addresses are acceptable.

The server, username, and password are separated by a single space (not a tab or other white space character). The server name is the only required field. If no username is supplied, but a password is, there must be two spaces between the server and the password fields. If there is a username but no password, or simply just the servername, no space is required at the end of the entry.

| Commands      | Details                                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command adds server/username/password triplet into the list of authentication entries.</p> <p><b>Format:</b><br/> <code>! U1 setvar "alerts.http.authentication.add" "servername[ username][ password]"</code></p> <p><b>Values:</b> Maximum string of 2048 characters.</p> <p><b>Default:</b> NA</p> |
| <b>do</b>     | <p>This command has the same settings as the <b>setvar</b>.</p> <p><b>Format:</b><br/> <code>! U1 do"alerts.http.authentication.add" "servername[ username][ password]"</code></p> <p><b>Values:</b> Maximum string of 2048 characters.</p> <p><b>Default:</b> NA</p>                                         |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example 1:** A username and a password is supplied:

```
! U1 setvar "alerts.http.authentication.add" "my.server.lan
johndoe password"
```

**Example 2:** No password is supplied:

```
! U1 setvar "alerts.http.authentication.add" "my.server.lan
johndoe"
```

→ **Example 3:** No username is supplied (note the double space):

```
! U1 setvar "alerts.http.authentication.add"  
"my.server.lan password"
```

→ **Example 4:** No username or password is supplied:

```
! U1 setvar "alerts.http.authentication.add" "my.server.lan"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.
- For details on HTTP POST, see [HTTP POST Alerts](#) on page 1465.

## alerts.http.authentication.entries

This command lists the server names added to the authentication entries list via **alerts.http.authentication.add**.

Only the server names will be shown; the username and passwords will not be shown. The server names are separated by a **\r\n** so that each shows up on its own line and is easier to read.

| Commands      | Details                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | This command lists the server names added to the authentication entry list.<br><b>Format:</b> ! U1 getvar "alerts.http.authentication.entries"<br><b>Values:</b> A list of server names.<br><b>Default:</b> NA |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).
- For details on HTTP POST, see [HTTP POST Alerts on page 1383](#).

## alerts.http.authentication.remove

This command allows the user to remove a single server/username/password triplet from the list of authentication entries. To remove an entry, only the server name is supplied, and the entire entry will be removed. If an invalid entry is supplied no action is taken.

Note that the list of authentication triplets will be updated (and saved over a reset) but this SGD is just a command and doesn't have state. Therefore the persistent and restore defaults do not apply. The internal list that this command removes from, however, is persistent and defaultable (defaults to an empty list).

| Commands      | Details                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command removes a server/username/password triplet into the list of authentication entries.</p> <p><b>Format:</b> ! U1 setvar "alerts.http.authentication.remove" "servername"</p> <p><b>Values:</b> Maximum string of 2048 characters.</p> <p><b>Default:</b> NA</p> |
| <b>do</b>     | <p>This command has the same settings as the <b>setvar</b>.</p> <p><b>Format:</b> ! U1 do "alerts.http.authentication.remove" "servername"</p> <p><b>Values:</b> Maximum string of 2048 characters.</p> <p><b>Default:</b> NA</p>                                             |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** A username and a password is supplied

```
! U1 setvar "alerts.http.authentication.remove" "my.server.lan"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.
- For details on HTTP POST, see [HTTP POST Alerts](#) on page 1383.

## alerts.http.logging.clear

This command clears the weblink alerts log entries. It does not disable logging. Setting this command to any value, including an empty string, will clear the weblink log entries.

| Commands      | Details                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command clears the weblink alerts log entries.</p> <p><b>Format:</b> ! U1 setvar "alerts.http.logging.clear" "value"</p> <p><b>Values:</b> Any string value, including an empty string.</p> <p><b>Default:</b> NA</p> |
| <b>do</b>     | <p>This command clears the weblink alerts log entries.</p> <p><b>Format:</b> ! U1 do "alerts.http.logging.clear" "value"</p> <p><b>Values:</b> Any string value, including an empty string.</p> <p><b>Default:</b> NA</p>     |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** This example clears the log entries with an empty string value.

```
! U1 setvar "alerts.http.logging.clear" ""
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.
- For details on HTTP POST, see [HTTP POST Alerts](#) on page 1383.

## alerts.http.logging.entries

This command returns the N number of entries in the http log, where N has a maximum value that is set by `alerts.http.logging.max_entries`.

The alerts http log is a collection of events related to sending HTTP POST messages. The log entries range anywhere from general status to errors that prevented a successful connection. Each log entry contains a timestamp for when it was logged by the system. The newest events will appear at the bottom of the list.

| Commands            | Details                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>getvar</code> | <p>This command returns the number of entries in the HTTP log.</p> <p><b>Format:</b> ! U1 getvar "alerts.http.logging.entries"</p> <p><b>Values:</b> NA</p> <p><b>Default:</b> NA</p> |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** This example shows the result from `alerts.http.logging.entries`:

```
[01-03-2013 12:48:59.964] [http] Connected to 10.3.4.58
(10.3.4.58) port 80
[01-03-2013 12:48:59.978] [http] HTTP/1.1 100 Continue
[01-03-2013 12:49:01.999] [http] Closing connection
```

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).
- For details on HTTP POST, see [HTTP POST Alerts on page 1383](#).

## alerts.http.logging.max\_entries

This command specifies the maximum number of individual log entries that will be stored in the `alert.http.logging.entries` command.

**Important** • Changes to this command are immediate and may result in some log entries being lost. If there are N log entries currently in the log, the user sets the max\_entries to M, where M is less than N, the oldest (N-M) log entries will be removed.

| Commands            | Details                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>setvar</code> | <p>This command sets the maximum number of log entries that will be stored.</p> <p><b>Format:</b> ! U1 getvar "alerts.http.logging.max_entries" "value"</p> <p><b>Values:</b> 0 - 10000</p> <p><b>Note</b> • Setting the value to 0 disables logging.</p> <p><b>Default:</b> "0"</p> |
| <code>getvar</code> | <p>This command returns the setting for the maximum number of log entries that will be stored.</p> <p><b>Format:</b> ! U1 getvar "alerts.http.logging.max_entries"</p>                                                                                                               |
| <code>do</code>     | <p>This command sets the maximum number of log entries that will be stored.</p> <p><b>Format:</b> ! U1 do "alerts.http.logging.max_entries" "value"</p> <p><b>Values:</b> 0 - 10000</p> <p><b>Note</b> • Setting the value to 0 disables logging.</p> <p><b>Default:</b> "0"</p>     |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** In this example, `alert.http.logging.max_entries` is then set to 2.

```
[01-03-2013 12:48:59.964] [http] Connected to 10.3.4.58  
(10.3.4.58) port 80  
[01-03-2013 12:48:59.978] [http] HTTP/1.1 100 Continue  
[01-03-2013 12:49:01.999] [http] Closing connection
```

When it is set to 2

```
[01-03-2013 12:48:59.978] [http] HTTP/1.1 100 Continue  
[01-03-2013 12:49:01.999] [http] Closing connection
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.
- For details on HTTP POST, see [HTTP POST Alerts](#) on page 1383.

## alerts.http.proxy

This command assigns the URL of the proxy for any HTTP POST alerts. The proxy server protocol, port, domain, username, and password are all encoded into the URL via the format outlined in RFC2396 (<http://www.ietf.org/rfc/rfc2396.txt>).

The username and password must avoid the invalid characters listed in RFC2396 (e.g. ':', '@', '/', etc). If an invalid character must be used it needs to be escaped using '%' as described in RFC2396.

When the setting is changed, the next HTTP POST alert will use the new value.

| Commands      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

U1 getvar "alerts.http.proxy"</p>                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>do</b>     | <p>This command assigns the proxy URL for HTTP POST alerts.</p> <p><b>Format:</b> ! U1 do "alerts.http.proxy" "http://username:password@mydomain.com:3128/"</p> <p><b>Values:</b> Any valid URL up to 2048 characters<br/>URL format expected: <b>http://[user:pass@]domain[:port]/[path]</b></p> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>• The user:pass, port, and path are all optional.</li> <li>• The default port is 1080.</li> <li>• The default is to omit the username and password.</li> </ul>         |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** Examples of how to connect to various proxy servers:

`http://username:password@mydomain.com:3128/  
http://mydomain.com/`

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.
- For details on HTTP POST, see [HTTP POST Alerts](#) on page 1383.

## alerts.tracked\_settings.clear\_log

This command clears the `alerts.tracked_settings.log`. Setting this command to any value, including an empty string, will clear the `tracked_sgds` log entries.

| Commands            | Details                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>setvar</code> | <p>This command clears the <code>tracked_sgds</code> log entirely.</p> <p><b>Format:</b> ! U1 setvar "alerts.tracked_settings.clear_log" "value"</p> <p><b>Values:</b> Any string value, including an empty string.</p> <p><b>Default:</b> NA</p> |
| <code>do</code>     | <p>This command clears the <code>tracked_sgds</code> log entirely.</p> <p><b>Format:</b> ! U1 do "alerts.tracked_settings.clear_log" "value"</p> <p><b>Values:</b> Any string value, including an empty string.</p> <p><b>Default:</b> NA</p>     |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** This example clears the log entries with an empty string value.

```
! U1 setvar "alerts.tracked_settings.clear_log" ""
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## alerts.tracked\_settings.log\_tracked

This command creates a comma-delimited list of settings for which sets should be logged.

| Commands      | Details                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command sets the list of settings for which sets should be logged.</p> <p><b>Format:</b> ! U1 setvar "alerts.tracked_settings.log_tracked"<br/>"settings.name1,settings.name2..."</p> <p><b>Values:</b> Settings with commas between names.</p> <p><b>Default:</b> ""</p> |
| <b>getvar</b> | <p>This command returns a comma-delimited lists of settings being logged.</p> <p><b>Format:</b> ! U1 getvar "alerts.tracked_settings.log_tracked"</p>                                                                                                                             |
| <b>do</b>     | <p>This command sets the list of settings for which sets should be logged.</p> <p><b>Format:</b> ! U1 do "alerts.tracked_settings.log_tracked" "settings.name1,settings.name2..."</p> <p><b>Values:</b> Settings with commas between names.</p> <p><b>Default:</b> ""</p>         |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## alerts.tracked\_settings.max\_log\_entries

Sets or retrieves the maximum number of entries to be shown in the `alerts.tracked_settings.log`.

| Commands            | Details                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>setvar</code> | <b>Format:</b> ! U1 setvar "alerts.tracked_settings.max_log_entries" "value"<br>! U1 do "alerts.tracked_settings.max_log_entries" "value"<br><b>Values:</b> 0 - 10000<br><b>Default:</b> 100 |
| <code>getvar</code> | <b>Format:</b> ! U1 getvar "alerts.tracked_settings.max_log_entries"                                                                                                                         |

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520, ZQ530
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## alerts.tracked\_sgds.log

This command reports the log of the settings listed in `alerts.tracked_settings.log_tracked`. The log entries will be fully JSON complaint.

| Commands            | Details                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------|
| <code>getvar</code> | This command retrieves the current log.<br><b>Format:</b> ! U1 getvar "alerts.tracked_sgds.log" |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** Sending ! U1 getvar "alerts.tracked\_settings.log" returns:  
`: "[{"settingsName":"newValue","timestamp":"06-24-2012 19:51:28.641"}]" for 1 entry or`  
`"[{"settingsName":"newValue","timestamp":"06-24-2012 19:51:28.641"},\r\n{"settingsName2":"newValue2","timestamp":"06-24-2012 19:51:30.641"}]" for 2 entries.`

**Note** • When the log is empty, the result will be:

""

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## alerts.tracked\_sgds.max\_log\_entries

This command sets the maximum number of entries to be shown in `alerts.tracked_settings.log`.

| Commands      | Details                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command sets the maximum number of alert log entries that will be stored.</p> <p><b>Format:</b> ! U1 setvar "alerts.tracked_sgds.max_log_entries" "value"</p> <p><b>Values:</b> 0 - 10000</p> <p><b>Note</b> • Setting the value to 0 disables logging.</p> <p><b>Default:</b> "100"</p> |
| <b>getvar</b> | <p>This command returns the setting for the maximum number of alert log entries that will be stored.</p> <p><b>Format:</b> ! U1 getvar "alerts.tracked_sgds.max_log_entries"</p>                                                                                                                 |
| <b>do</b>     | <p>This command sets the maximum number of alert log entries that will be stored.</p> <p><b>Format:</b> ! U1 setvar "alerts.tracked_sgds.max_log_entries" "value"</p> <p><b>Values:</b> 0 - 10000</p> <p><b>Note</b> • Setting the value to 0 disables logging.</p> <p><b>Default:</b> "100"</p> |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** This example sets the maximum log entries to 50.

```
! U1 setvar "alerts.tracked_sgds.max_log_entries" "50"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## alerts.tracked\_sgds.zbi\_notified

This command provides a comma-delimited list of settings for which ZBI should be notified when the value is set.

| Commands      | Details                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command sets the list of the settings for which ZBI will be notified when the setting is set.</p> <p><b>Format:</b> ! U1 setvar "alerts.tracked_settings.zbi_notified"<br/>"settings.name1,settings.name2,etc."</p> <p><b>Values:</b> A comma delimited list of settings names</p> <p><b>Default:</b> ""</p> |
| <b>getvar</b> | <p>This command retrieves the list of the settings for which ZBI will be notified when the value is set.</p> <p><b>Format:</b> U1 getvar "alerts.tracked_settings.zbi_notified"</p>                                                                                                                                  |
| <b>do</b>     | <p>This command sets the list of the settings for which ZBI will be notified when the value is set.</p> <p><b>Format:</b> ! U1 do "alerts.tracked_settings.zbi_notified"<br/>"settings.name1,settings.name2,etc."</p> <p><b>Values:</b> A comma delimited list of settings names</p> <p><b>Default:</b> ""</p>       |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## apl.enable

The setvar enables or disables a Virtual Device. The getvar returns the currently enabled Virtual Device.

| Commands   | Details                                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| setvar, do | <b>Format:</b> ! U1 setvar "apl.enable" "value"<br>! U1 do "apl.enable" "value"<br><b>Values:</b> none, apl-d, apl-i, apl-e, apl-l, apl-m, apl-mi, apl-o, apl-t<br><b>Default:</b> NA<br><b>Example:</b> ! U1 setvar "apl.enable" "apl-o" |
| getvar     | <b>Format:</b> ! U1 getvar "alerts.tracked_settings.max_log_entries"                                                                                                                                                                      |

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZT210, ZT220, ZT230, ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## apl.framework\_version

Returns the revision number of the Virtual Device framework.

| Commands | Details                                     |
|----------|---------------------------------------------|
| getvar   | Format: ! U1 getvar "apl.framework_version" |

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZT210, ZT220, ZT230, ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## apl.version

This command returns the revision number of the Virtual Device system.

| Commands      | Details                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | Displays the revision number of the Virtual Device system.<br><b>Format:</b> ! U1 getvar "apl.version" |

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## appl.link\_os\_version

This command lists the version of the Link-OS™ feature set that is supported by the printer.

| Commands      | Details                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | This command retrieves the Link-OS™ version of the printer.<br><b>Format:</b> ! U1 getvar "appl.link_os_version" |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** In this example, the **getvar** command returns version 1.0 of Link-OS™.

```
! U1 getvar "appl.link_os_version"  
returns  
1.0
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## appl.option\_board\_version

This command returns the version number of the firmware running on the wireless option board. For printer support, see [SGD Command Support on page 1365](#).

| Commands      | Details                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | This command returns the version number of the firmware running on the wireless option board.<br><b>Format:</b> ! U1 getvar "appl.option_board_version" |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This command returns the version number of the firmware running on the wireless option board.

```
! U1 getvar "appl.option_board_version"  
"0.0.0 *"
```

## appl.bootblock

**Description** This command refers to the bootblock version. On the configuration label, the bootblock number is identified as the hardware ID. For printer support, see [SGD Command Support on page 1365](#).

| Commands      | Details                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | This command returns the bootblock version number that appears on the configuration label.<br><b>Format:</b> ! U1 getvar "appl.bootblock" |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** returns the bootblock version number.

```
! U1 getvar "appl.bootblock"
```

## appl.date

**Description** This command refers to the date the firmware was created. For printer support, see [SGD Command Support on page 1365](#).

| Commands | Details                                                                                                                                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| getvar   | <p>The printer will respond with the date the firmware was created in the mm/dd/yy format.</p> <p><b>Format:</b> ! U1 getvar "appl.date"</p> <p><b>Format:</b> This is standard <b>text</b>.</p> <p><b>Format:</b></p> |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** returns the date the firmware was created.

```
! U1 getvar "appl.date"
```

Result: "01/29/10"

## appl.name

**Description** This command refers to the printer's firmware version. For printer support, see [SGD Command Support on page 1365](#).

| Commands | Details                                                                                        |
|----------|------------------------------------------------------------------------------------------------|
| getvar   | This command returns the printer's firmware version.<br><b>Format:</b> ! U1 getvar "appl.name" |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** returns the printer's firmware version.

```
! U1 getvar "appl.name"
```

## capture.channel1.count

This command indicates the number of times that `capture.channel1.delimiter` was seen on the port specified in `capture.channel1.port`. Additionally, it indicates how many times `capture.channel1.data.raw` has been updated with user data as well as the number of times we reached the `capture.channel1.max_length`.

This will be shown in the **HZA** response under the capture data section.

| Commands            | Details                                                                                                                                                                                                                                                                                                     |

## capture.channel1.data.raw

This command retrieves the user data captured off of the port specified in **capture.channel1.port**.

Any binary zeros in the capture.data stream will be replaced with the escaped representation of NULL ("\\000"). The delimiter data is not stored as part of the captured data.

This will be shown in the **HZA** output within capture data section.

| Commands      | Details                                                                                                                                                             |

## capture.channel1.delimiter

This command stores the delimiter used to partition data received on the port specified by **capture.channel1.port** and stored in **capture.channel1.data.raw** and **capture.channel1.data.mime**.

This will be reported in the data capture section of the **HZA** response.

| Commands      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command sets the delimiter used to partition data received on the <b>capture.channel1.port</b>.</p> <p><b>Format:</b> ! U1 setvar "capture.channel1.delimiter" "delimiter"</p> <p><b>Values:</b> Any character set up to a maximum of 64 characters in length.</p> <p> <b>Note</b> • Binary data can be used in the delimiter. To do this enter a '\' and then the 3 digit octal value of the character. "\\" = '\' in some tools, so to get \002 you may need to enter "\002". Escaped octal characters count as a single character and not 4 (e.g. a delimiter of "\001\000\002" is 3 characters, not 12)</p> <p><b>Default:</b> "\012"</p> |
| <b>getvar</b> | <p>This command retrieves the delimiter.</p> <p><b>Format:</b> ! ### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** Binary data can be used in the delimiter. To do this enter a '\' and then the 3 digit octal value of the character. Note: "\\" = '\' in some tools, so to get \002 you may need to enter "\002".

"\000" = NULL (single character)  
 "end\015\012\000" = 'e'+'n'+'d'+'\r'+'\n'+ NULL (total of 6 characters)

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## capture.channel1.max\_length

This command sets a length indicating when to copy captured data to the data SGD if the delimiter has not been seen yet.

If the delimiter and the max\_length are reached at the same time, the delimiter will not be part of the captured data. If only part of the delimiter has been received, then the part of the delimiter we have received, will be part of the capture data.

When the max\_length is changed, any data currently in the buffer will be thrown away, and the new value of max\_length will be used.

The Capture Port shall be defaulted to 1000 bytes by any mechanism (including ^JUF, ^JUN, ^JUA, and **device.restore\_defaults**).

| Commands      | Details                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to set a default data capture length.</p> <p><b>Format:</b> ! U1 setvar "capture.channel1.max_length" "value"</p> <p><b>Values:</b> 1-3000</p> <p><b>Default:</b> "1000"</p> |
| <b>getvar</b> | <p>This command retrieves the default data capture length.</p> <p><b>Format:</b> ! U1 getvar "capture.channel1.max_length"</p>                                                                                     |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## capture.channel1.port

This command determines the port that should be monitored for user data. This allows the user to attach an external device, such as a keyboard or barcode scanner, and have input captured into the `capture.channel1.data.raw` command. Once the data is in the SGD they can use it as they would any other SGD (this includes functionality that allows users to be sent an alert when an SGD value changes).

The data received on the specified port will be read until the value in `capture.channel1.delimiter` is seen, at which point the data received until (but not including) the delimiter will be stored in `capture.channel1.data.raw`.

For the port specified in `capture.channel1.port`, no data will be sent to any of the parsers on that port. All data received is assumed to be user input that is to be placed in `capture.channel1.data.raw`. To disable the data capture functionality, set `capture.channel1.port` to "off"

- The delimiter will not be stored in `capture.channel1.data.raw`.
- The port will be shown in the data capture portion of the HZA response.
- The capture port shall be defaulted to "off" by any mechanism (including ^JUF, ^JUA, and `device.restore_defaults`).

| Commands      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** This example sets the command value to "off", preventing it from capturing data.

```
! U1 setvar "capture.channel1.port" "off"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# CISDFCRC16

## Download Files

The **CISDFCRC16** command downloads supported files types to the printer.

**Note** • When using certificate files, your printer supports:

- Using Privacy Enhanced Mail (PEM) formatted certificate files.
- Using the client certificate and private key as two files, each downloaded separately.
- Using exportable PAC files for EAP-FAST.

**Important** • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.

**Important** • Each line should be terminated with a CR/LF.

### Type

```
! CISDFCRC16
<crc>
<filename>
<size>
<checksum>
<data>
```

| Parameters                  | Details                                                                                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <crc> = CRC value           | <b>Values:</b> a four digit CRC value in hexadecimal. If <b>0000</b> is entered, then the CRC validation is ignored. For examples, see below.                                                                                         |
| <filename> = file name      | <b>Values:</b> file name that is stored on the printer's file system. An extension must be specified. Files must be saved to the <b>E:</b> drive.                                                                                     |
| <size> = file size          | <b>Values:</b> an eight digit file size specified in hexadecimal which indicates the number of bytes in the <data> section.                                                                                                           |
| <checksum> = checksum value | <b>Values:</b> a four digit checksum value in hexadecimal. If <b>0000</b> is entered, then the CRC validation is ignored. The checksum value is calculated using the sum of the bytes in the <data> section. For examples, see below. |
| <data> = data               | <b>Values:</b> Binary data saved on the printer's file system as <filename>. Number of bytes in this field must match the <size> parameter.                                                                                           |

**Note** • This command can be used in place of the **~DG** and **~DY** command for more saving and loading options. **~DY** is the preferred command to download TrueType fonts on printers with firmware later than X.13. The **CISDFCRC16** command also supports downloading wireless certificate files.

→ **Example 1:** This example shows the **CISDFCRC16** command used to download a private key file (**privkey.nrd**) to the printer. The different sections of the command are on separate lines.

```

→ **Example 2:** These are examples of CRC and checksum values:

#### CRC example

The value of the **<crc>** field is calculated the CRC-16 for the contents of a specified file using the CRC16-CCITT polynomial which is  $x^{16} + x^{12} + x^5 + 1$ . It is calculated using an initial CRC of 0x0000.

#### checksum example

Given 4 bytes of data : 0x25, 0x62, 0x3F, 0x52:

1. Adding all bytes together gives 0x118.
2. Drop the carry nibble to get 0x18.
3. Get the two's complement of the 0x18 to get 0xE8.  
This is the checksum byte.

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## comm.baud

This command refers to the printer's comm (cable) baud rate. For printer support, see [SGD Command Support on page 1365](#).

**Important** • Once the printer's communication port parameters have been changed, the host terminal must also be configured to match the new printer settings before the host can communicate again.

| Commands      | Details                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to change the baud rate.</p> <p><b>Format:</b> ! U1 setvar "comm.baud" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"9600"</li><li>"19200"</li><li>"38400"</li><li>"57600"</li><li>"115200"</li></ul> <p><b>Default:</b> "19200"</p> |
| <b>getvar</b> | <p>This command instructs the printer to respond with the currently set printer baud rate.</p> <p><b>Format:</b> ! U1 getvar "comm.baud"</p>                                                                                                                                                          |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example 1:** In this example, the **getvar** retrieves the current baud rate.

```
! U1 getvar "comm.baud"
```

**Example 2:** This **setvar** example sets the communications baud rate to 19200 BPS.

```
! U1 setvar "comm.baud" "19200"
```

## comm.halt

This command halts all communications to the serial port if an error condition occurs.

| Commands      | Details                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to halt communication to the printer.</p> <p><b>Format:</b> ! U1 setvar "comm.halt" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"yes"</li><li>"no"</li></ul> <p><b>Default:</b> "yes"</p> |
| <b>getvar</b> | <p>This command returns the current value.</p> <p><b>Format:</b> ! U1 getvar "comm.halt"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"yes"</li><li>"no"</li></ul>                                                                       |

**Example:** This **setvar** example sets the value set to "yes".

```
! U1 setvar "comm.halt" "yes"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## comm.pnp\_option

The **comm.pnp\_option** command configures the RS-232 Serial Port Plug and Play setting on the printer. For printer support, see [SGD Command Support on page 1365](#).

| Commands      | Details                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command instructs the printer to change the <b>comm.pnp_option</b> setting.<br><b>Format:</b> ! U1 setvar "comm.pnp_option" "value"<br><b>Values:</b><br>"off" = sets the printer to not attempt Plug and Play via serial at startup<br>"on" = sets the printer to attempt Plug and Play via serial at startup<br><b>Default:</b> "off" |
| <b>getvar</b> | This command causes the printer to return the current setting for the <b>comm.pnp_option</b> setting.<br><b>Format:</b> ! U1 getvar "comm.pnp_option"                                                                                                                                                                                        |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **setvar** sets the serial port communications state to "on".

```
! U1 setvar "comm.pnp_option" "on"
```

When the setvar value is set to "on", the **getvar** result is "on".

**Note** • Not all Operating Systems and computer hardware support Plug and Play over RS-232 Serial port connections.

## comm.type

This printer setting determines the behavior of the serial port interface. It selects one of three serial communication states: DTE, DCE or Autodetect. For printer support, see [SGD Command Support](#) on page 1365.

| Commands      | Details                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to change the serial port interface type.</p> <p><b>Format:</b> ! U1 setvar "comm.type" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"auto" = Autodetect</li> <li>"dte" = Force DTE (Tx on pin 2)</li> <li>"dce" = Force DCE (Rx on pin 2)</li> </ul> <p><b>Default:</b> "auto"</p> |
| <b>getvar</b> | <p>This command instructs the printer to respond with the current serial port interface type.</p> <p><b>Format:</b> ! U1 getvar "comm.type"</p>                                                                                                                                                                                                       |

### Supported Devices

- LP 2824 Plus

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

**Example 1:** In this example, the **getvar** retrieves the serial port communications state.

```
! U1 getvar "comm.type"
```

**Example 2:** This **setvar** example sets the communications port state to Autodetect.

```
! U1 setvar "comm.type" "auto"
```

## comm.parity

This command sets the printer's communication parity. For printer support, see [SGD Command Support on page 1365](#).

**Important** • Once the printer's communication port parameters have been changed, the host terminal must also be configured to match the new printer settings before the host can communicate again.

| Commands      | Details                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command instructs the printer to set the communication port parity.<br><b>Format:</b> ! U1 setvar "comm.parity" "value"<br><b>Values:</b><br>"N" — None<br>"E" — Even<br>"O" — Odd<br><b>Default:</b> "N" |
| <b>getvar</b> | This command instructs the printer to respond with the currently set printer parity.<br><b>Format:</b> ! U1 getvar "comm.parity"                                                                               |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example 1:** In this example, the **getvar** retrieves the currently set printer parity.

```
! U1 getvar "comm.parity"
```

**Example 2:** This **setvar** example sets the parity to None.

```
! U1 setvar "comm.parity" "N"
```

## comm.stop\_bits

This command refers to the printers's communication port stop bits. For printer support, see [SGD Command Support on page 1365](#).

**Important** • Once the printer's communication port parameters have been changed, the host terminal must also be configured to match the new printer settings before the host can communicate again.

| Commands      | Details                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to configure the comm.port stop bit value.</p> <p><b>Format:</b> ! U1 setvar "comm.stop_bits" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"1"</li><li>"2"</li></ul> <p><b>Default:</b> "1"</p> |
| <b>getvar</b> | <p>This command instructs the printer to respond with the currently set stop bit value.</p> <p><b>Format:</b> ! U1 getvar "comm.stop_bits"</p>                                                                                                                   |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example 1:** In this example, the **getvar** retrieves the currently set stop bit value.

```
! U1 getvar "comm.stop_bits"
```

**Example 2:** This **setvar** example configures the comm.port for 1 stop bit.

```
! U1 setvar "comm.stop_bits" "1"
```

## cradle.comm.baud

Sets or retrieves the cradle serial USB port baud rate.

| Commands | Details                                                                                                                                                                   |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| setvar   | <b>Format:</b> ! U1 setvar "cradle.comm.baud" "value"<br><b>Values:</b> 300,1200,2400,4800,9600,19200,38400,57600,115200,230400,460800,921600<br><b>Default:</b> "115200" |
| getvar   | <b>Format:</b> ! U1 getvar "cradle.comm.baud"                                                                                                                             |

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## cradle.comm.handshake

Sets or retrieves the cradle serial USB port handshake mode.

| Commands      | Details                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <b>Format:</b> ! U1 setvar "cradle.comm.handshake" "value"<br><b>Values:</b> "rts/cts" = use hardware handshake via the request-to-send/clear-to-send pins<br>"xon/xoff" = use software handshake<br>"none" = no flow control<br><b>Default:</b> "rts/cts" |
| <b>getvar</b> | <b>Format:</b> ! U1 getvar "cradle.comm.handshake"                                                                                                                                                                                                         |

### Supported Devices

- ZQ510, ZQ520

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## cutter.clean\_cutter

This command determines if the clean cutter option is enabled or disabled. For printer support, see [SGD Command Support](#) on page 1365.

| Commands      | Details                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to set the clean cutter option.<br/><b>Format:</b> ! U1 setvar "cutter.clean_cutter"<br/><b>Values:</b><br/>"on" = turns on clean cutter<br/>"off" = turns off clean cutter<br/><b>Default:</b> "on"</p> |
| <b>getvar</b> | <p>This command retrieves the status of the clean cutter option.<br/><b>Format:</b> ! U1 getvar "cutter.clean_cutter"</p>                                                                                                                      |

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "cutter.clean_cutter" "on"
```

When the setvar value is set to "on", the getvar result is "on".

## device.applicator.data\_ready

This command will specify if a "high" or "low" value is required for the applicator to indicate it is ready to receive data.

| Commands      | Details                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.data_ready" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.data_ready"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.end\_print

This command allows you to control an online verifier or applicator device. This command is similar to the **b** parameter for [^JJ](#) on page 258.

| Commands      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command sets the value for the applicator port mode</p> <p><b>Format:</b> ! ### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.feed

This command will specify if a "high" or "low" value is required for an applicator to feed media.

| Commands      | Details                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.feed" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.feed"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.media\_out

This command will specify if a "high" or "low" value is required for an applicator to indicate that the media has run out.

| Commands      | Details                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.media_out" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.media_out"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.pause

This command will specify if a "high" or "low" value is required for an applicator to pause printing.

| Commands      | Details                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.pause" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.pause"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.reprint

This command will specify if a "high" or "low" value is required for an applicator to reprint a label. This command is similar to [~PR on page 322](#).

| Commands      | Details                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.reprint" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.reprint"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## device.applicator.rfid\_void

This command will specify if a "high" or "low" value is used for the RFID void signal, which occurs when an RFID label is voided by the printer.

| Commands      | Details                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.rfid_void" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.rfid_void"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.ribbon\_low

This command will specify if a "high" or "low" value is required for an applicator to indicate that the ribbon is running out.

| Commands      | Details                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.ribbon_low" "value"<br><b>Values:</b> high, low<br><b>Default:</b> high |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.ribbon_low"              |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.ribbon\_out

This command will specify if a "high" or "low" value is required for an applicator to indicate that the ribbon has run out.

| Commands      | Details                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.ribbon_out"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.ribbon_out"     |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.service\_required

This command will specify if a "high" or "low" value is required for an applicator to indicate that maintenance is required.

| Commands      | Details                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.service_required" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.service_required"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.applicator.start\_print

This command will specify if a "high" or "low" value is required for an applicator to start printing.

| Commands      | Details                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the value.<br><b>Format:</b> ! U1 setvar "device.applicator.start_print" "value"<br><b>Values:</b> high, low<br><b>Default:</b> low |
| <b>getvar</b> | This command instructs the printer to respond with the currently set value.<br><b>Format:</b> ! U1 getvar "device.applicator.start_print"             |

### Supported Devices

- ZE500™ series
- PAX4™ series
- Xi4™ series
- XilllPlus™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.bluetooth\_installed

Determines if there is a Bluetooth radio installed in the printer.

| Commands | Details                                                                                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| getvar   | <b>Format:</b> ! U1 getvar "device.bluetooth_installed"<br><b>Result:</b> "yes" - a Bluetooth radio is installed in the printer.<br>"no" - no Bluetooth radio is installed. |

### Supported Devices

- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT410, ZT420, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.command\_override.active

This command enables or disables the device.command\_override function. When enabled, the printer will ignore the list of commands previously specified using the device.command\_override.add. Use of this command does not modify the list.

| Commands      | Details                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the the printer to turn on/off <b>device.command_override</b> .<br><b>Format:</b> ! U1 setvar "device.command_override.active" "value"<br><b>Values:</b><br>yes = active<br>no = inactive<br><b>Default:</b> yes |
| <b>getvar</b> | This command returns the active/inactive state of <b>device.command_override</b> .<br><b>Format:</b> ! U1 getvar "device.command_override.active"<br><b>Values:</b><br>yes = active<br>no = inactive<br><b>Default:</b> yes        |

### Examples:

```
! U1 setvar "device.command_override.active" "yes"  
! U1 setvar "device.command_override.active" "no"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.command\_override.add

This command adds a specified command to the list of commands that will be ignored by the printer. The list is saved when the printer is powered off. The list is not cleared when the printer is defaulted.

- If there are items in the list and the `device.command_override.active` is set to "yes", then the config label will show **ACTIVE COMMAND OVERRIDE**.
- If there are no items in the list or `device.command_override.active` is set to "no", then the config label will show **INACTIVE COMMAND OVERRIDE**.

| Commands            | Details                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>setvar</code> | <p>The <code>add</code> command instructs the printer to add a specified command to the list of override commands..</p> <p><b>Format:</b> ! U1 setvar "device.command_override.add" "command"</p> <p><b>Values:</b> any ZPL or Set/Get/Do command</p> <p><b>Default:</b> NA</p> |

→ **Example:** When specifying a ZPL command, the command must be preceded by the current format or control prefix character (e.g. ^ or ~). Multiple commands must be declared with its own setvar declaration.

```
! U1 setvar "device.command_override.add" "^MN"
! U1 setvar "device.command_override.add" "^PR"
! U1 setvar "device.command_override.add" "comm.baud"
! U1 setvar "device.command_override.add" "device.reset"
```

→ **Example:** The following example would **NOT** be valid.

```
! U1 setvar "device.command_override.add" "~HI,~HS,^MN"
```

and would have to be re-sent as

```
! U1 setvar "device.command_override.add" "~HI"
! U1 setvar "device.command_override.add" "~HS"
! U1 setvar "device.command_override.add" "^MN"
```

**Important** • You can not add "`device.command_override.clear`" to the list of accepted override commands.

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.command\_override.clear

This command clears all commands from the command override list.

| Commands      | Details                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | The <b>clear</b> command clears the list of override commands specified in <a href="#">device.command_override.list on page 677</a> .<br><b>Format:</b> ! U1 setvar "device.command_override.clear" "value"<br><b>Values:</b> NA<br><b>Default:</b> NA |

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## device.command\_override.list

This command returns to the host a list of the current set of commands that the printer will ignore.

| Commands      | Details                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | The <b>list</b> command prints a comma-delimited list of override commands.<br><b>Format:</b> ! U1 getvar "device.command_override.list"<br><b>Values:</b> NA<br><b>Default:</b> NA |

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.company\_contact

This command sets the company contact information, which can be accessed from the server/sysinfo.htm webpage.

| Commands | Details                                                                                                                                                                                |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| setvar   | Sets the company contact information.<br><b>Format:</b> ! U1 setvar "device.company_contact" "value"<br><b>Values:</b> Any string up to 128 characters in length<br><b>Default:</b> "" |
| getvar   | Displays the current company contact information.<br><b>Format:</b> ! U1 getvar "device.company_contact"                                                                               |

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

**Example:** This `setvar` example shows the value set to "Zebra".

```
! U1 setvar "device.company_contact" "Zebra"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.configuration\_number

Returns the current SKU number of the printer.

| Commands | Details                                           |
|----------|---------------------------------------------------|
| getvar   | Format: ! U1 getvar "device.configuration_number" |

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.cpcl\_synchronous\_mode

This command enables/disables CPCL synchronous mode. When the printer is in sync mode, parsing will "lock" while printing is going on, allowing behavior similar to that of the legacy SH3 mobile printers.

| Commands      | Details                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the the printer to turn on/off <code>device.cpcl_synchronous_mode</code> .<br><b>Format:</b> ! U1 setvar "evice.cpcl_synchronous_mode" "value"<br><b>Values:</b><br>on = puts the printer in CPCL synchronous mode<br>off = puts the printer in default mode<br><b>Default:</b> off |
| <b>getvar</b> | This command returns the the current value of the setting.<br><b>Format:</b> ! U1 getvar "evice.cpcl_synchronous_mode"                                                                                                                                                                                |

**Supported Devices** QLn™ series

Consider issuing a label immediately followed by an SGD request. When sync mode is "off", the SGD will be returned nearly immediately after submitting the label. When sync mode is "on", the SGD will be returned after the label has printed.

**Examples:**

```
! U1 setvar "evice.cpcl_synchronous_mode" "on"  
! U1 setvar "evice.cpcl_synchronous_mode" "off"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.cutter\_installed

This command reports if a cutter unit is installed.

| Commands      | Details                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | This command checks if a cutter is installed.<br><b>Format:</b> ! U1 getvar "device.cutter_installed"<br><b>Values:</b> Yes or No<br><b>Default:</b> No |

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.download\_connection\_timeout

This command instructs the printer to abort a firmware download if the printer fails to receive any download data in the set amount of seconds. If the set amount of seconds is exceeded, the download will be aborted, and the printer automatically restarts. This command prevents the printer from being locked into the downloading state, if the communication to the host is interrupted. For printer support, see [SGD Command Support on page 1365](#).

| Commands      | Details                                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command instructs the printer to abort a firmware download if the printer fails to receive any download data in the set amount of seconds.<br><b>Format:</b><br><code>! U1 setvar "device.download_connection_timeout" "value"</code><br><b>Values:</b> "0" through "65535"<br><b>Default:</b> "0" ("0" disables this feature) |
| <b>getvar</b> | This command retrieves the connection time out value (in seconds).<br><b>Format:</b><br><code>! U1 getvar "device.download_connection_timeout"</code>                                                                                                                                                                               |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "device.download_connection_timeout" "0"
```

When the **setvar** value is set to "0", the **getvar** result is "0".

# device.epl\_legacy\_mode

This command places the printer in a 2824/2844 compatibility mode for vertical registration.

| Commands       | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar*</b> | <p>This command instructs the printer to change the epl_legacy_mode setting.<br/> <b>Format:</b> ! U1 setvar "device.epl_legacy_mode" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>off</b> = epl_legacy_mode not active</li> <li><b>registration</b> = EPL legacy registration mode on</li> <li><b>print orientation</b> = EPL legacy print orientation mode on</li> <li><b>all</b> = all EPL legacy modes on</li> </ul> <p><b>Default:</b> "off"</p> |
| <b>getvar</b>  | <p>This command causes the printer to return the current setting for the device.epl_legacy_mode setting.<br/> <b>Format:</b> ! U1 getvar "device.epl_legacy_mode"</p>                                                                                                                                                                                                                                                                                                                |

## Supported Devices

- G-Series printers
- LP2824 Plus and TLP 2824 Plus

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

**Example 1:** This setvar example shows the value set to "registration".

```
! U1 setvar "device.epl_legacy_mode" "registration"
```

**Example 2:** This setvar example shows the value set to "print\_orientation".

```
! U1 setvar "device.epl_legacy_mode" "print_orientation"
```

**Example 3:** This getvar example shows the response when the value was set to "registration" and "print\_orientation".

```
! U1 getvar "device.epl_legacy_mode"
"registration, print_orientation"
```

**Example 4:** This getvar example shows the response when value was set to "all"

```
! U1 getvar "device.epl_legacy_mode"
"all"
```

These are the possible responses to getvar "device.epl\_legacy\_mode"

- "off"
- "registration"

- "print\_orientation"
- "registration, print\_orientation"
- "all"

**Note** • This setting is not defaulted as part of a factory default (^JUF or ^default). The setting is persistent across a power cycle or rest (~JR or device.reset).

When setting the "registration" mode, the "print\_orientation" mode is not changed. Likewise, when setting the "print\_orientation" mode, the "registration" mode is not changed. Using "off" or "all" changes all modes.

## Print Orientation Mode

**Note** • When the printer is powered on, the print orientation defaults to ^PON (EPL ZB mode). The print orientation setting is not saved across power cycles. This is different than TLP2844, LP2844, TLP2824, LP2824, and TLP3842 printers. Those printers have a default of ZB (ZPL ^PON mode) and the print orientation setting is saved across power cycles. To make the printer have the print orientation behavior of the TLP2844, LP2844, TLP2824, LP2824, and TLP3842 printers, set the epl\_legacy\_mode to "print\_orientation".

## Registration Mode

**Note** • When printing labels using EPL commands, printing starts 1mm from the top edge of the label (from the gap). This is known as the "no print zone". When printing in ZT mode, the "no print zone" starts at the gap on the leading edge of the label. When printing in ZB mode, the "no print zone" starts from the gap on the trailing edge of the label. In the TLP2844, LP2844, TLP2824, LP2824, and TLP3842 printers, the distance from gap to start of print (the "no print zone") is not always 1mm.

The table below shows the nominal distance.

Distance from Edge of Label to First Print Line (No Print Zone)

| Legacy Printer Model | New Printer Model                | ZT Mode | ZB Mode |
|----------------------|----------------------------------|---------|---------|
| LP2844               | GX420, GK420 (direct thermal)    | 1.9 mm  | 0.0 mm  |
| TLP2844              | GX420, GK420 (thermal transfer)  | 0.4 mm  | 1.6 mm  |
| TLP3842              | GX430 (thermal transfer)         | 0.0 mm  | 1.2 mm  |
| LP2824               | LP 2824 Plus (direct thermal)    | 1.5 mm  | 0.4 mm  |
| TLP2824              | TLP 2824 Plus (thermal transfer) | 0.1 mm  | 1.8 mm  |

af. Setting epl\_legacy\_mode to "registration" selects the distance shown in the table.

ag. Setting epl\_legacy\_mode to "off" selects a no print zone distance of 1mm.

## device.friendly\_name

This command shows the name assigned to the printer. For printer support, see [SGD Command Support on page 1365](#).

| Commands      | Details                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | This command sets the printer's name.<br><b>Format:</b> ! U1 setvar "device.friendly_name" "value"<br><b>Default:</b> "xxxxxxxxxx" ("xxxxxxxxxx" represents the main logic board serial number) |
| <b>getvar</b> | This command retrieves the name assigned to the printer.<br><b>Format:</b> ! U1 getvar "device.friendly_name"                                                                                   |

**Note** • For details on SGD command structure, see [Command Structure on page 983](#).

**Example:** This **setvar** example shows the value set to "xxxxxxxxxx".

! U1 setvar "device.friendly\_name" "xxxxxxxxxx"

When the **setvar** value is set to "xxxxxxxxxx", the **getvar** result is "xxxxxxxxxx".

## device.frontpanel.feedenabled

This command can be used to enable or disable the FEED key or any other key on the printer. For printer support, see [SGD Command Support on page 1365](#).

| Commands      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to change the <b>front_panel.feedenabled</b> setting.</p> <p><b>Format:</b> ! U1 setvar "device.frontpanel.feedenabled"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"yes" = Front Panel keys are enabled</li> <li>"no" = Front Panel keys are disabled</li> </ul> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>"no" = for GX420s printers</li> <li>"yes" = all supported printers except GX420s</li> </ul> <p><b>Power On Default:</b></p> <ul style="list-style-type: none"> <li>"no" = for GX420s printers</li> <li>"yes" = all supported printers except GX420s</li> </ul> |
| <b>getvar</b> | <p>This command retrieves the current setting for the <b>front_panel.feedenable</b> command:</p> <p><b>Format:</b> ! U1 getvar "device.frontpanel.feedenabled"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Supported Devices

- GK420
- GX420, GX430, GX420s
- LP/TLP 2824 Plus,

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **setvar** sets the value to "no".

```
! U1 setvar "device.frontpanel.feedenabled" "no"
```

**Note** • On GX420 printers with an LCD display, there is a SCROLL and SELECT key in addition to the FEED key. Both the SCROLL and SELECT keys are enabled or disabled when the FEED key is enabled or disabled using this command.

**Note** • On power up, for model GX420s printer, the command value is set to "no". For all other printers, on power up, the command value is set to "yes".

## device.frontpanel.key\_press

This command instructs the printer to press a button on the front panel. For printer support, see [SGD Command Support on page 1365](#).

| Commands                                | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                         |             |             |             |            |            |              |                |                  |              |             |            |              |             |            |  |                   |                   |             |             |            |            |              |              |                  |                  |                |                |                 |                 |             |             |            |            |                 |                 |  |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "A".

```
! U1 setvar "device.frontpanel.key_press" "A"
```

## device.frontpanel.line1

This command overrides the content that is shown on the first line of the front panel when the printer is showing the idle display. Use of the **getvar** function is dependent on first using the **setvar** function. For example, to have the first line of the idle display to show HELLO, you must first send a **setvar** command; then a **getvar** command can be sent to retrieve the value HELLO. For printer support, see [SGD Command Support on page 1365](#). For details on the supported character set, see [Character Set on page 1361](#).

|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to set the content that is shown on line one of the front panel.</p> <p><b>Format:</b></p> <pre>! U1 setvar "device.frontpanel.line1" "value"</pre> <p><b>Values:</b> The maximum amount of alphanumeric ASCII characters available for line 1 on the printer's front panel</p> <p><b>Default:</b> ""</p> |
| <b>getvar</b> | <p>This command retrieves the content that is shown on line one of the front panel.</p> <p><b>Format:</b> ! U1 getvar "device.frontpanel.line1"</p>                                                                                                                                                                                             |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "sample line 1".

```
! U1 setvar "device.frontpanel.line1" "sample line 1"
```

When the **setvar** value is set to "sample line 1", the **getvar** result is "sample line 1".

## device.frontpanel.line2

This command overrides the content that is shown on the second line of the front panel when the printer is showing the idle display. Use of the **getvar** function is dependent on using the **setvar** function. For example, to have the second line of the idle display show HELLO, you must first send a **setvar** command; then a **getvar** command can be sent to retrieve the value HELLO. For printer support, see [SGD Command Support on page 1365](#). For details on the supported character set, see [Character Set on page 1361](#).

|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>setvar</b> | <p>This command instructs the printer to set the content that shows on line two of the front panel.</p> <p><b>Format:</b></p> <pre>! U1 setvar "device.frontpanel.line2" "value"</pre> <p><b>Values:</b> The maximum amount of alphanumeric ASCII characters available for line two on the printer's front panel</p> <p><b>Default:</b> ""</p> |
| <b>getvar</b> | <p>This command retrieves the content that shows on line two of the front panel.</p> <p><b>Format:</b> ! U1 getvar "device.frontpanel.line2"</p>                                                                                                                                                                                               |

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "sample line 2".

```
! U1 setvar "device.frontpanel.line2" "sample line 2"
```

When the **setvar** value is set to "sample line 2", the **getvar** result is "sample line 2".

## device.frontpanel.xml

This command retrieves the current content of the front panel in an XML format. For printer support, see [SGD Command Support](#) on page 1365.

| Commands      | Details                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>getvar</b> | This command retrieves the file that determines the representation of the front panel.<br><b>Format:</b> ! U1 getvar "device.frontpanel.xml" |

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

**Example:** In this example, the **getvar** shows the status of the LEDs and the two lines of the front panel in XML formatted text. The text below is formatted for easy reading. When you use this command the response will not contain line feeds.

```
! U1 getvar "device.frontpanel.xml"
```

```
<FRONT-PANEL>
  <LCD>
    <LINE1>PRINTER READY</LINE1>
    <LINE2>V53.16.0</LINE2>
  </LCD>
  <LEDS>
    <PAUSE-LED>STEADY-OFF</PAUSE-LED>
    <DATA-LED>STEADY-OFF</DATA-LED>
    <ERROR-LED>STEADY-OFF</ERROR-LED>
  </LEDS>
</FRONT-PANEL>
```

## device.host\_identification

This command is designed to be sent from the host to the Zebra printer to retrieve information. Upon receipt, the printer responds with information on the model, software version, dots-per-millimeter setting, memory size, and any detected options.

This command is equivalent to the `~HI` ZPL command.

Commands	Details
<code>getvar</code>	<p>This command displays information about the printer.</p> <p><b>Format:</b> <code>! U1 getvar "device.host_identification"</code></p> <p><b>Result:</b> <code>XXXXXX,V1.0.0,dpm,000KB,X</code></p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li><b>XXXXXX = model of Zebra printer</b></li><li><b>V1.0.0 = version of software</b></li><li><b>dpm = dots/mm</b><ul style="list-style-type: none"><li>6, 8, 12, or 24 dots/mm printheads</li></ul></li><li><b>000KB = memory</b><ul style="list-style-type: none"><li><b>512KB</b> = 1/2 MB</li><li><b>1024KB</b> = 1 MB</li><li><b>2048KB</b> = 2 MB</li><li><b>4096KB</b> = 4 MB</li><li><b>8192KB</b> = 8 MB</li></ul></li><li><b>x = recognizable options</b><ul style="list-style-type: none"><li>only options specific to printer are shown (cutter, options, et cetera.)</li></ul></li></ul>

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.host\_status

When this command is sent to the printer, the printer sends three data strings back. To avoid confusion, the host prints each string on a separate line.

This command is similar to the **~HS** ZPL command.

The response for this SGD command does not include the **STX** at the beginning of each data line and does not include the **ETX** at the end of each data line as found in the **~HS** response. Additionally, the first and second response lines for the SGD command contain a **CR/LF** at the end of each line.

**Note** • When the command is sent, the printer will not send a response to the host if the printer is in one of these conditions:

- MEDIA OUT
- RIBBON OUT
- HEAD OPEN
- REWINDER FULL
- HEAD OVER-TEMPERATURE

Commands	Details
<b>getvar</b>	<p><b>Format:</b> ! U1 getvar "device.host_status"</p> <p><b>Result:</b> Three strings, each on their own line.</p> <pre>"aaa,b,c,dddd,eee,f,g,h,iii,j,k,l mmm,n,o,p,q,r,s,t,uuuuuuuu,v,www xxxx,y"</pre> <p><b>Values:</b> See definitions for String 1, String 2, and String 3 below.</p>

### String 1 "aaa,b,c,dddd,eee,f,g,h,iii,j,k,l"

- |             |                                                   |
|-------------|---------------------------------------------------|
| <b>a</b> aa | = communication (interface) settings <sup>a</sup> |
| <b>b</b>    | = paper out flag (1 = paper out)                  |
| <b>c</b>    | = pause flag (1 = pause active)                   |

ah.This string specifies the printer's baud rate, number of data bits, number of stop bits, parity setting, and type of handshaking. This value is a three-digit decimal representation of an eight-bit binary number. To evaluate this parameter, first convert the decimal number to a binary number.

<b>dddd</b>	= label length (value in number of dots)
<b>eee</b>	= number of formats in receive buffer
<b>f</b>	= <i>buffer full flag</i> (1 = receive buffer full)
<b>g</b>	= <i>communications diagnostic mode flag</i> (1 = diagnostic mode active)
<b>h</b>	= <i>partial format flag</i> (1 = partial format in progress)
<b>iii</b>	= unused (always 000)
<b>j</b>	= <i>corrupt RAM flag</i> (1 = configuration data lost)
<b>k</b>	= temperature range (1 = under temperature)
<b>l</b>	= temperature range (1 = over temperature)

ah. This string specifies the printer's baud rate, number of data bits, number of stop bits, parity setting, and type of handshaking. This value is a three-digit decimal representation of an eight-bit binary number. To evaluate this parameter, first convert the decimal number to a binary number.

The nine-digit binary number is read according to this table:

aaa = a <sup>8</sup> a <sup>7</sup> a <sup>6</sup> a <sup>5</sup> a <sup>4</sup> a <sup>3</sup> a <sup>2</sup> a <sup>1</sup> a <sup>0</sup>	
a <sup>7</sup> = Handshake 0 = Xon/Xoff 1 = DTR	a <sup>8</sup> a <sup>2</sup> a <sup>1</sup> a <sup>0</sup> = Baud  0 000 = 110 0 001 = 300 0 010 = 600 0 011 = 1200 0 100 = 2400 0 101 = 4800 0 110 = 9600 0 111 = 19200 1 000 = 28800 ( <i>available only on certain printer models</i> ) 1 001 = 38400 ( <i>available only on certain printer models</i> ) 1 010 = 57600 ( <i>available only on certain printer models</i> ) 1 011 = 14400
a <sup>6</sup> = Parity Odd/Even 0 = Odd 1 = Even	
a <sup>5</sup> = Disable/Enable 0 = Disable 1 = Enable	
a <sup>4</sup> = Stop Bits 0 = 2 Bits 1 = 1 Bit	
a <sup>3</sup> = Data Bits 0 = 7 Bits 1 = 8 Bits	

### String 2 "mmm,n,o,p,q,r,s,t,uuuuuuuu,v,www"

<b>mmm</b>	= function settings <sup>b</sup>
<b>n</b>	= unused
<b>o</b>	= <i>head up flag</i> (1 = head in up position)
<b>p</b>	= <i>ribbon out flag</i> (1 = ribbon out)
<b>q</b>	= <i>thermal transfer mode flag</i> (1 = Thermal Transfer Mode selected)

ai. This string specifies the printer's media type, sensor profile status, and communication diagnostics status. As in String 1, this is a three-digit decimal representation of an eight-bit binary number. First, convert the decimal number to a binary number.

aj. These values are only supported on the Xi4, RXi4, ZM400/ZM600, RZ400/RZ600, and ZT200 Seriesprinters.

<b>r</b>	= Print Mode
	<b>0</b> = Rewind
	<b>1</b> = Peel-Off
.141	<b>2</b> = Tear-Off
	<b>3</b> = Cutter
	<b>4</b> = Applicator
	<b>5</b> = Delayed cut
	<b>6</b> = Reserved <sup>c</sup>
	<b>7</b> = Reserved <sup>c</sup>
	<b>8</b> = Reserved <sup>c</sup>
	<b>9</b> = RFID
<b>s</b>	= print width mode
<b>t</b>	= <i>label waiting flag</i> (1 = label waiting in Peel-off Mode)
<b>uuuuuuuu</b>	= labels remaining in batch
<b>v</b>	= <i>format while printing flag</i> (always 1)
<b>ww</b>	= number of graphic images stored in memory

ai. This string specifies the printer's media type, sensor profile status, and communication diagnostics status. As in String 1, this is a three-digit decimal representation of an eight-bit binary number. First, convert the decimal number to a binary number.

aj. These values are only supported on the Xi4, RXi4, ZM400/ZM600, RZ400/RZ600, and ZT200 Seriesprinters.

The eight-digit binary number is read according to this table:

mmmm = m7 m6 m5 m4 m3 m2 m1 m0	
m7 = Media Type 0 = Die-Cut 1 = Continuous	m4 m3 m2 m1 = Unused 0 = Off 1 = On
m6 = Sensor Profile 0 = Off	m0 = Print Mode 0 = Direct Thermal 1 = Thermal Transfer
m5 = Communications Diagnostics 0 = Off 1 = On	

### String 3 "xxxx,y"

<b>xxxx</b>	= password
<b>y</b>	= 0 (static RAM not installed) 1 (static RAM installed)

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.internal\_wired\_setting\_location

This command identifies the location from where internal\_wired network specific settings should be retrieved.

Commands	Details
<b>setvar*</b>	<p>This command specifies the location from where internal_wired network specific settings should be retrieved.</p> <p><b>Format:</b> ! U1 setvar "device.internal_wired_setting_location" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"network_card"</li> <li>"printer"</li> </ul> <p> <b>Note</b> • "printer" is the only valid option for the QLn series and ZD500 series printers.</p> <p><b>Default:</b> "network_card"</p>
<b>getvar</b>	<p>This command displays the location where internal_wired network specific settings are retrieved from.</p> <p><b>Format:</b> ! U1 getvar "device.internal_wired_setting_location"</p> <p> <b>Note</b> • "printer" is the only valid getvar option for the QLn series and ZD500 series printers.</p>

### Supported Devices

- ZT200™ series
- ZD500™ series
- QLn™ series

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

For printer support, see [SGD Command Support on page 1365](#).

## device.jobs\_print

This command identifies the number of jobs to be printed. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the number of jobs to be printed. <b>Format:</b> ! U1 getvar "device.jobs_print"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** retrieves the jobs currently being printed or last printed.

```
! U1 getvar "device.jobs_print"
```

```
"1"
```

## device.languages

This command identifies the programming language that the printer is currently using.

Commands	Details
<code>setvar</code>	<p>This command instructs the printer to set the printer to the required programming language.</p> <p><b>Format:</b> ! U1 setvar "device.languages" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"epl" = Eltron Programming Language</li> <li>"epl_zpl" = Eltron Programming Language and Zebra Programming Language</li> <li>"zpl" = Zebra Programming Language</li> <li>"hybrid_xml_zpl" = XML and ZPL Programming Languages</li> <li>"apl-d" = Virtual Device-D (only Link-OS printers)</li> <li>"apl-t" = Virtual Device-T (only desktop and table top printers with Link-OS)</li> <li>"apl-e" = Virtual Device-E (only mobile printers with Link-OS)</li> <li>"apl-o" = Virtual Device-O (only mobile printers with Link-OS)</li> <li>"apl-i" = Virtual Device-I (only Link-OS printers)</li> </ul> <p> <b>Important</b> • Not all values are accepted on all printers. Use the ! U1 getvar "allcv" command to see the range of values that your printer supports. Values other than those listed may be available depending on the firmware version being used.</p> <p> <b>Note</b> • "zpl" and "hybrid_xml_zpl" are equivalent. When the setvar is set to "zpl", the getvar result will always be "hybrid_xml_zpl".</p> <p><b>Default:</b> "epl_zpl"</p>
<code>getvar</code>	<p>This command retrieves the programming language that the printer is currently using.</p> <p><b>Format:</b> ! U1 getvar "device.languages"</p>

**Example:** This `setvar` example sets the programming language to "hybrid\_xml\_zpl" using the shorter value of "zpl".

```
! U1 setvar "device.languages" "zpl"
```

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.light.cover\_open\_brightness

This command sets the brightness level for the Cover Open light.

Commands	Details
setvar	<p>Sets the brightness level for the cover open LEDs.</p> <p><b>Format:</b> ! U1 setvar "device.light.cover_open_brightness" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"high" = the LEDs display at maximum brightness when the cover is open</li><li>"medium" = the LEDs display at medium brightness when the cover is open</li><li>"low" = the LEDs display at lowest brightness when the cover is open</li><li>"off" = the LEDs remain off at all times</li></ul> <p><b>Default:</b> "high"</p>
getvar	<p>Retrieves the current brightness level setting for the cover open LEDs.</p> <p><b>Format:</b> ! U1 getvar "device.light.cover_open_brightness"</p>

**Supported Devices** ZT400 series

**Example:** This `setvar` example shows the value set to "low".

```
! U1 setvar "device.light.cover_open_brightness" "low"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.light.head\_open\_brightness

This command sets the brightness level for the Head Open light.

Commands	Details
setvar	<p>Sets the brightness level for the head open LEDs.</p> <p><b>Format:</b> ! U1 setvar "device.light.head_open_brightness" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"high" = the LEDs display at maximum brightness when the head is open</li> <li>"medium" = the LEDs display at medium brightness when the head is open</li> <li>"low" = the LEDs display at lowest brightness when the head is open</li> <li>"off" = the LEDs remains off at all times</li> </ul> <p><b>Default:</b> "high"</p>
getvar	<p>Retrieves the current brightness level setting for the head open LEDs.</p> <p><b>Format:</b> ! U1 getvar "device.light.head_open_brightness"</p>

**Supported Devices** ZT400 series

**Example:** This `setvar` example shows the value set to "medium".

```
! U1 setvar "device.light.head_open_brightness" "medium"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.ltu\_installed

This command checks to see if a Liner Take-Up unit is installed.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.ltu_installed" <b>Values:</b> Yes No <b>Default:</b> No

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.orientation

This printer setting determines the installation orientation of the KR403 printer, either horizontal or vertical. It is intended for use only by the system integrator. Modification by an end user can result in unexpected printer behaviour.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the presenter loop length.</p> <p><b>Format:</b> ! U1 setvar "device.orientation" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>0 = printer is installed horizontally</li> <li>1 = is installed vertically</li> </ul> <p><b>Default:</b></p> <p>0 = printer is installed horizontally (original factory default only, value will not change when defaulting the printer with ^JUF)</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the currently set presenter loop length.</p> <p><b>Format:</b> ! U1 getvar "device.orientation"</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## device.pause

This command stops printing after the current label is complete (if one is printing) and places the printer in Pause Mode.

This command is equivalent to ~PP.

Commands	Details
<b>setvar</b>	This command stops printing and puts the printer in Pause Mode. <b>Format:</b> ! U1 SETVAR "device.pause" "" <b>Values:</b> NA <b>Default:</b> NA
<b>do</b>	This command stops printing and puts the printer in Pause Mode. <b>Format:</b> ! U1 DO "device.pause" "" <b>Values:</b> NA <b>Default:</b> NA

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.pnp\_option

This command defines the type of Plug and Play response that is sent by the printer after the printer is started. The printer must be restarted for a new PNP string to be reported. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to select the desired Plug and Play response option. <b>Format:</b> ! U1 setvar "device.pnp_option" "value" <b>Values:</b> "epl" = Eltron Programming Language "zpl" = Zebra Programming Language <b>Default:</b> "zpl"
<b>getvar</b>	This command retrieves the Plug and Play option setting. <b>Format:</b> ! U1 getvar "device.pnp_option"

**Note** • For GT800 printers only: when the printer's Plug and Play string is set to EPL, the KDU Plus displays 'ONNECTION - EPL Printer (DTE)' even when set to ZPL Forms mode. This behavior only affects the display, not the functionality.

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "zpl".

```
! U1 setvar "device.pnp_option" "epl"
```

When the **setvar** value is set to "epl", the **getvar** result is "epl".

# device.position.accuracy

This printer setting retrieves/sets the accuracy of the geographic position values.

The units of the value depend upon the location provider that was used to determine the geographic coordinates. Usually, this is specified as a radius, in meters, of confidence around the location coordinates. Often, the radius represents a radius of 68% confidence that the true location lies within the circle, representing one standard deviation.

**Note** • These settings hold the value to which they are set, within the range restrictions. The printer does not perform any calculations, nor associate any meaning such as "meters" or "feet" to the values. The values can be determined by a number of methods, including an Android® or iOS® application communicating with the printer using the smart phone's geolocation device.

Commands	Details
<b>setvar</b>	<p>This command sets the accuracy of the geographic position values.</p> <p><b>Format:</b> ! U1 setvar "device.position.accuracy" "value"</p> <p><b>Values:</b> A decimal number with 6 decimal places, e.g. <b>25.370000</b>. The value is saved as a double precision floating point number.</p> <ul style="list-style-type: none"><li>• Minimum: <b>0</b></li><li>• Maximum: <b>406700000</b></li></ul>
<b>getvar</b>	<p>This command retrieves the accuracy of the geographic position values.</p> <p><b>Format:</b> ! U1 getvar "device.position.accuracy"</p>

## Example:

```
! U1 setvar "device.position.accuracy" "25.37"
```

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## device.position.altitude

This printer setting retrieves the altitude above sea level.

The value is in meters above sea level. A positive number indicates a position above sea level. A negative number indicates a position below sea level. The position of sea level depends upon the system used to provide a nominal sea level reference position. This is often the World Geodetic System WGS 84 standard but depends upon the location provider.

Commands	Details
<b>setvar</b>	<p>This command sets the altitude of the printer above sea level.</p> <p><b>Format:</b> ! U1 setvar "device.position.altitude" "value"</p> <p><b>Values:</b> A decimal number with 6 decimal places, e.g. 305.100000 The value is saved as a double precision floating point number.</p> <ul style="list-style-type: none"><li>• Minimum: <b>-10000</b></li><li>• Maximum: <b>406700000</b></li></ul> <p><b>Default:</b> 0.0</p>
<b>getvar</b>	<p>This command retrieves the altitude above sea level.</p> <p><b>Format:</b> ! U1 getvar "device.position.altitude"</p>

### Example:

```
! U1 setvar "device.position.altitude" "305.1"
```

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## device.position.latitude

This printer setting retrieves/sets the geographic latitudinal position.

Commands	Details
<b>setvar</b>	<p>This command sets the latitude position of the printer.</p> <p><b>Format:</b> ! U1 setvar "device.position.latitude" "value"</p> <p><b>Values:</b> The value is in decimal degrees from <b>0.0</b> to <b>+/-90.0</b>.</p> <p><b>Default:</b> 0.0</p>
<b>getvar</b>	<p>This command retrieves the latitude position of the printer.</p> <p><b>Format:</b> ! U1 getvar "device.position.latitude"</p> <p><b>Values:</b> The value is returned with 6 decimal places. A value of <b>0.000001</b> degree is on the order of 0.1 meter of distance on the earth's surface. (The correspondence between degrees and length on the earth's surface varies because the earth is an irregular ellipsoid.)</p>

### Example:

```
! U1 setvar "device.position.latitude" "6.123456"
```

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## device.position.longitude

This printer setting retrieves/sets the geographic longitudinal position.

Commands	Details
<b>setvar</b>	<p>This command sets the longitudinal position of the printer.</p> <p><b>Format:</b> ! U1 setvar "device.position.longitude" "value"</p> <p><b>Values:</b> The value is in decimal degrees from <b>0.0</b> to <b>+/-180.0</b>. The value is saved as a double precision floating point number.</p> <p><b>Default:</b> 0.0</p>
<b>getvar</b>	<p>This command retrieves the longitudinal position of the printer. .</p> <p><b>Format:</b> ! U1 getvar "device.position.longitude"</p> <p><b>Values:</b> The value is returned with 6 decimal places. A value of 0.000001 degree is on the order of no more than 0.1 meter of distance on the earth's surface. (The correspondence between degrees and length on the earth's surface varies from approximately 0.1 meter at the equator to 0.0 at the poles.)</p>

### Example:

```
! U1 setvar "device.position.longitude" "25.123456"
```

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## device.print\_reprogram\_2key

This command determines whether the printer will print a configuration label or 2key report after the printer restarts following a firmware update.

When set to "off" the printer will not print the configuration label or 2key report after the printer is updated.

Commands	Details
<b>setvar</b>	<p>This command sets whether a two-key report is printed or not.</p> <p><b>Format:</b> ! U1 setvar "device.print_reprogram_2key" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"yes"</li> <li>"no"</li> </ul> <p><b>Default:</b> "no"</p>
<b>getvar</b>	<p>This command retrieves the current setting for processing two-key report after printer firmware is reprogrammed.</p> <p><b>Format:</b> ! U1 getvar "device.print_reprogram_2key"</p> <p><b>Result:</b></p> <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>

**Example:** This example disables printing of the two-key report after printer firmware is reprogrammed.

```
! U1 setvar "device.print_reprogram_2key" "no"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.reset

This command instructs the printer to perform a soft reset. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to perform a soft reset. <b>Format:</b> ! U1 setvar "device.reset" ""

**Note** • For details on SGD command structure, see [Command Structure on page 983](#).

**Example:** In this example, the **setvar** performs a soft reset.

```
! U1 setvar "device.reset" ""
```

## device.restore\_defaults

This command restores to the default of all settings within the specified SGD branch. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command restores to the default of all settings within the specified branch.</p> <p><b>Format:</b> ! U1 setvar "device.restore_defaults" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"ip" = default all parameters in the IP branch</li><li>"wlan" = default all parameters in the wlan branch</li><li>"internal_wired" = default all parameters in the internal wired branch</li></ul>
do	<p>This command restores the default setting for all items within the specified branch.</p> <p><b>Format:</b> ! U1 do "device.restore_defaults" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"ip" = default all parameters in the ip branch</li><li>"wlan" = default all parameters in the wlan branch</li><li>"internal_wired" = default all parameters in the internal wired branch</li></ul>

**Note** • For details on SGD command structure, see [Command Structure on page 1043](#).

**Example:** These **do** and **setvar** examples restore the network card's wlan parameters to their default values.

```
! U1 do "device.restore_defaults" "wlan"  
! U1 setvar "device.restore_defaults" "wlan"
```

## device.slot\_1

This command retrieves the type of board installed in the bottom slot of a ZT400 series printer, or in the single expansion slot of a ZT200 series printer.

Commands	Details
getvar	<p>This command retrieves the type of board installed in the bottom slot of a ZT400 series printer, or the expansion slot of a ZT200 series printer..</p> <p><b>Format:</b> ! U1 getvar "device.slot_1"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"empty" = no board installed</li><li>"parallel" = a parallel communications board is installed</li><li>"wired" = a wired PrintServer board is installed</li><li>"wireless" = a wireless PrintServer board is installed</li></ul>

### Supported Devices

- ZT400 series
- ZT200 series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.slot\_2

This command retrieves the type of board installed in the bottom slot of a ZT400 series printer.

Commands	Details
getvar	<p>This command retrieves the type of board installed in the bottom slot.</p> <p><b>Format:</b> ! U1 getvar "device.slot_2"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"empty" = no board installed</li><li>"parallel" = a parallel communications board is installed</li><li>"wired" = a wired PrintServer board is installed</li><li>"wireless" = a wireless PrintServer board is installed</li></ul>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.super\_host\_status

This command returns printer description information in XML format. The printer returns information on format parameters, object directories, individual object data, and print status information.

This command is equivalent to the **^HZA** ZPL command.

Commands	Details
<b>getvar</b>	<b>Format:</b> ! U1 getvar "device.super_host_status" <b>Result:</b> Information on format parameters, object directories, individual object data, and print status information.

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## device.syslog.clear\_log

This setting clears the local syslog.entries SGD. Any log messages previously sent to an ip address are not changed.

Commands	Details
<b>setvar</b>	Clears the local syslog file. <b>Format:</b> ! U1 setvar "device.syslog.clear_log" "" <b>Values:</b> NA <b>Default:</b> NA
<b>do</b>	Clears the local syslog file. <b>Format:</b> ! U1 do "device.syslog.clear_log" "" <b>Values:</b> NA <b>Default:</b> NA

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.syslog.configuration

This setting specifies the location for the syslog messages to be recorded. The location may be either on the printer, or a syslog server IP address.

Commands	Details
<b>setvar</b>	<p>Specifies the location for the syslog messages to be recorded.</p> <p><b>Format:</b> ! U1 setvar "device.syslog.configuration" "value"</p> <p><b>Values:</b> A list of configuration entries, limited to 1000 characters. Entries must be in the form of "<b>severity,destination</b>" and delimited with a semi-colon.</p> <ul style="list-style-type: none"> <li>• SEVERITY - The severity levels, in decreasing severity order, are:           <ul style="list-style-type: none"> <li>• emerg</li> <li>• alert</li> <li>• crit</li> <li>• err</li> <li>• warning</li> <li>• notice</li> <li>• info</li> <li>• debug</li> </ul> </li> <li>• DESTINATION - "local" or a syslog server IP address</li> </ul> <p> <b>Note</b> • When configuring the local syslog report, the first local entry is used and duplicate requests to local are ignored. To configure remote syslog messages you will first need a syslog server to accept them.</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>Retrieves the configuration string setting.</p> <p><b>Format:</b> ! U1 getvar "device.syslog.configuration"</p>

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

→ **Example 1:** This example has emergency syslog messages being sent to an IP location, debug (and all higher severity) syslog messages to another IP address, and critical and higher syslog messages to local storage (either a file or SGD).

```
! U1 setvar "device.syslog.configuration"
"emerg,128.168.0.1;debug,192.168.0.2;crit,local;"
```

→ **Example 2:** This example will only report emergency syslog messages to the local file, and ignore the duplicate location request for critical and higher reports.

```
! U1 setvar "device.syslog.configuration"
"emerg,local;crit,local;"
```

→ **Example 3:** This is an example of a syslog report stored at E:SYSLOG.TXT. Note that device.syslog.save\_local\_file must be enabled.

```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.syslog.enable

This printer setting enables syslog messages.

**Important** • The destination of syslog messages is specified in [device.syslog.configuration](#).

Commands	Details
<b>setvar</b>	Enables or disables syslog. <b>Format:</b> ! U1 setvar "device.syslog.enable" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	Displays whether syslog is enabled. <b>Format:</b> ! U1 getvar "device.syslog.enable"

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "device.syslog.enable" "on"
```

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.syslog.entries

This printer setting displays previously sent syslog messages. If there are no previously sent syslog messages, an empty string is returned.

**Important** • The destination of syslog messages is specified in [device.syslog.configuration](#).

Commands	Details
<b>getvar</b>	<p>Displays previously sent syslog messages.</p> <p><b>Format:</b> ! U1 getvar "device.syslog.entries"</p> <p>The format of each syslog message includes the printer feature, the severity level, the unique message code, and the unique English message. This allows for more advanced systems administrators to filter particular messages of interest. Syslog currently supports unique messages for most printer alerts, WebLink, and some USB Host messages.</p>

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

**Example:** This `getvar` example shows the value of the syslog file.

```
! U1 getvar "device.syslog.entries"
returns
Feb 17 14:28:17: [Power][Informational][0X14] Power On
Feb 17 14:28:19: [Print][Informational][0XF] PQ Job Completed
Feb 17 14:28:20: [Print][Informational][0XF] PQ Job Completed
Feb 17 14:28:20: [Weblink][Informational][0X1005] Weblink
disabled
Feb 17 14:28:34: [Network][Notice][0X1C] Cold Start
```

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.syslog.log\_max\_file\_size

This printer setting specifies the maximum size of the local syslog file.

Commands	Details
<b>setvar</b>	Sets the maximum syslog file size to the specified value. <b>Format:</b> ! U1 setvar "device.syslog.log_max_file_size" "value" <b>Values:</b> A numerical value between 10000 and 400000 <b>Default:</b> "10000"
<b>getvar</b>	Returns the maximum allowed size of the syslog file. <b>Format:</b> ! U1 getvar "device.syslog.log_max_file_size"

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

**Example:** This **setvar** example shows the value set to "200000".

```
! U1 setvar "device.syslog.log_max_file_size" "200000"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.syslog.save\_local\_file

This command saves the contents of the local syslog to E:SYSLOG.TXT.

**Important** • The local destination must be specified in [device.syslog.configuration](#).

Commands	Details
<b>setvar</b>	Specifies whether to save the contents of the local syslog file to E:SYSLOG.TXT. <b>Format:</b> ! U1 setvar "device.syslog.save_local_file" "value" <b>Values:</b> "yes" = the local syslog is saved to E:SYSLOG.TXT "no" = the local syslog is not saved <b>Default:</b> "no"
<b>getvar</b>	Displays the setting for saving the local syslog file to E:SYSLOG.TXT. <b>Format:</b> ! U1 getvar "device.syslog.save_local_file"

**Supported Devices** Link-OS printers with firmware Vxx.19.7Z and later.

**Example:** This **setvar** example shows the value set to "yes".

```
! U1 setvar "device.syslog.save_local_file" "yes"
```

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.feature.bluetooth\_le

Indicates whether or not the printer supports Bluetooth LE.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.feature.bluetooth_le" <b>Values:</b> "present" = a Bluetooth LE radio is installed "not present" = no Bluetooth LE radio is installed "not available" = Bluetooth LE radio is not available on this printer

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.feature.mcr

Indicates if the magnetic card reader is installed and available.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.feature.mcr" <b>Values:</b> "not available" = the magnetic card reader is not available on the printer "not present" = the magnetic card reader is available but not installed "present" = the magnetic card reader is both available and installed on the printer <b>Default:</b> NA

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338, ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.feature.nfc

Indicates if the printer supports the optional Active Near Field Communication (NFC) feature, and if it is currently installed.

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "device.feature.nfc"</p> <p><b>Values:</b> "not available" = active NFC is not supported. "not present" = active NFC is supported, but no reader is installed. "present" = active NFC is supported with a reader is installed.</p> <p><b>Default:</b> NA</p>

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338, ZR638, ZR628
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.feature.ribbon\_cartridge

Indicates if the printer can accept a ribbon cartridge, and if so, if one is installed.

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "device.feature.ribbon_cartridge"</p> <p><b>Result:</b></p> <p>"not available" - the ribbon cartridge is not available on the platform "not present" - the printer is capable of accepting a ribbon cartridge, but one is not currently installed "present" - a ribbon cartridge is installed</p>

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338, ZR638, ZR628
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.idle\_display\_format

Retrieves and sets the front panel's idle display format.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "device.idle_display_format" "value" <b>Values:</b> fw-version,ip-address,mm/dd/yy-24-hr,mm/dd/yy-12-hr,dd/mm/yy-24-hr,dd/mm/yy-12-hr <b>Default:</b> "fw-version" (firmware version)
getvar	<b>Format:</b> ! U1 getvar "device.idle_display_format" <b>Result:</b> fw-version,ip-address,mm/dd/yy-24-hr,mm/dd/yy-12-hr,dd/mm/yy-24-hr,dd/mm/yy-12-h

### Supported Devices

- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.idle\_display\_value

Returns the printer's current front panel idle display information.

Type	Details
getvar	<b>Format:</b> ! U1 getvar "device.idle_display_value" <b>Result:</b> A firmware version, the printer's IP address, or the date.

### Supported Devices

- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.location

Sets the system location, which is used on the "server/sysinfo.htm" webpage.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "device.location" "value" <b>Values:</b> Any ASCII string up to 128 characters. <b>Default:</b> "" (empty string)
getvar	<b>Format:</b> ! U1 getvar "device.location"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.pmcu.revision

Retrieves the Power Micro-Controller Unit's (PMCU) current revision number.

Commands	Details
getvar	Format: ! U1 getvar "device.pmcu.revision"

### Supported Devices

- ZD410, ZD420
- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.print\_2key

Causes the printer to print the mobile configuration report (commonly known as a 2key report).

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "device.print_2key" "" (the set value is ignored)
<b>do</b>	<b>Format:</b> ! U1 do "device.print_2key"

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZQ510, ZQ520
- ZR638, ZR628

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.product\_name\_submodel

Retrieves the product name submodel, which is derived from the Printer Configuration Code (PCC, also known as the SKU).

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.product_name_submodel" <b>Result:</b> "hc" = QLn Healthcare printers "none" = QLn Standard printers and all other printers

### Supported Devices

- ZD500R
- iMZ 220, iMZ 320
- QLn220, QLn320, QLn420
- ZT210, ZT220, ZT230
- ZT410, ZT420
- ZQ510, ZQ520
- ZR628, ZR638

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.prompted\_network\_reset

Reinitializes the wireless radio card and the print server (wired or wireless) when the Wireless or Wireless Plus print server is running. The command also causes any wireless radio card in the printer to re-associate to the wireless network.

This command is equivalent to the [~WR on page 445](#) command.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "device.prompted_network_reset" "value" <b>Values:</b> "yes" = causes the network to reset "no" = no changes to the network

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500, ZD500R
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## device.rewinder\_installed

Determines if a rewind option is installed on the printer.

**Note** • The Rewind Option is not the same as the Liner Take-Up Option.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.rewinder_installed" <b>Result:</b> "yes" = a rewind option is installed "no" = no rewind option installed

### Supported Devices

- QLn320, QLn220
- ZQ510, ZQ520
- ZR638, ZR628
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.save\_2key

Sets or retrieves the current device.save\_2key setting.

**Note** • The two-key report is a configuration listing originally used on legacy mobile printers.

Commands	Details
<b>setvar</b>	<p><b>Format:</b> ! U1 setvar "device.save_2key" "value"</p> <p><b>Values:</b> "on" = Two-key diagnostics reports will be saved to Flash memory whenever a two-key report is printed. The file will be named 2KEY.TXT.          "off" = Two-key reports will not be saved to Flash memory.          "now" = This choice can be used to generate a two-key diagnostics report on demand and save it to Flash memory (save only, does not print). This choice does not alter the "on"/"off" state of this SGD.</p> <p><b>Default:</b> "on"</p>
<b>getvar</b>	Format: ! U1 getvar "device.save_2key"

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220, QLn420
- ZQ510, ZQ520
- ZR638, ZR628

**Example:** This example instructs the printer to generate a two-key diagnostics report and save it to Flash memory.

```
! U1 setvar "device.save_2key" "now"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# device.sensor\_select

Determines which media sensor will be used.

This command is similar to the ^JS ZPL command.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "device.sensor_select" "value" <b>Values:</b> "reflective" "transmissive" <b>Default:</b> "reflective"
getvar	<b>Format:</b> ! U1 getvar "device.sensor_select"

## Supported Devices

- ZD410, ZD420
- ZD500
- ZT230, ZT220, ZT210
- ZT410, ZT420

## Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.serial\_number.option\_board\_date

Returns the date the option board was made.

**Note •** This command is functional only on printers that had their option board manufacturing date programmed when they were created. Older printers that do not have the option board creation date programmed will return a "?" or empty string.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.serial_number.option_board_date" <b>Result:</b> a date in mm/dd/yyyy format.

### Supported Devices

- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZQ510, ZQ520
- ZT210, ZT220, ZT230

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.serial\_numbers.control\_panel\_date

Returns the date the control panel was made.

**Note** • This command is functional only on printers that had their control panel manufacturing date programmed when they were created. Older printers that do not have the control panel creation date programmed will return a "?" or empty string.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.serial_numbers.control_panel_date" <b>Result:</b> a date in mm/dd/yyyy format.

### Supported Devices

- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZQ510, ZQ520
- ZT210, ZT220, ZT230

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.serial\_numbers.mlb\_date

Returns the date the main logic board (MLB) was made.

**Note** • This command is functional only on printers that had their MLB manufacturing date programmed when they were created. Older printers that do not have the MLB creation date programmed will return a "?" or empty string.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "device.serial_numbers.mlb_date" <b>Result:</b> a date in mm/dd/yyyy format.

### Supported Devices

- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZQ510, ZQ520
- ZT210, ZT220, ZT230

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.unique\_id

This command retrieves the printer identifier. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the established printer identifier. <b>Format:</b> ! U1 getvar "device.unique_id"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, assuming the printer's unique ID is 12345, the **getvar** shows "12345".

```
! U1 getvar "device.unique_id"
```

## device.unpause

This command causes a printer in Pause Mode to resume printing. The operation is identical to pressing PAUSE on the control panel of the printer when the printer is already in Pause Mode.

This command is equivalent to `~PS`.

Commands	Details
<code>setvar</code>	<b>Format:</b> <code>! U1 SETVAR "device.pause" ""</code> <b>Values:</b> NA <b>Default:</b> NA
<code>do</code>	<b>Format:</b> <code>! U1 DO "device.unpause" ""</code> <b>Values:</b> NA <b>Default:</b> NA

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.uptime

This command identifies the amount of time the printer has been powered on. The string format is: xx days, xx hours, xx minutes, and xx seconds. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the amount of time the print has been powered on. It responds in the following format (days, hours, minutes, and seconds). <b>Format:</b> ! U1 getvar "device.uptime"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** retrieves the amount of time the printer has been turned on.

```
! U1 getvar "device.uptime"
```

```
"00 days 02 hours 45 mins 30 secs"
```

## device.user\_p1

This command saves and retrieves user specified values. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to set user parameters. <b>Format:</b> ! U1 setvar "device.user_p1" "value" <b>Values:</b> alphanumeric text string (1 - 20) <b>Default:</b> ""
<b>getvar</b>	This command saves and retrieves user specified parameters. <b>Format:</b> ! U1 getvar "device.user_p1"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "test".

**! U1 setvar "device.user\_p1" "test"**

When the **setvar** value is set to "test", the **getvar** result is "test".

## device.user\_p2

This command saves and retrieves user specified values. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to set user parameters. <b>Format:</b> ! U1 setvar "device.user_p2" "value" <b>Values:</b> alphanumeric text string (1 - 20) <b>Default:</b> ""
<b>getvar</b>	This command saves and retrieves user specified parameters. <b>Format:</b> ! U1 getvar "device.user_p2"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "test".

```
! U1 setvar "device.user_p2" "test"
```

When the **setvar** value is set to "test", the **getvar** result is "test".

## device.user\_vars.set\_range

This command complements the `device.user_vars.create` command, allowing a user to change the range of a user-created SGD variable. It has a similar syntax to `device.user_vars.create` with the exception that no default is specified.

Commands	Details
<code>setvar</code>	<p>This command allows the user to change the range of a user-created variable.</p> <p><b>Format:</b> ! U1 setvar "device.user_vars.set_range" "name:type:range"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>• <b>name</b> = the name of the SGD to modify</li> <li>• <b>type</b> = Must be the same type for 'name' as when it was created</li> <li>• <b>range</b> = x-y (for all but UPDOWNCHOICES and CHOICES) or a,b,c,d (for CHOICES and UPDOWNCHOICES)</li> <li>• If no range is specified then it will delete whatever range is currently specified.</li> </ul> <p><b>Default:</b> NA</p>

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Example:** This example modifies my\_var to:

```
device.user_vars.my_var : b , Choices: a,b,c,d,e
! U1 setvar "device.user_vars.set_range"
"my_var:CHOICES:a,b,c,d,e"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# device.user\_vars.create

This command creates a user variable with the specified name, type, range, and default value. The root SGD location for user variables is "**device.user\_vars**".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to create a user variable with the specified parameters.</p> <p><b>Format:</b> ! U1 setvar "device.user_vars.create" "name:type:range:defaultValue"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>• <b>name</b> = the name of the SGD to appear in device.user_vars. The name can be anything from 1 to 64 printable ASCII characters. Any '.' within the name will be replaced with '_'. (e.g. "<b>john.doe</b>" will be changed to "<b>john_-doe</b>". The name must be unique in the device.user_vars branch or it will not be created. The name will be converted to lower case.)</li> <li>• <b>type</b> = one of STRING, INTEGER, DOUBLE, CHOICES, UPDOWNCHOICES, UPDOWNINTEGER, UPDOWNDOUBLE. The type must be one of these types or the variable will not be created. <ul style="list-style-type: none"> <li>• STRING - For strings the range indicates the min/max length of the data that can be stored. If the range is left blank, the default range is a string length of 0-1024. There is no maximum string length, however, if large data is placed into the variables the user should be aware that system memory and performance will be affected. Strings larger than available system memory will not be stored. Values should attempt to stay around, or below, 5K.</li> <li>• INTEGER/UPDOWNINTEGER - For integers the range can be any number expressed by a 32-bit integer, signed or unsigned. If the range is left blank then a range of -32768 to 32767 will be used.</li> <li>• DOUBLE/UPDOWNDOUBLE - A double can be any value within the range of +/-1.7e308. If the range is left blank then a range of -32768.0 to 32767.0 will be used.</li> <li>• CHOICES/UPDOWNCHOICES - Choices must be specified in a comma delimited list. The range cannot be blank if the type is CHOICES or UPDOWNCHOICES.</li> </ul> </li> <li>• <b>range</b> = Expressed as x-y. The range of a variable depends upon the type. Some types will create default ranges, while others will fail to be created if the range is invalid or not specified.</li> <li>• <b>default</b> = the default value for the variable. The value must fall within the range specified or the variable will not be created. If the type is INTEGER, UPDOWNINTEGER, DOUBLE, UPDOWNDOUBLE the default value will be 0 if not specified. For STRING the default value will be an empty string if it is not specified. CHOICES and UPDOWN-CHOICES must have a default value and it must be one of the choices within the specified range.</li> <li>• All four parts of the creation string must be present (some can be empty) meaning that there must be three delimiter characters (':') present. There is no error shown or indicated otherwise when the variable is not created for some reason. If the variable is not created one of the rules listed above has been violated.</li> <li>• Any user variables will be deleted from the device.user_vars branch on a power cycle (they won't be recreated on the next power up).</li> <li>• Defaulting the user_vars branch will restore the consumers back to their defaulted values and will not remove them from the user_vars branch.</li> </ul> <p><b>Default:</b> NA</p>

## Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

→ **Example:** To create a user variable named **userVar1** that is an integer with a minimum of 1, a maximum of 10, and a default/initial value of 5, issue this command:

```
! U1 setvar "device.user_vars.create" "userVar1:INTEGER:1-10:5"
```

After issuing the above “create” command the **device.user\_vars.userVar1** SGD will be present in an ALLCV response.

After issuing the above “create” command the **device.user\_vars.userVar1** SGD may be set via:

```
! U1 setvar "device.user_vars.userVar1" "2"
```

After issuing the above “create” command the “**device.user\_vars.userVar1**” SGD may be retrieved via:

```
! U1 getvar "device.user_vars.userVar1"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## device.xml.enable

This command enables and disables language parsing support for XML. When enabled (on), the printer will parse both ZPL and XML. When disabled (off), the printer will not parse XML data. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to disable or enable the language parsing support for XML.</p> <p><b>Format:</b> ! U1 getvar "device.xml.enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"on" = enables language parsing support for XML</li><li>"off" = disables language parsing support for XML</li></ul> <p><b>Default:</b> on</p>
<b>getvar</b>	<p>This command enables and disables language parsing support for XML.</p> <p><b>Format:</b> ! U1 getvar "device.xml.enable"</p>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the language parsing support for XML set to "on".

```
! U1 setvar "device.xml.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is language parsing support for XML set to "on".

## display.backlight

This parameter determines if the printer display backlight will be active. Valid only on printers with a display installed.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn on or off the backlight display. <b>Format:</b> ! U1 setvar "display.backlight" "value" <b>Values:</b> on, off <b>Default:</b> on
<b>getvar</b>	This command returns if the display backlight is on or off.. <b>Format:</b> ! U1 getvar "display.backlight"

**Example:** This example sets the backlight display to "on".

```
! U1 setvar "display.backlight" "on"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## display.backlight\_on\_time

This command sets the amount of time before the backlight turns off. Valid only on printers with a display installed.

Commands	Details
<b>setvar</b>	<p>This command sets the display length in seconds.</p> <p><b>Format:</b> ! U1 setvar "display.backlight_on_time" "time"</p> <p><b>Values:</b> 0-8191</p> <p><b>Default:</b> 0</p> <p> <b>Note •</b> If the value is set to 0, the backlight will remain on.</p>
<b>getvar</b>	<p>This command returns the display length in seconds.</p> <p><b>Format:</b> ! U1 getvar "display.backlight_on_time"</p>

**Example:** This **setvar** example shows the value set to one minute (60 seconds).

```
! U1 setvar "display.backlight_on_time" "60"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## display.language

This command sets the display language for the control panel. This is equivalent to the ^KL ZPL command.

Commands	Details
<b>setvar</b>	<p>This command sets the display language for the front panel.</p> <p><b>Format:</b> ! U1 setvar "display.language" "language"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"english"</li> <li>"spanish"</li> <li>"french"</li> <li>"german"</li> <li>"italian"</li> <li>"norwegian"</li> <li>"portuguese"</li> <li>"swedish"</li> <li>"danish"</li> <li>"spanish2" (<i>same as Spanish</i>)</li> <li>"dutch"</li> <li>"finnish"</li> <li>"japanese"</li> <li>"korean"</li> <li>"simplified chinese"</li> <li>"traditional chinese"</li> <li>"russian"</li> <li>"polish"</li> <li>"czech"</li> <li>"romanian"</li> </ul> <p><b>Default:</b> "english"</p>
<b>getvar</b>	<p>This command returns the currently set display language.</p> <p><b>Format:</b> ! U1 getvar "display.language"</p>

ak.These values are only supported on the ZT200 Series, Xi4, RXi4, ZM400/ ZM600, and RZ400/RZ600 printers.

**Example:** This **setvar** example shows the value set to "dutch".

```
! U1 setvar "display.language" "dutch"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## display.load\_card

This command loads a specific card from a WML file.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "display.load_card" "value" <b>Values:</b> A valid WML filename and card within the WML filename. <b>Note •</b> The card name is case sensitive. 

### Example:

```
! U1 setvar "display.load_card" "BLUETOOTH.WML#bluetooth2"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## display.password\_level

Controls which front panel items are protected by a password.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "display.password_level" "value" <b>Values:</b> "all" = all front panel items are protected by a password "none" = no front panel items are protected by a password "selected" = front panel items that have the password attribute set to "on" in their WML script are protected by a password <b>Default:</b> "selected" for QLn420, QLn220HC, QLn320HC, ZR628, and ZR638 "none" for all other supported printers
<b>getvar</b>	<b>Format:</b> ! U1 getvar "display.password_level"

### Supported Devices

- QLn420, QLn220HC, QLn320HC
- ZD500, ZD500R
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# display.password.level

Controls when to display the password WML card on the LCD display.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "display.password.level" "value" <b>Default:</b> "selected" - QLn420, QLn320 Healthcare, and QLn220 Healthcare "none" - all other platforms <b>Values:</b> "all" - The user will always be prompted to enter a password when a field is to be modified. "none" - The user will not be prompted to enter a password on the LCD display. "selected" - The user will be prompted to enter a password only if the WML card contains a password = "on" attribute and the user attempts to change a setting.
<b>getvar</b>	<b>Format:</b> ! U1 getvar "display.password.level"

## Supported Devices

- QLn220, QLn320, QLn420
- ZT230
- ZT410, ZT420
- ZD500

## Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## display.root\_wml

This command specifies which control file is first processed by the printer's front panel.

Commands	Details
<b>setvar</b>	<p><b>Format:</b> ! U1 setvar "display.root_wml" "value"</p> <p><b>Values:</b> Any file name with a maximum of 128 characters in length.</p> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>• Z:INDEX420.WML for the QLn420 printers</li> <li>• Z:INDEX320.WML for the QLn220 and QLn320 printers</li> <li>• Z:INDEX.WML for all other printers</li> </ul> <p>If the value is "" on power-up, then Z:INDEX.WML is used.</p>
<b>getvar</b>	<b>Format:</b> ! U1 getvar "display.root_wml"

### Supported Devices

- QLn220, QLn320, QLn420
- ZR638
- ZR628

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## display.text

This command retrieves the text data that is being used on the printer's LCD. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the text data that appears on the printer's LCD. <b>Format:</b> ! U1 getvar "display.text"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** displays text content that appears on the printer's LCD.

```
! U1 getvar "display.text"
```

```
"PRINTER READY V60.16.4Z"
```

## ezpl.head\_close\_action

This command sets what happens to the media after the printhead is closed and the printer is taken out of pause.

This command is similar to the `^MF` ZPL command.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer on which action to perform when the printhead is closed.</p> <p><b>Format:</b> ! U1 setvar "ezpl.head_close_action" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"<b>feed</b>" = feed to the first web after sensor</li> <li>"<b>calibrate</b>" = is used to force a label length measurement and adjust the media and ribbon sensor values.</li> <li>"<b>length</b>" = is used to set the label length. Depending on the size of the label, the printer feeds one or more blank labels.</li> <li>"<b>no motion</b>" = no media feed</li> <li>"<b>short cal</b>" = short calibration</li> </ul> <p><b>Default:</b> "calibrate"</p>
<b>getvar</b>	<p>This command returns the currently set action to be performed when the printhead is closed.</p> <p><b>Format:</b> ! U1 getvar "ezpl.head_close_action"</p>

**Example:** This `setvar` example sets the calibration method to short calibration.

```
! U1 setvar "ezpl.head_close_action" "short cal"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.label\_length\_max

This command sets the maximum label length in inches.

This command is equivalent to the ^ML ZPL command.

Commands	Details
<b>setvar</b>	This command sets the maximum label length in inches. <b>Format:</b> ! U1 setvar "ezpl.label_length_max" "value" <b>Values:</b> 1.0 to 39.0 <b>Default:</b> "39"
<b>getvar</b>	This command retrieves the current maximum label length setting in inches. <b>Format:</b> ! U1 getvar "ezpl.label_length_max"

**Example:** This example sets the label length to 6.2 inches.

```
! U1 setvar ezpl.label_length_max" "6.2"  
! U1 setvar ezpl.label_length_max" "14"
```

**Note** • Values can be expressed to one decimal place.

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.label\_sensor

This command sets the paper out threshold value.

Commands	Details
<b>setvar</b>	This command sets the paper out threshold value. <b>Format:</b> ! U1 setvar "ezpl.label_sensor" "value" <b>Values:</b> "0" to "255", interger values only <b>Default:</b> "70"
<b>getvar</b>	This command retrieves the currently set paper out threshold value. <b>Format:</b> ! U1 getvar "ezpl.label_sensor"

**Example:** This **setvar** example shows the value set to **50**.

```
! U1 setvar "ezpl.label_sensor" "50"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.manual\_calibration

This command initiates a manual calibration sequence.

Commands	Details
<b>setvar</b>	This command instructs the printer to initiate a manual calibration. <b>Format:</b> ! U1 setvar "ezpl.manual_calibration" "" <b>Values:</b> NA <b>Default:</b> NA
<b>do</b>	This command instructs the printer to initiate a manual calibration. <b>Format:</b> ! U1 do "ezpl.manual_calibration" "" <b>Values:</b> NA <b>Default:</b> NA

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.media\_type

This command specifies the media type being used.

This command is similar to the ^MN ZPL command.

Commands	Details
<b>setvar</b>	<p>This command sets the media type used in the printer. <b>Format:</b> ! U1 setvar "ezpl.media_type" "value" <b>Values:</b> "continuous" "gap/notch" "mark" <b>Default:</b> "gap/notch"</p>
<b>getvar</b>	<p>This command returns the current media type setting. <b>Format:</b> ! U1 getvar "ezpl.media_type"</p>

**Example:** This **setvar** example sets the media type to "**continuous**".

```
! U1 setvar "ezpl.media_type" "continuous"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.power\_up\_action

This command sets what happens to the media when the printer is powered on.

This command is similar to the ^MF ZPL command.

Commands	Details
<b>setvar</b>	<p>This command sets the media motion and calibration setting at printer power up.</p> <p><b>Format:</b> ! U1 setvar "ezpl.power_up_action" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"calibrate"</li><li>"feed"</li><li>"length"</li><li>"no motion"</li><li>"short cal"</li></ul> <p><b>Default:</b></p> <ul style="list-style-type: none"><li>"calibrate"</li></ul>
<b>getvar</b>	<p>This command returns the current power up media motion and calibration settings.</p> <p><b>Format:</b> ! U1 getvar "ezpl.power_up_action"</p>

**Example:** This **setvar** example sets the power up calibration setting to "length".

```
! U1 setvar "ezpl.power_up_action" "length"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.print\_method

This command sets the print method.

This command is similar to `^MT`.

Commands	Details
<b>setvar</b>	<p>This command sets the print method.</p> <p><b>Format:</b> <code>! U1 setvar "ezpl.print_method" "value"</code></p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li><code>"thermal trans"</code></li><li><code>"direct thermal"</code></li></ul> <p><b>Default:</b> <code>"thermal trans"</code></p>
<b>getvar</b>	<p>This command retrieves the current print method setting.</p> <p><b>Format:</b> <code>! U1 getvar "ezpl.print_method"</code></p>

**Example:** This `setvar` example sets the print method to `"direct thermal"`.

```
! U1 setvar ezpl.print_method" "direct thermal"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.print\_width

This command sets the print width of the label.

Commands	Details
<b>setvar</b>	This command sets the print width.. <b>Format:</b> ! U1 setvar "ezpl.print_width" "value" <b>Values:</b> any printhead width <b>Default:</b> the width of the printhead
<b>getvar</b>	This command retrieves the current print width setting. <b>Format:</b> ! U1 getvar "ezpl.print_width"

**Example:** This **setvar** example sets the print width value to 3.

```
! U1 setvar "ezpl.print_width" "3"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.reprint\_mode

This command turns on/off the reprint mode.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn on or off reprint mode. <b>Format:</b> ! U1 setvar "ezpl.reprint_mode" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	This command retrieves the current setting for reprint mode. <b>Format:</b> ! U1 getvar "ezpl.reprint_mode"

### Supported Devices

- iMZ220 / iMZ320
- QLn220 / QLn320
- ZD500
- ZT200 series
- ZT400 series

**Example:** This **setvar** example turns reprint mode on.

```
! U1 setvar "ezpl.reprint_mode" "on"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.take\_label

This command sets the take label position.

Commands	Details
setvar	<p>This command sets the take label position .</p> <p><b>Format:</b> ! U1 setvar "ezpl.take_label" "value"</p> <p><b>Values:</b> "0" to "255"</p> <p><b>Default:</b> "50"</p>
getvar	<p>This command retrieves the take label position.</p> <p><b>Format:</b> getvar "ezpl.take_label"</p>

**Example:** This example sets the take label position to 175.

```
! U1 setvar "ezpl.take_label" "175"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ezpl.tear\_off

This command retrieves the tear-off position.

Commands	Details
<b>setvar</b>	This command sets the tear-off position. <b>Format:</b> ! U1 setvar "ezpl.tear_off" "value" <b>Values:</b> "-120" to "120" <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the currently set tear-off position. <b>Format:</b> ! U1 getvar "ezpl.tear_off"

**Example:** This **setvar** example sets the tear-off value to 110.

```
! U1 setvar "ezpl.tear_off" "110"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## file.delete

This command instructs the printer to delete specified files. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
do	<p>This command instructs the printer to delete specified files.</p> <p><b>Format:</b> ! U1 do "file.delete" "value"</p> <p><b>Values:</b> file name</p> <p> <b>Important</b> • Be sure to always specify the memory location.</p>

**Note** • For details on SGD command structure, see [Command Structure on page 983](#).

**Example:** This do example shows the specified file to delete.

```
! U1 do "file.delete" "e:abcd.zpl"
```

## file.dir

This command displays a directory listing on the same port the command was received. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command sets the directory name from which to retrieve files.</p> <p><b>Format:</b> ! U1 setvar "file.dir" "value"</p> <p><b>Values:</b> directory letter</p> <p> <b>Important</b> • Be sure to always specify the memory location.</p>
getvar	<p>This command retrieves a directory listing of the specified directory.</p> <p><b>Format:</b> ! U1 getvar "file.dir"</p> <p> <b>Important</b> • Be sure to always specify the memory location.</p>
do	<p>This command sets the directory name from which to retrieve files.</p> <p><b>Format:</b> ! U1 do "file.dir" "value"</p> <p><b>Values:</b> directory letter</p> <p> <b>Important</b> • Be sure to always specify the memory location.</p>

**Note** • For details on SGD command structure, see [Command Structure on page 983](#).

**Example:** This **do** example shows the directory listing of the specified directory.

```
! U1 do "file.dir" "R:"
```

- DIR R:.\*.\*
- 11172192 bytes free R: RAM

## file.dir\_format

This command controls the output format of the **file.dir** Set/Get/Do command.

Commands	Details
setvar	<p>This command sets the output format.</p> <p><b>Format:</b> ! U1 setvar "file.dir_format" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"cpcl"</li><li>"zpl"</li></ul>
getvar	<p>This command retrieves the current setting for the output format.</p> <p><b>Format:</b> ! U1 getvar "file.dir_format"</p> <p><b>Result:</b></p> <ul style="list-style-type: none"><li>"cpcl"</li><li>"zpl"</li></ul>
do	<p>This command sets the output format.</p> <p><b>Format:</b> ! U1 do "file.dir_format" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"cpcl"</li><li>"zpl"</li></ul>

**Example:** This **do** example sets the directory format to CPCL.

```
! U1 do "file.dir_format" "cpcl"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## file.type

This command displays the contents of the specified file. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to display the content of a file on the same port the command was received.</p> <p><b>Format:</b> ! U1 setvar "file.type" "value"</p> <p><b>Values:</b> the drive letter, file name, file extension, such as <b>R:TEST.ZPL</b></p> <p><b>Important</b> • Be sure to always specify the memory location.</p>
<b>do</b>	<p>This command displays the content of a file on the same port the command was received.</p> <p><b>Format:</b> ! U1 do "file.type" "value"</p> <p><b>Values:</b> the drive letter, file name, file extension, such as <b>R:TEST.ZPL</b></p> <p><b>Important</b> • Be sure to always specify the memory location.</p>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "R:TEST.ZPL".

**! U1 setvar "file.type" "R:TEST.ZPL"**

When the **setvar** value is set to "R:TEST.ZPL", the contents of the file **TEST.ZPL** located on the **R:** drive will be displayed.

## file.run

This command instructs the printer to send a specified file to the parser. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to send a specified file to the parser.</p> <p><b>Format:</b> ! U1 setvar "file.run" "values"</p> <p><b>Values:</b> drive:filename.extension</p> <p> <b>Important</b> • Be sure to always specify the memory location.</p>
<b>do</b>	<p>This command instructs the printer to send a specified file to the parser.</p> <p><b>Format:</b> ! U1 do "file.run" "value"</p> <p><b>Values:</b> drive:filename.extension</p> <p> <b>Important</b> • Be sure to always specify the memory location.</p>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example will send the file "text.zpl" stored in RAM to the parser.

```
! U1 setvar "file.run" "R:text.zpl"
```

## formats.cancel\_all

The ~JA command cancels all format commands in the buffer. It also cancels any batches that are printing.

This command is equivalent to the ~JA ZPL command.

Commands	Details
<b>setvar</b>	This command cancels all format commands in the buffer. <b>Format:</b> ! U1 setvar "formats.cancel_all" "" <b>Values:</b> NA <b>Default:</b> NA
<b>do</b>	This command cancels all format commands in the buffer. <b>Format:</b> ! U1 do "formats.cancel_all" ""

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## head.element\_test

This command will cause the printer to immediately run the head test on all printhead elements. The command can also display the result of the last head element test.

Commands	Details
do	<b>Format:</b> ! U1 do "head.element_test" ""
getvar	<b>Format:</b> ! U1 getvar "head.element_test" <b>Values:</b> The possible getvar responses include: "Head Elements OK" - All head elements passed the test. "n, n..." - a comma-separated list of elements that failed the test. "Initialization Failed" - the test could not start. "Failed to Attach" - the test could not start. "Please Run Test" - default response if there are no results to display. "In Progress" - The element test has been started but not completed yet. <b>Default:</b> "Please Run Test"

### Supported Devices

- ZQ510, ZQ520

**Example:** This example shows a single element that failed the test.

"86"

**Example:** This example shows a list of elements that failed the test.

"75,309,456,778,779"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## head.latch

This command identifies if the printhead is open or closed. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the status of the printhead, open or closed. <b>Format:</b> ! U1 getvar "head.latch" <b>Values:</b> "ok" = closed "open" = open

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** retrieves the status of the print head.

```
! U1 getvar "head.latch"
```

```
"ok"
```

## input.capture

This parameter allows capturing input data in diagnostics mode. Input capture has three modes: "print", "run", and "off". The "print" and "run" modes can be used to examine data received by the printer.

When in "print" mode the printer will save incoming data to files named "**in??? .dmp**", where ??? is a number between 001 to 999. The printer will then print the text and hexadecimal representation of data bytes received instead of printing the formatted labels which that data might represent. When in "run" mode the printer will save captured incoming data to files as above, but will otherwise run the incoming data/commands normally.

The capture files should be deleted from printer memory after retrieving them. Leaving the printer in "print" or "run" mode and not deleting the capture files will reduce the printer's available flash memory.

The "off" mode is the printer's normal operating mode. Cycling power will also return the printer to "off" mode.

**Note** • This command does not capture a network packet trace.

Commands	Details
<b>setvar</b>	<p>This command sets the directory name from which to retrieve files.  <b>Format:</b> ! U1 setvar "input.capture" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"print"</li> <li>"run"</li> <li>"off"</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command retrieves the current <b>input.capture</b> setting value.  <b>Format:</b> ! U1 getvar "input.capture"</p>

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.arp\_interval

This command changes the arp interval.

Commands	Details
<b>setvar</b>	This command retrieves the gateway address of the active print server. <b>Format:</b> <b>! U1 getvar "interface.network.active.arp_interval" "value"</b> <b>Values:</b> integer values from "0" to "30" <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the current arp interval setting, shown in minutes. <b>Format:</b> <b>! U1 getvar "interface.network.active.arp_interval"</b>

**Example:** In this example, the **setvar** changes the arp interval to three minutes.

```
! U1 getvar "interface.network.active.arp_interval" "3"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.cable\_type

This command returns the cable type of the active network, either 10/100BaseT, Wireless 802.11b/g, or Wireless 802.11n.

**Note •** This command will only give a valid response once an IP address has been established.

Commands	Details
<b>getvar</b>	<p>This command retrieves the current cable type of the active network.</p> <p><b>Format:</b> ! U1 getvar "interface.network.active.cable_type"</p> <p><b>Values:</b></p> <p>"10/100BaseT" "Wireless 802.11b/g" "Wireless 802.11n"</p> <p><b>Default:</b> NA</p>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.dhcp\_received\_host\_name

This command reports the Host Name as assigned by the DHCP Server. If one is not assigned, or DHCP is not used, then the field will be blank.

**Note** • This command will only give a valid response once an IP address has been established.

Commands	Details
getvar	This command reports the host name.. <b>Format:</b> ! U1 getvar "interface.network.active.dhcp_received_host_name"

**Example:**

```
! U1 getvar "interface.network.active.dhcp_received_host_name"
```

**Result:**

```
"Zebra Printer on shelf 2112"
```

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.gateway

This command retrieves the gateway address of the active print server. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the gateway address of the active print server. <b>Format:</b> <b>! U1 getvar "interface.network.active.gateway"</b>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** retrieves the gateway address of the active print server.

```
! U1 getvar "interface.network.active.gateway"
```

```
"10.3.5.1"
```

## interface.network.active.ip\_addr

This command retrieves the IP address of the active print server. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the IP address of the active print server. <b>Format:</b> <b>! U1 getvar "interface.network.active.ip_addr"</b>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** retrieves the IP address of the active print server.

```
! U1 getvar "interface.network.active.ip_addr"
```

```
"10.3.5.92"
```

## interface.network.active.mac\_addr

This command retrieves the MAC address of the active print server. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the MAC address of the active print server. <b>Format:</b> <b>! U1 getvar "interface.network.active.mac_addr"</b>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** retrieves the MAC address of the active print server.

```
! U1 getvar "interface.network.active.mac_addr"
```

```
"00:07:4d:24:08:ff"
```

## interface.network.active.mac\_raw

This command identifies the RAW MAC address of the active print server. The raw mac address is the mac address without the colons (""). For printer support, see [SGD Command Support](#) on page 1365.

Commands	Details
<b>getvar</b>	This command retrieves the RAW MAC address of the active print server. <b>Format:</b> <b>! U1 getvar "interface.network.active.mac_raw"</b>

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

**Example:** In this example, the **getvar** retrieves the RAW MAC address of the active print server.

```
! U1 getvar "interface.network.active.mac_raw"
```

```
"00074d2408ff"
```

## interface.network.active.netmask

This command retrieves the netmask of the active print server. For printer support, see [SGD Command Support](#) on page 1365.

Commands	Details
<b>getvar</b>	This command retrieves the netmask of the active print server. <b>Format:</b> <b>! U1 getvar "interface.network.active.netmask"</b>

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

**Example:** In this example, the **getvar** retrieves the netmask of the active print server.

```
! U1 getvar "interface.network.active.netmask"
```

```
"255.255.255.0"
```

## interface.network.active.protocol

**Description** This command retrieves IP protocol of the active print server. For printer support, see [SGD Command Support on page 1365](#).

**Type** getvar

Commands	Details
getvar	This command retrieves the IP protocol of the active print server. <b>Format:</b> <code>! U1 getvar "interface.network.active.protocol"</code>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## interface.network.active.protocol\_error

This command returns the last error reported by the active print server.

Commands	Details
<b>getvar</b>	This command returns the last error reported by the active print server. <b>Format:</b> ! U1 getvar "interface.network.active.protocol_error"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.rx\_errors

This command returns the current number of packet receive errors on the active network interface.

Commands	Details
<b>getvar</b>	This command returns the current number of packet receive errors. <b>Format:</b> ! U1 getvar "interface.network.active.rx_errors" <b>Result:</b> The current number of errors.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.rx\_packets

This command returns the number of packets received on the active network interface since the last power cycle.

Commands	Details
<b>getvar</b>	This command returns the number of packets received on the active network interface since the last power cycle. <b>Format:</b> ! U1 getvar "interface.network.active.rx_packets" <b>Result:</b> An integer.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.server\_address

This command returns the network IP address of the server that provided the printer's IP address.

Commands	Details
<b>getvar</b>	<p>This command returns the network IP address of the server providing the printer's IP address.</p> <p><b>Format:</b> ! U1 getvar "interface.network.server_address"</p> <p><b>Result:</b> an IP address</p>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.protocol\_error

This command returns the last error reported by the print server.

Commands	Details
<b>getvar</b>	<p>This command returns the last error reported by the print server. <b>Format:</b> ! U1 getvar "interface.network.active.protocol_error" <b>Result:</b> WINS Name in Conflict</p>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.speed

This command returns the speed in megabits per second of the active print server network since the last power cycle.

Commands	Details
<b>getvar</b>	This command returns the active print server network speed since the last power cycle. <b>Format:</b> ! U1 getvar "interface.network.active.speed" <b>Result:</b> A number indicating megabits/second

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.tx\_errors

This command returns the number of packet transmit errors on the active print server network since the last power cycle.

Commands	Details
<b>getvar</b>	This command returns the number of packet transmit errors on the active print server network since the last power cycle. <b>Format:</b> ! U1 getvar "interface.network.active.tx_errors" <b>Result:</b> An integer number

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.tx\_packets

This command returns the number of packets transmitted on the active print server network since the last power cycle.

Commands	Details
<b>getvar</b>	<p>This command returns the number of packets transmitted on the active print server network since the last power cycle.</p> <p><b>Format:</b> ! U1 getvar "interface.network.active.tx_packets"</p> <p><b>Result:</b> A number.</p>

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.active.wins\_addr

This command sets and retrieves the active WINS address.

Commands	Details
<b>setvar</b>	This command sets the WINS address of the active print server. <b>Format:</b> ! U1 setvar "interface.network.active.wins_addr" "value" <b>Values:</b> "0.0.0.0" - "255.255.255.255"
<b>getvar</b>	This command retrieves the WINS address of the active print server. <b>Format:</b> ! U1 getvar "interface.network.active.wins_addr" <b>Result:</b> a WINS address

→ **Example:** In this example, the **setvar** sets the Wins address of the active print server.  
! U1 setvar "interface.network.active.wins.addr" "10.3.5.120"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## interface.network.settings\_require\_reset

Displays whether or not the network system has to be reset for a new configuration setting to take effect.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "interface.network.settings_require_reset" <b>Values:</b> "no" = no settings have been changed that require a reset to take effect. "yes" = one or more settings has been changed that requires a reset to take effect.

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## log.reboot.code

Causes the printer to return a one-character value which indicates the reason for the last printer reboot.

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "log.reboot.code"</p> <p><b>Result:</b> A one-character code indicating the reason for the reboot.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"0" - Other</li><li>"1" - device.reset command</li><li>"2" - Mirror reset – new files</li><li>"3" - DTR off</li><li>"4" - Low-battery timeout</li><li>"5" - Low-battery shutdown</li><li>"6" - power.shutdown command</li><li>"7" - Idle timeout</li><li>"8" - Printer OS update</li><li>"9" - Reserved</li><li>"a" - Reserved</li><li>"b" - Off key</li><li>"f" - No data</li></ul>

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Example:

```
! U1 getvar "log.reboot.code"
```

### Result: 4

The result indicates that the device rebooted because the battery timed out.

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## log.reboot.codes

Causes the printer to return a list of one-character values which indicates the reasons for the last 32 printer reboots.

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "log.reboot.codes"</p> <p><b>Result:</b> A string of one-character codes indicating the reason for the reboots. A total of 32 reboot events are stored; if less than 32 reboots have occurred, "f" is stored in any unpopulated event slot, indicating "no data" for that event.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"0" - Other</li> <li>"1" - device.reset command</li> <li>"2" - Mirror reset – new files</li> <li>"3" - DTR off</li> <li>"4" - Low-battery timeout</li> <li>"5" - Low-battery shutdown</li> <li>"6" - power.shutdown command</li> <li>"7" - Idle timeout</li> <li>"8" - Printer OS update</li> <li>"9" - Reserved</li> <li>"a" - Reserved</li> <li>"b" - Off key</li> <li>"f" - No data</li> </ul>

### Example:

```
! U1 getvar "log.reboot.codes"
```

**Result:** "bb338bbbbbbb3bbbbbbbbb1bb"

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## log.reboot.reason

Returns the reason for the last printer reboot, based on the **log.reboot.code**.

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "log.reboot.reason"</p> <p><b>Result:</b> The reason for the last reboot.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"Other"</li> <li>"device.reset command"</li> <li>"Mirror reset - new files"</li> <li>"DTR off"</li> <li>"Low-battery timeout"</li> <li>"Low-battery shutdown"</li> <li>"power.shutdown command"</li> <li>"Idle timeout"</li> <li>"New OS reprogramming"</li> <li>"Unknown-1"</li> <li>"Unknown-2"</li> <li>"Off key"</li> <li>"No data"</li> </ul>

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## log.reboot.report

Causes the printer to return a list of values which indicate the reasons for the last 32 printer reboots.

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "log.reboot.report"</p> <p><b>Result:</b> The recorded reboot reasons as a list, starting with the most recent reboot reason first. A total of 32 reboot events are stored; if less than 32 reboots have occurred, "f" is stored in any unpopulated event slot, indicating "no data" for that event.</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"Other"</li> <li>"device.reset command"</li> <li>"Mirror reset - new files"</li> <li>"DTR off"</li> <li>"Low-battery timeout"</li> <li>"Low-battery shutdown"</li> <li>"power.shutdown command"</li> <li>"Idle timeout"</li> <li>"New OS reprogramming"</li> <li>"Unknown-1"</li> <li>"Unknown-2"</li> <li>"Off key"</li> <li>"No data"</li> </ul>

**Example:** ! U1 getvar "log.reboot.report"

**Result:** A list of 32 codes, in a carriage-return delimited list:

```
"Off key
Off key
Off key
.
.
.
No data
"
```

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## mcr.crypt.enabled

Retrieves the MCR encryption-enabled status.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "mcr.crypt.enabled" <b>Values:</b> "off" = mcr encryption is not enabled "on" = mcr encryption is enabled

### Supported Devices

- ZQ510
- ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## mcr.cancel

Cancels the magnetic card read operation currently in progress.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "mcr.cancel" "" <b>Values:</b> No value needs to be specified. <b>Default:</b> NA

### Supported Devices

- ZQ510
- ZQ520

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## mcr.crypt.key\_mgmt

Retrieves the MCR encryption key management algorithm for a fixed key or DUKPT (Derived Unique Key Per Transaction). The return value applies only if "mcr.crypt.enabled" is "on".

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "mcr.crypt.key_mgmt"</p> <p><b>Values:</b></p> <p>"" = fixed key algorithm "dukpt" = derived unique key per transaction</p> <p><b>Default:</b> N/A</p>

### Supported Devices

- ZQ510
- ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## mcr.crypt.algorithm

Retrieves the MCR encryption algorithm. The return value applies only if "mcr.crypt.enabled" is "on".

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "mcr.crypt.algorithm"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>""</li><li>"3des"</li><li>"aes"</li></ul> <p><b>Default:</b> N/A</p>

### Supported Devices

- ZQ510
- ZQ520

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## mcr.out

Specifies the communication port which MCR (Mag Card Reader) output is sent to.

Commands	Details
setvar	<p><b>Format:</b> ! U1 setvar "mcr.out" "value"</p> <p><b>Values:</b></p> <p>"active" = the data is sent out over the same port that the command was received on.</p> <p><b>Note</b> • If "multiple" is specified in the option string of the <b>mcr.enable</b> command, data will continue to be sent to the port defined by this command.</p> <p>"alert" = the data will be forwarded as a weblink alert.</p> <p><b>Default:</b> "active"</p>

### Supported Devices

- ZQ510
- ZQ520

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## mcr.revision

Returns the revision of the MCR (magnetic card reader).

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "mcr.revision" <b>Result:</b> "ID TECH TM3 SecureHead RS232 Reader V 5.14"

### Supported Devices

- ZQ510, ZQ520

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## media.cartridge.part\_number

This printer command retrieves the part number of the media cartridge used in the printer.

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the media cartridge part number currently being used by the printer. <b>Format:</b> ! U1 getvar "media.cartridge.part_number"

### Supported Devices

- HC100

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the getvar returns the part number of the media cartridge.

```
! U1 getvar "media.cartridge.part_number" "10006999"
```

## media.cut\_now

This command instructs the printer cycle the media cutter. If the printer is in Print Mode Kiosk (media.printmode "K") then the cutter will execute a cut based on the value of media.present.cut\_amount – either a normal cut or a partial cut. If the printer is not in Print Mode Kiosk (media.printmode "K"), this command does nothing. See [media.present.cut\\_amount on page 813](#).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to cycle the media cutter.</p> <p><b>Format:</b> ! U1 setvar "media.cut_now" ""</p> <p> <b>Note</b> • See <a href="#">media.present.cut_amount on page 813</a>.</p>
<b>do</b>	<p>This command instructs the printer to cycle the media cutter.</p> <p><b>Format:</b> ! U1 do "media.cut_now" ""</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.darkness\_mode

This command instructs the printer to set the darkness mode. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command instructs the printer to set the darkness mode.</p> <p><b>Format:</b></p> <pre>! U1 setvar "media.darkness_mode" "value"</pre> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"<b>cartridge</b>" = cartridge mode (no changes allowed)</li><li>"<b>user</b>" = user mode (Darkness is set by the user, and the cartridge value is ignored. This value is used for all cartridges inserted in the printer).</li><li>"<b>relative</b>" = relative mode (the specified darkness value is added to the cartridge default value)</li></ul> <p><b>Default:</b> "<b>cartridge</b>"</p>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the darkness mode set to "**cartridge**".

```
! U1 setvar "media.darkness_mode" "cartridge"
```

## media.draft\_mode

This command puts the printer into draft mode setting.

**Note •** Setting the printer to draft mode may result in poorer print quality depending on print speed, label configurations, etc.

Commands	Details
<b>setvar</b>	<p>This command sets the value. <b>Format:</b> ! U1 setvar "media.draft_mode" "value" <b>Values:</b> enabled = faster ramp (acceleration) speed disabled = normal ramp (acceleration) speed <b>Default:</b> disabled</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the currently set value. <b>Format:</b> ! U1 getvar "media.draft_mode"</p>

**Supported Devices** ZE500-4

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## media.feed\_skip

This command only applies to labels created with CPCL commands. It controls the same setting as the second parameter of the CPCL SETFF command.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "media.feed_skip" "value" <b>Values:</b> a numeric value from 0 to 50. <b>Default:</b> 5 - for QLn and ZQ series printers 35 - for iMZ and ZR series printers
<b>getvar</b>	<b>Format:</b> ! U1 getvar "media.feed_skip" <b>Result:</b> a numeric value from 0 to 50.

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## media.media\_low.external

This printer setting gets the status of the external media\_low warning. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
getvar	<p>This command instructs the printer to respond with the currently set media print mode.</p> <p><b>Format:</b></p> <pre>! U1 getvar "media.media_low.external"</pre> <p><b>Values:</b></p> <p>0 = Paper present at sensor position 1 = No paper present</p> <p> <b>Note</b> • The status of the sensor is sampled every time the printout is cut. If three succeeding samples show "no paper", the status reply changes to 1. This is to prevent a false alarm if the side of the paper roll is not clean. If the current status of the sensor is required, use ~HQES and extract the paper near-end sensor bit.</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.media\_low.warning

This command retrieves the value of, or enables or disables the Supplies Warning system. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command enables or disables the Supplies Warning System. <b>Format:</b> ! U1 setvar "media.media_low.warning" "value" <b>Values:</b> "disabled" = not active "enabled" = active <b>Default:</b> "disabled"
<b>getvar</b>	This command retrieves the setting for the Supplies Warning system. <b>Format:</b> ! U1 getvar "media.media_low.warning"

### Supported Devices

- Xi4
- RXi4

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example 1:** This **setvar** example disables the Supplies Warning system.

```
! U1 setvar "media.media_low.warning" "disabled"
```

**Example 2:** This **setvar** example enables the Supplies Warning system.

```
! U1 setvar "media.media_low.warning" "enabled"
```

## media.present.cut\_amount

This printer setting determines the type of cut made by the printer cutter (normal or partial) and, if partial, the length of the partial cut on each side, in mm. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details				
<b>setvar</b>	<p>This command instructs the printer to change the media cut amount.</p> <p><b>Format:</b></p> <pre>! U1 setvar "media.present.cut_amount" "value"</pre> <p><b>Values:</b></p> <table><tr><td>0</td><td>= normal cut</td></tr><tr><td>10–60</td><td>= partial cut, value = mm of media left uncut</td></tr></table>	0	= normal cut	10–60	= partial cut, value = mm of media left uncut
0	= normal cut				
10–60	= partial cut, value = mm of media left uncut				
<b>getvar</b>	<p>This command instructs the printer to respond with the currently set media cut amount.</p> <p><b>Format:</b></p> <pre>! U1 getvar "media.present.cut_amount"</pre>				

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.present.eject

This command instructs the printer to eject the document through the presenter module. The value is the amount to eject, in mm. The value of [media.present.length\\_addition](#) gets added to the value to determine the total length of media ejected. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command instructs the printer to eject the document through the presenter module.</p> <p><b>Format:</b> ! U1 setvar "media.present.eject" "value"</p> <p><b>Values:</b></p> <p>0 – 255 = amount of media to eject in mm</p> <p> <b>Note</b> • See <a href="#">media.present.length_addition on page 815</a>.</p>
do	<p>This command instructs the printer to eject the document through the presenter module.</p> <p><b>Format:</b> ! U1 do "media.present.eject" "value"</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.present.length\_addition

This printer setting adds an additional amount to how far the paper is ejected during a present cycle. A standard amount of 50mm is always added to clear the kiosk wall. This amount is added to that 50mm. The total amount of media ejected this command is executed, then, is 50mm + media.present.length\_addition + media.present.eject. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command instructs the printer to change the media present length addition.</p> <p><b>Format:</b> ! U1 setvar "media.present.length_addition" "value"</p> <p><b>Values:</b></p> <p>0-255 = additional mm of media to eject</p>
getvar	<p>This command instructs the printer to respond with the currently set media present length addition.</p> <p><b>Format:</b> ! U1 getvar "media.present.length_addition"</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.present.loop\_length

This printer setting determines the length of the presenter loop. If loop\_length is greater than loop\_length\_max (see media.present.loop\_length\_max) then it will be set equal to loop\_length\_max. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command instructs the printer to change the presenter loop length.</p> <p><b>Format:</b></p> <pre>! U1 setvar "media.present.loop_length" "value"</pre> <p><b>Values:</b></p> <p>0 = paper is fed straight through the presenter 3-1023 = loop length in mm.</p> <p><b>Default:</b></p> <p>400 = gives a loop of approximately 400mm</p>
getvar	<p>This command instructs the printer to respond with the currently set presenter loop length.</p> <p><b>Format:</b> ! U1 getvar "media.present.loop_length"</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.present.loop\_length\_max

This printer setting determines the maximum allowed length of the presenter loop. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the presenter loop length.</p> <p><b>Format:</b></p> <pre>! U1 setvar "media.present.loop_length_max" "value"</pre> <p><b>Values:</b></p> <p>0 = paper is fed straight through the presenter 3-1023 = loop length in mm.</p> <p><b>Default:</b></p> <p>400 = gives a loop of approximately 400mm</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the currently set presenter loop length.</p> <p><b>Format:</b></p> <pre>! U1 getvar "media.present.loop_length_max"</pre>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.present.cut\_margin

This printer setting determines the margin between the cutter and the printhead. For printer support, see [SGD Command Support](#) on page 1365.

Commands	Details
setvar	<p>This command instructs the printer to change the media cut amount.</p> <p><b>Format:</b> ! U1 setvar "media.present.cut_margin" "value"</p> <p><b>Values:</b> 2 – 9 = mm of distance</p> <p><b>Default:</b> 9 = mm of distance</p>
getvar	<p>This command instructs the printer to respond with the currently set media cut margin amount.</p> <p><b>Format:</b> ! U1 getvar "media.present.cut_margin"</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

## media.present.present\_timeout

This printer setting determines how long the printer will wait after a present event to clear the label. See `^KV` ZPL command. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command instructs the printer to change the presenter function mode.</p> <p><b>Format:</b> <code>! U1 setvar "media.present.present_timeout" "value"</code></p> <p><b>Values:</b></p> <p>0 – 300 = If label is not taken, retract label when timeout expires. Timeout is in seconds. Zero (0) indicates that there is no timeout. The label will stay presented until removed manually or a new label is printed.</p>
getvar	<p>This command instructs the printer to respond with the currently set presenter function mode.</p> <p><b>Format:</b> <code>! U1 getvar "media.present.present_timeout"</code></p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.present.present\_type

This printer setting determines the way that the printer performs a present command. See ^KV ZPL command. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
setvar	<p>This command instructs the printer to change the presenter function mode.</p> <p><b>Format:</b> ! U1 setvar "media.present.present_type" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>0 = Eject page when new page is printed</li><li>1 = Retract page when new page is printed</li><li>2 = Do nothing when new page is printed</li></ul>
getvar	<p>This command instructs the printer to respond with the currently set presenter function mode.</p> <p><b>Format:</b> ! U1 getvar "media.present.present_type"</p>

### Supported Devices

- KR403

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## media.printmode

This printer setting determines the action the printer takes after a label or group of labels has printed. For printer support, see [SGD Command Support on page 1365](#). This command is equivalent to [^MM on page 297](#).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the media print mode.</p> <p><b>Format:</b> ! U1 setvar "media.printmode" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"T" = Tear-off <sup>al</sup></li> <li>"P" = Peel-off (not available on S-300) <sup>al, am</sup></li> <li>"R" = Rewind (depends on printer model)</li> <li>"A" = Applicator (depends on printer model) <sup>al</sup></li> <li>"C" = Cutter (depends on printer model) <sup>am</sup></li> <li>"D" = Delayed cutter <sup>al, am</sup></li> <li>"F" = RFID <sup>al, am</sup></li> <li>"L" = Linerless Peel <sup>am, an</sup></li> <li>"U" = Linerless Rewind <sup>am, an</sup></li> <li>"K" = Kiosk <sup>ao</sup></li> <li>"V" = Linerless Tear <sup>am</sup></li> <li>"S" = Stream <sup>am</sup></li> </ul>
<b>getvar</b>	<p>This command instructs the printer to respond with the currently set media print mode.</p> <p><b>Format:</b> ! U1 getvar "media.printmode"</p>

**al.** This value is not supported on the KR403 printer.

**am.** This value is not supported on the ZE500 printer.

**an.** This value is supported only on the ZM400/ZM600 and RZ400/RZ600 printers.

**ao.** This value is supported only on the KR403 printer.

**ap.** This value is supported only on the ZE500 printer.

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "T".

```
! U1 setvar "media.printmode" "T"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "tear off".

For more details on how each **setvar** value relates to the **getvar** responses, see [Table 26, Setvar / Getvar Relation on page 822](#).

Table 26 • Setvar / Getvar Relation

If the setvar is set to ...	Then the getvar response and control panel display is ...
"T"	TEAR OFF
"P"	PEEL OFF
"R"	REWIND
"A"	APPLICATOR
"C"	CUTTER
"D"	DELAYED CUT
"L"	RESERVED
"U"	RESERVED
"K"	KIOSK

## media.speed

This command specifies media print speed in inches per second (ips). For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the media print speed.</p> <p><b>Format:</b> ! U1 setvar "media.speed" "value"</p> <p><b>Values:</b></p> <p>2-12 ips</p> <p>"up" = increments the printer speed by one unit</p> <p>"down" = decrements the speed by one unit</p> <p><b>Default:</b> "2"</p>
<b>getvar</b>	<p>This command retrieves the currently set media print speed.</p> <p><b>Format:</b> ! U1 getvar "media.speed"</p>

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example 1:** This **setvar** example shows the value set to "2".

**! U1 setvar "media.speed" "2"**

When the **setvar** value is set to "2", the **getvar** result is "2".

**Example 2:** This **setvar** example shows the value set to "up".

**! U1 setvar "media.speed" "up"**

If the current print speed is 2: When the **setvar** value is set to "up", the **getvar** result is "3".

**Example 3:** This **setvar** example shows the value set to "down".

**! U1 setvar "media.speed" "down"**

If the current print speed is 2: When the **setvar** value is set to "down", the **getvar** result is "1".

## memory.flash\_free

This parameter returns the amount of available Flash memory. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
getvar	Format: ! U1 getvar "memory.flash_free"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## memory.flash\_size

This parameter returns the total amount of Flash memory. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
getvar	Format: ! U1 getvar "memory.flash_size"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## memory.ram\_free

This parameter returns the amount available Random Access Memory (RAM). For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
getvar	Format: ! U1 getvar "memory.ram_free"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

## memory.ram\_size

This parameter returns the total amount of Random Access Memory (RAM).

Commands	Details
getvar	Format: ! U1 getvar "memory.ram_size"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.agent\_addr

This parameter obtains or changes the Network Management agent IP address.

Commands	Details
<b>setvar</b>	This command sets the Network Management Agent IP address . <b>Format:</b> ! U1 setvar "netmanage.avalanche.agent_addr" "value" <b>Values:</b> any valid IP address <b>Default:</b> "0.0.0.0"
<b>getvar</b>	This command retrieves the current Network Management IP address. <b>Format:</b> ! U1 getvar "netmanage.avalanche.agent_addr"

### Example:

```
! U1 setvar "netmanage.avalanche.agent_addr" "10.14.2.200"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.available\_agent

This command returns the current IP address of the remote agent found during the Agent Discovery Phase.

Commands	Details
getvar	<p>This command obtains the IP address of the remote agent found during the Agent Discovery Phase.</p> <p><b>Format:</b> ! U1 getvar "netmanage.avalanche.available_agent"</p> <p><b>Result:</b> An IP address</p>

### Example:

```
! U1 getvar "netmanage.avalanche.available_agent"
```

### Result:

```
"10.3.4.128"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.available\_port

This command returns the available port of the remote agent found during the Agent Discovery Phase.

Commands	Details
<b>setvar</b>	This command sets the available port of the remote agent found during the Agent Discovery Phase. <b>Format:</b> <code>! U1 setvar "netmanage.avalanche.available_port" "value"</code> <b>Values:</b> "0" to "65535" <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the current port setting of the remote agent found during the Agent Discovery Phase. <b>Format:</b> <code>! U1 getvar "netmanage.avalanche.available_port"</code>

### Example:

```
U1 setvar "netmanage.avalanche.available_port" "1800"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.encryption\_type

This parameter sets and gets the Network Management Encryption type to be used.

Commands	Details
<b>setvar</b>	<p>This command sets the Network Management Encryption type to be used.</p> <p><b>Format:</b> <code>! U1 setvar "netmanage.avalanche.encryption_type" "value"</code></p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li><code>"0"</code> = None</li><li><code>"1"</code> = Limburger</li><li><code>"2"</code> = AES128S</li></ul> <p><b>Default:</b> <code>"0"</code></p>
<b>getvar</b>	<p>This command retrieves the currently set Network Management Encryption type.</p> <p><b>Format:</b> <code>! U1 getvar "netmanage.avalanche.encryption_type"</code></p>

**Example:** This example sets the value to Limburger (1) encryption type.

```
! U1 getvar "netmanage.avalanche.encryption_type" "1"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.interval

This parameter obtains or sets the Network Management Update Interval time stored in the printer. Time is measured in milliseconds (e.g., a setting of "2000" equals 2 seconds).

Commands	Details
<b>setvar</b>	This command sets the Network Management Update Interval. <b>Format:</b> ! U1 setvar "netmanage.avalanche.interval" "value" <b>Values:</b> any integer value from "0" to "4294967295" ( <i>4,294,967,295 milliseconds</i> ) <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the current Network Management Update Interval. <b>Format:</b> ! U1 getvar "netmanage.avalanche.interval"

**Example:** This example sets the interval value to 3 seconds.

```
! U1 setvar "netmanage.avalanche.interval" "3000"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.interval\_update

This parameter turns on or off the Network Management Update Interval. This command is related to [netmanage.avalanche.interval](#) on page 832.

Commands	Details
<b>setvar</b>	This command turns on or off the network management interval update. <b>Format:</b> ! U1 setvar "netmanage.avalanche.interval_update" "value" <b>Values:</b> "off" "on" <b>Default:</b> "off"
<b>getvar</b>	This command retrieves the current network management interval update setting. <b>Format:</b> ! U1 getvar "netmanage.avalanche.interval_update"

**Example:** This example sets the device's Network Management Interval Update setting to "on".

```
! U1 setvar "netmanage.avalanche.interval_update" "on"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.model\_name

This command obtains or sets the current Network Management Device Model Name stored in the printer.

Commands	Details
<b>setvar</b>	This command sets the current Network Management Device model name. <b>Format:</b> ! U1 setvar "netmanage.avalanche.model_name" "value" <b>Values:</b> a string up to 31 characters in length. <b>Default:</b> NA
<b>getvar</b>	This command retrieves the current Network Management Device model name. <b>Format:</b> ! U1 getvar "netmanage.avalanche.model_name"

### Example:

```
! U1 setvar "netmanage.avalanche.model_name" "ZT230"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.set\_property

This parameter sets Network Management Device Side Property (custom).

Commands	Details
<b>setvar</b>	This parameter sets Network Management Device Side Property (custom). <b>Format:</b> ! U1 setvar "netmanage.avalanche.set_property" "value" <b>Values:</b> A string in the format of "AAAA=XXXXXXXX"
<b>getvar</b>	This parameter retrieves the current Network Management Device Side Property value. <b>Format:</b> ! U1 getvar "netmanage.avalanche.set_property"

→ **Example 1:** This example will be viewed as a property under the general properety tree in avalanche console.

```
! U1 setvar netmanage.avalanche.set_property" "ZebraLocation=VH"
```

→ **Example 2:** This example will be viewed as a property under the Zebra tree in avalanche console.

```
! U1 setvar netmanage.avalanche.set_property" "Zebra.Location=VH"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.startup\_update

This parameter sets and retrieves the Network Management Start Up Update setting.

Commands	Details
<b>setvar</b>	This command sets the device's Network Management Start Up Update setting. <b>Format:</b> <code>! U1 setvar "netmanage.avalanche.startup_update" "value"</code> <b>Values:</b> <code>"off"</code> <code>"on"</code> <b>Default:</b> <code>"off"</code>
<b>getvar</b>	This command retrieves the device's current Network Management Start Up Update setting. <b>Format:</b> <code>! U1 getvar "netmanage.avalanche.startup_update"</code>

### Example:

```
! U1 setvar "netmanage.avalanche.startup_update" "on"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.tcp\_connection\_timeout

This command sets the Network Management Timeout used for establishing a TCP connection to an Agent. Time is set in milliseconds.

Commands	Details
<b>setvar</b>	This command sets the Network Management Timeout used for establishing a TCP connection to an Agent. <b>Format:</b> <code>! U1 setvar "netmanage.avalanche.tcp_connection_timeout" "value"</code> <b>Values:</b> any integer value from " <b>0</b> " to " <b>4294967295</b> " ( <i>4,294,967,295 milliseconds</i> ) <b>Default:</b> " <b>0</b> "
<b>getvar</b>	This command retrieves the current Network Management Timeout used for establishing a TCP connection to an Agent. <b>Format:</b> <code>! U1 getvar "netmanage.avalanche.tcp_connection_timeout"</code>

**Example:** This examples sets the connection timeout to 2000 milliseconds (2 seconds).

```
! U1 setvar "netmanage.avalanche.tcp_connection_timeout" "2000"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.terminal\_id

Sets or retrieves the Terminal ID of the Avalanche server. This value is typically assigned by the Avalanche server.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "netmanage.avalanche.terminal_id" "value" <b>Values:</b> "0" – "402653183" <b>Default:</b> "0"
getvar	<b>Format:</b> ! U1 getvar "netmanage.avalanche.terminal_id"

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.text\_msg.beep

This parameter sets and gets Network Management Text Message Beep enable setting.

Commands	Details
<b>setvar</b>	This command sets Network Management Text Message Beep enable setting. <b>Format:</b> ! U1 setvar "netmanage.avalanche.text_msg.beep" "value" <b>Values:</b> "off" "on" <b>Default:</b> "off"
<b>getvar</b>	This command retrieves the Network Management Text Message Beep enable setting. <b>Format:</b> ! U1 getvar "netmanage.avalanche.text_msg.beep"

### Example:

```
! U1 setvar "netmanage.avalanche.text_msg.beep" "on"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.text\_msg.display

This command turns on and off the Network Management Text Message Display setting.

Commands	Details
<b>setvar</b>	This command retrieves the device's Network Management Text Message Display enable setting. <b>Format:</b> <code>! U1 setvar "netmanage.avalanche.text_msg.display" "value"</code> <b>Values:</b> "off" "on" <b>Default:</b> "off"
<b>getvar</b>	This command returns the current Network Management Text Message Display enable setting. <b>Format:</b> <code>! U1 getvar "netmanage.avalanche.text_msg.display"</code>

### Example:

```
! U1 setvar "netmanage.avalanche.text_msg.display" "on"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.text\_msg.print

This command turns on and off the Network Management Text Message Print setting.

Commands	Details
<b>setvar</b>	<p>This command retrieves the device's Network Management Text Message Print enable setting.</p> <p><b>Format:</b> <code>! U1 setvar "netmanage.avalanche.text_msg.print" "value"</code></p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"off"</li><li>"on"</li></ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command returns the current Network Management Text Message Print enable setting.</p> <p><b>Format:</b> <code>! U1 getvar "netmanage.avalanche.text_msg.print"</code></p>

### Example:

```
! U1 setvar "netmanage.avalanche.text_msg.print" "on"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.avalanche.udp\_timeout

This command sets the device's Network Management UDP timeout. Time is set in milliseconds.

Commands	Details
<b>setvar</b>	This command sets the device's Network Management UDP timeout. <b>Format:</b> <code>! U1 setvar "netmanage.avalanche.udp_timeout" "value"</code> <b>Values:</b> any integer value from " <b>0</b> " to " <b>4294967295</b> " ( <i>4,294,967,295 milliseconds</i> ) <b>Default:</b> " <b>0</b> "
<b>getvar</b>	This command returns the current Network Management UDP timeout setting. <b>Format:</b> <code>! U1 getvar "netmanage.avalanche.udp_timeout"</code>

**Example:** This example sets the timeout value to .4 seconds (400 milliseconds).

```
! U1 setvar "netmanage.avalanche.udp_timeout" "400"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.error\_code

This parameter refers to Avalanche client error code.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "netmanage.error_code" <b>Result:</b> "0"

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.state\_code

This parameter refers to Avalanche client state code.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "netmanage.state_code" <b>Result:</b> "0"

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## netmanage.status\_code

This parameter refers to Avalanche client status code.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "netmanage.status_code" <b>Result:</b> "0"

### Supported Devices

- iMZ220, iMZ320
- QLn320, QLn220
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.cut\_marker\_count

Returns the number of cuts incurred by the cutter or resets the counter to "0". This command tracks the same events as [odometer.total\\_cuts](#), which cannot be reset.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "odometer.cut_marker_count" "value" <b>Values:</b> "0" - resets the counter to 0.
<b>getvar</b>	<b>Format:</b> ! U1 getvar "odometer.cut_marker_count" <b>Result:</b> an integer value of "0" or greater.

### Supported Devices

- ZD410, ZD420
- ZD500
- ZT210, ZT220, ZT230
- ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.headclean

This printer setting refers to the head clean odometer count. This counter tracks how many inches and centimeters have passed through the printer since the head was last cleaned.

Commands	Details
<b>setvar</b>	This command instructs the printer to reset the head clean counter. <b>Format:</b> ! U1 setvar "odometer.headclean" "value" <b>Values:</b> "0" = reset the head clean counter <b>Default:</b> must be an accepted value or it is ignored
<b>getvar</b>	This command instructs the printer to retrieve the values for the head clean counter. <b>Format:</b> ! U1 getvar "odometer.headclean"

**Example:** This example shows how to get the odometer head clean, how to reset it, and how to confirm the settings changed.

1. To see the current settings, type:  
! U1 getvar "odometer.headclean"  
Something similar to this is shown:  
"1489 INCHES, 3784 CENTIMETERS"
2. To reset these values to 0, type:  
! U1 setvar "odometer.headclean" "0"
3. To confirm these settings were reset, type:  
! U1 getvar "odometer.headclean"  
If the resetting was successful, this is shown:  
"0 INCHES, 0 CENTIMETERS"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.headnew

This printer setting refers to the head replaced odometer count. This counter tracks how many inches and centimeter passed through the printer since the head was last replaced.

Commands	Details
<b>setvar</b>	This command instructs the printer to reset the head new counter. <b>Format:</b> ! U1 setvar "odometer.headnew" "value" <b>Values:</b> "0" = resets the head new counter <b>Default:</b> must be an accepted value or it is ignored
<b>getvar</b>	This command instructs the printer to retrieve the values for the head new counter. <b>Format:</b> ! U1 getvar "odometer.headnew"

**Example:** This example shows how to get the odometer head new, how to reset it, and how to confirm the settings changed:

1. To see the current settings, type:  
! U1 getvar "odometer.headnew"  
Something similar to this is shown:  
"1489 INCHES, 3784 CENTIMETERS"
2. To reset the these values to 0, type:  
! U1 setvar "odometer.headnew" "0"
3. To confirm this settings were reset, type:  
! U1 getvar "odometer.headnew"  
If the resetting was successful, this is shown:  
"0 INCHES, 0 CENTIMETERS"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.label\_dot\_length

This command returns the length of the last label printed or fed (in dots).

Commands	Details
getvar	<p>This command returns the length of the last label printed or fed (in dots). <b>Format:</b> <code>! U1 getvar "odometer.label_dot_length"</code></p>

**Example:** This is an example of how to reset the length using the `^LL` command and how to use the getvar to confirm the change. For the `^LL` command to work the printer must be in continuous mode.

1. To change the odometer label dot length, type:

`^XA  
^LL500  
^XZ`

2. To get the current odometer label dot length, type:

`! U1 getvar "odometer.label_dot_length"`

Something similar to this is shown:

`"500"`

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.media\_marker\_count

This command refers to the non-resettable media marker count. The media marker counter keeps track of how many labels have passed through the printer by counting the bar sense marks on the back of the media or the gap in gap media. Labels are counted whether or not they have been printed.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "odometer.media_marker_count" "value" <b>Values:</b> "0" to "4294967295" <b>Default:</b> "0"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "odometer.media_marker_count" <b>Example:</b> "105"

### Supported Devices

- S4M
- Z4MPlus, Z6MPlus
- 105SL
- 110XiIIIPlus, 140XiIIIPlus, 170XiIIIPlus, 220XiIIIPlus
- 110Xi4, 140Xi4, 170Xi4
- 110PAX4
- GK420t, GK420d, GK888t
- LP 2824 Plus
- QL420+

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.media\_marker\_count1

This printer setting refers to the value of the first (count1) user resettable counter. The user resettable counters track how much media has passed through the printer in both inches or centimeters.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to reset the first user resettable counter.</p> <p><b>Format:</b>  <b>! U1 setvar "odometer.media_marker_count1" "value"</b></p> <p><b>Values:</b>          "0" = reset the counter</p> <p><b>Default:</b> must be an accepted value or it is ignored</p>
<b>getvar</b>	<p>This command instructs the printer to return the current value of the first (count1) user resettable counter in both inches and centimeters.</p> <p><b>Format:</b> <b>! U1 getvar "odometer.media_marker_count1"</b></p>

**Example:** This example shows how to get the first user resettable counter, how to reset it, and how to confirm the settings have changed:

1. To see the current settings, type:  
`! U1 getvar "odometer.media_marker_count1"`  
 Something similar to this is shown:  
`"8516 INCHES, 21632 CENTIMETERS"`
2. To reset these values to 0, type:  
`! U1 setvar "odometer.media_marker_count1" "0"`
3. To confirm these settings were reset, type:  
`! U1 getvar "odometer.media_marker_count1"`  
 If the resetting was successful, this is shown:  
`"0 INCHES, 0 CENTIMETERS"`

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.media\_marker\_count2

This printer setting refers to the value of the second (count2) user resettable counter. The user resettable counters track how much media has passed through the printer in both inches or centimeters.

Commands	Details
<b>setvar</b>	This command instructs the printer to reset the second user resettable counter. <b>Format:</b> <b>! U1 setvar "odometer.media_marker_count2" "value"</b> <b>Values:</b> "0" = reset the counter <b>Default:</b> must be an accepted value or it is ignored
<b>getvar</b>	This command instructs the printer to return the current value of the second (count2) user resettable counter in both inches and centimeters. <b>Format:</b> <b>! U1 getvar "odometer.media_marker_count2"</b>

**Example:** This example shows how to get the second user resettable counter, how to reset it, and how to confirm the settings have changed:

1. To see the current settings, type:  
**! U1 getvar "odometer.media\_marker\_count2"**  
Something similar to this is shown:  
**"8516 INCHES, 21632 CENTIMETERS"**
2. To reset these values to 0, type:  
**! U1 setvar "odometer.media\_marker\_count2" "0"**
3. To confirm these settings were reset, type:  
**! U1 getvar "odometer.media\_marker\_count2"**  
If the resetting was successful, this is shown:  
**"0 INCHES, 0 CENTIMETERS"**

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.retracts\_count

This printer value records the number of times a label has been retracted since the last time the counter has been reset.

Commands	Details
setvar	<p>This command instructs the printer to reset the current count of retractions.</p> <p><b>Format:</b></p> <pre>! U1 setvar "odometer.retracts_count" "value"</pre> <p><b>Values:</b></p> <p>0 = reset the counter</p> <p><b>Default:</b> none</p>
getvar	<p>This command instructs the printer to respond with the current number of retractions that have happened since the last time the counter was reset.</p> <p><b>Format:</b></p> <pre>! U1 getvar "odometer.retracts_count"</pre>

### Supported Devices

- KR403

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.total\_print\_length

This command tracks the total length of media that printed over the life of the printer.

Commands	Details
getvar	<p>This command returns the value of the total length of media that printed over the life of the printer.</p> <p><b>Format:</b> ! U1 getvar "odometer.total_print_length"</p>

→ **Example:** This example shows how to get the total length of media that printed over the life of the printer.

1. To get the total length of media that has printed to date, type:

**! U1 getvar "odometer.total\_print\_length"**

Something similar to this is shown:

**"8560 INCHES, 21744 CENTIMETERS"**

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## odometer.rfid.valid\_resettable

This command resets the RFID valid label counter to zero.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the RFID valid counter to zero.</p> <p><b>Format:</b> ! U1 setvar "odometer.rfid.valid_resettable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>(ZD500R only) "0"</li> <li>(other RFID printers) "reset"</li> </ul>
<b>getvar</b>	<p>This command instructs the printer to respond with the current RFID valid counter value.</p> <p><b>Format:</b> ! U1 getvar "odometer.rfid.valid_resettable"</p>

**Example:** This **setvar** example shows how the counter portion of the printer configuration labels looks when the RFID valid counter is reset by sending:

**ZD500R only:**

```
! U1 setvar "odometer.rfid.valid_resettable" "0"
```

**Other RFID printers:**

```
! U1 setvar "odometer.rfid.valid_resettable" "reset"
```

## odometer.rfid.void\_resettable

This command resets the RFID void label counter to zero.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the RFID void counter to zero.</p> <p><b>Format:</b> ! U1 setvar "odometer.rfid.void_resettable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>(ZD500R only) "0"</li> <li>(other RFID printers) "reset"</li> </ul>
<b>getvar</b>	<p>This command instructs the printer to respond with the current RFID void counter value.</p> <p><b>Format:</b> ! U1 getvar "odometer.rfid.void_resettable"</p>

**Example:** This **setvar** example shows how the counter portion of the printer configuration labels looks when the RFID void counter is reset by sending:

**ZD500R only:**

```
! U1 setvar "odometer.rfid.valid_resettable" "0"
```

**Other RFID printers:**

```
! U1 setvar "odometer.rfid.valid_resettable" "reset"
```

## odometer.total\_cuts

Displays the total number of cuts incurred by the cutter.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "odometer.total_cuts" "value" <b>Default:</b> 0
<b>getvar</b>	<b>Format:</b> ! U1 getvar "odometer.total_cuts"  <b>Note</b> • On printers where this command is used for the first time as part of a firmware update, the initial value will be "0" even though the printer will have made previous cuts.

### Supported Devices

- ZD410, ZD420
- ZD500
- ZT210, ZT220, ZT230
- ZT410

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## parallel\_port.mode

This command sets the mode type for the parallel port.

Commands	Details
<b>setvar</b>	This command sets the mode type for the parallel port. <b>Format:</b> ! U1 setvar "parallel_port.mode" "value" <b>Values:</b> "bidirectional" "unidirectional" <b>Default:</b> "bidirectional"
<b>getvar</b>	This command retrieves the current mode type setting for the parallel port. <b>Format:</b> ! U1 getvar "parallel_port.mode"

### Example:

```
! U1 setvar "parallel_port.mode" "bidirectional"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## parallel\_port.present

This command reports if there is a parallel port in the printer.

Commands	Details
getvar	<p>This command reports if there is a parallel port in the printer.</p> <p><b>Format:</b> ! U1 getvar "parallel_port.present"</p> <p><b>Result:</b></p> <ul style="list-style-type: none"><li>"present"</li><li>"not installed"</li></ul>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.battery\_led\_blink\_rate

Sets the Extended Smart Battery LED blink rate. The rate is set in multiples of 0.5 seconds.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "power.battery_led_blink_rate" "value" <b>Values:</b> a number from 0 to 127. The rate is set in multiples of 0.5 seconds. <b>Default:</b> "2"
getvar	<b>Format:</b> ! U1 getvar "power.battery_led_blink_rate" <b>Result:</b> a number from 0 to 127. The rate is set in multiples of 0.5 seconds.

### Supported Devices

- ZQ510
- ZQ520

**Example:** The rate is set in multiples of 0.5 seconds.

To achieve an On time of 1 second, and Off time of 4.5 seconds one would use the following configuration:

On Duration = 2 ( $2 * 0.5 = 1$  second) (xref power.battery\_led\_on\_duration)

Off Duration = 9 ( $9 * 0.5 = 4.5$  seconds) (xref power.battery\_led\_off\_duration)

Blink Rate = 2 ( $2 * 0.5 = 1$  second)

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.battery\_led\_enable

This command will enable or disable the illumination of the Extended Smart battery LED when one or more of the **power.battery** thresholds have been reached.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "power.battery_led_enable" "value" <b>Values:</b> "on" = enables the Extended Smart battery LED "off" = disables the Extended Smart battery LED <b>Default:</b> "on"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "power.battery_led_enable"

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.battery\_led\_off\_duration

Sets the Extended Smart Battery Led Off duration. The rate is set in multiples of 0.5 seconds.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "power.battery_led_off_duration" "value" <b>Values:</b> A number between 0 and 255. The rate is set in multiples of 0.5 seconds. <b>Default:</b> "9"
getvar	<b>Format:</b> ! U1 getvar "power.battery_led_off_duration"

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.battery\_led\_on\_duration

Sets the Extended Smart Battery Led On duration. The rate is set in multiples of 0.5 seconds.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "power.battery_led_on_duration" "value" <b>Values:</b> A number between 0 and 255. The rate is set in multiples of 0.5 seconds. <b>Default:</b> "2"
getvar	<b>Format:</b> ! U1 getvar "power.battery_led_on_duration"

### Supported Devices

- ZQ510. ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.battery\_replacement\_cyclecount\_threshold

This printer setting configures when the Extended Smart Battery's LED will illuminate, based upon the charge cycle count. The LED illuminates when the cycle count for the battery reaches the value set by this command.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "power.battery_replacement_cyclecount_threshold" "value" <b>Values:</b> 100 to 2450 <b>Default:</b> "551"
getvar	<b>Format:</b> ! U1 getvar "power.battery_replacement_cyclecount_threshold"

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.dtr\_power\_off

This command refers to the remote printer power control, and is used for power management. When Data Terminal Ready (DTR) is enabled the printer can be powered on and off via the Data Set Ready (DSR) signal. When DTR power off is enabled, a low to high transition will cause the printer to turn ON and a high to low transition will cause the printer to turn OFF.

**Note** • The inactivity time-out is disabled while DSR is active.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn DTR power on or off. <b>Format:</b> ! U1 setvar "power.dtr_power_off" "value" <b>Values:</b> "off" "on" <b>Default:</b> "on"
<b>getvar</b>	This command retrieves the current DTR power-off setting. <b>Format:</b> ! U1 getvar "power.dtr_power_off"

**Example:**

```
! U1 setvar "power.dtr_power_off" "off"
```

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.label\_queue.shutdown

Specifies if the printer should wait to shut down until all labels in its internal queue have been printed.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "power.label_queue.shutdown" "value" <b>Values:</b> "yes" = printer will wait to shut down until all labels in its internal queue have been printed "no" = printer will not wait to shut down until all labels in its internal queue have been printed <b>Default:</b> "no"
getvar	<b>Format:</b> ! U1 getvar "power.label_queue.shutdown"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## power.shutdown

Instructs the printer to shut down.

Commands	Details
do	Format: ! U1 do "power.shutdown" ""

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## print.tone

This command specifies the printer darkness.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the darkness and relative darkness.</p> <p><b>Format:</b> ! U1 setvar "print.tone" "value"</p> <p><b>Values:</b></p> <p>"0.0" to "30.0" = darkness</p> <p>"-0.1" to "-30.0" and "+0.1" to "+30.0" = incremental adjustments</p> <p><b>Default:</b> "4.0"</p>
<b>getvar</b>	<p>This command retrieves the printer's current darkness setting.</p> <p><b>Format:</b> ! U1 getvar "print.tone"</p>

**Example:** This **setvar** example shows the value set to "4.0".

**! U1 setvar "print.tone" "4.0"**

When the **setvar** value is set to "4.0", the **getvar** result is "4.0".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.adaptive\_antenna

This command enables or disables adaptive antenna selection.

If the printer cannot find RFID tags with the antenna element specified during the number of retries specified (if applicable), the printer may try neighboring antenna elements. If the printer is unsuccessful communicating with the RFID tag after trying the neighboring antenna elements, the printer voids the label.

Commands	Details
<b>setvar</b>	<p>Enables or disables the adaptive antenna feature.</p> <p> <b>Note</b> •</p> <ul style="list-style-type: none"><li>• This command is valid only on R110Xi4 and ZT400 printers with a label that is 2 in. (51 mm) or longer.</li><li>• Activating this feature may slow throughput on damaged or weak RFID tags.</li><li>• </li></ul> <p><b>Format:</b> ! U1 setvar "rfid.adaptive_antenna" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li><b>none</b> = The printer uses only the current antenna element selection.</li><li><b>neighbors</b> = The printer attempts to read the tag using the antenna elements to the left/right and above/below the current antenna. The antenna element that is successful is used for all subsequent RFID commands until the next unsuccessful attempt.</li></ul> <p><b>Default:</b> <b>none</b></p>
<b>getvar</b>	<p>Retrieves the current adaptive antenna setting.</p> <p><b>Format:</b> ! U1 getvar "rfid.adaptive_antenna"</p>

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.antenna\_sweep

This command enables/disables the antenna sweep feature.

If the RFID media loaded in the printer is known to be in range of an antenna at the **F0** programming position, you can avoid RFID calibration by using the RFID antenna sweep feature. With this feature enabled, when the first RFID format is sent after a printer powerup or printhead close, the printer scans through the antennas to find the optimal antenna element.

Commands	Details
<b>setvar</b>	<p>Enables or disables the antenna sweep feature.</p> <p> <b>Note</b> • This command is valid only on R110Xi4 and ZT400 printers with a label that is 2 in. (51 mm) or longer and when using a program position of F0.</p> <p><b>Format:</b> ! U1 setvar "rfid.antenna_sweep" "value"</p> <p><b>Values:</b> on, off</p> <p><b>Default:</b> on</p>
<b>getvar</b>	<p>Retrieves the current antenna sweep setting.</p> <p><b>Format:</b> ! U1 getvar "rfid.adaptive_antenna"</p>

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.country\_code

This command sets or returns the RFID reader country code. The country code is restricted based on the region code assigned to the reader and, in some instances, cannot be modified. You can check the countries available for your region through the control panel menu items on your printer.

Commands	Details
<b>setvar</b>	Sets the RFID reader's current country code. <b>Format:</b> ! U1 setvar "rfid.country_code" "value" <b>Values:</b> The country code choices available will vary depending on the region for which your printer is configured.
<b>getvar</b>	Retrieves the RFID reader's current country code. <b>Format:</b> ! U1 getvar "rfid.country_code"

**Example:** In this example, the **setvar** sets the country code to USA/Canada.

```
! U1 setvar "rfid.country_code" "usa/canada"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.enable

This command instructs an RFID printer to enable or disable RFID functionality. You must restart the printer for the command to take effect.

**Note** • When this function is set to "on," changes are made to normal printer functionality.  
Loading printer defaults does NOT:

- Default the sensor select setting
- Default media tracking sensor settings
- Default label length
- Perform an auto calibration

Commands	Details
<b>setvar</b>	<p>Enables or disables RFID functionality.</p> <p><b>Format:</b> ! U1 setvar "rfid.enable" "value"</p> <p><b>Values:</b></p> <p style="padding-left: 20px;">on = enables RFID functionality</p> <p style="padding-left: 20px;">off = disables RFID functionality</p> <p><b>Default:</b> on</p>

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.error.response

This command can be used to retrieve the RFID status, including any error codes or messages.

Commands	Details
getvar	Retrieves any active RFID error messages. <b>Format:</b> ! U1 getvar "rfid.error.response"

**Example:** This `getvar` example shows responses that you may get in different situations:

`! U1 getvar "rfid.error.response"`

If no RFID tag is present, you get the following response:

NO TAG FOUND

If an RFID tag is present and there are no errors, you get the following response:

RFID OK

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.hop\_table\_version

This command retrieves the RFID reader's hop table version.

Commands	Details
getvar	Retrieves the RFID reader's hop table version. <b>Format:</b> ! U1 getvar "rfid.hop_table_version"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# rfid.position.program

This command sets the read/write position of the RFID tag (programming position).

**Important** • If this command is used to specify a value for the programming position, this value will be used for the programming position for all labels until a new position is specified or until the tag calibration procedure is run.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the read/write position of the RFID tag.</p> <p><b>Format:</b> ! U1 setvar "rfid.position.program" "value"</p> <p><b>Values:</b></p> <p><b>For the ZD500R only:</b></p> <p><b>F0 to Fxxx</b> (where xxx is the label length in millimeters or 999, whichever is less)  The printer prints the first part of a label until it reaches the specified distance and then begins programming. After programming, the printer prints the remainder of the label.</p> <p><b>B0 to B30</b>  The printer backfeeds the label for the specified distance and then begins programming. To account for the backfeed, allow empty media liner to extend out of the front of the printer when using a backward programming position.</p> <p><b>up</b> = move to the next value  <b>down</b> = move to the previous value</p> <p><b>For other RFID printers:</b></p> <p><b>Absolute Mode</b> (all firmware versions):  <b>xxxx = 0</b> to label length (in dot rows). Move the media to the specified position xxxx on the label, measured in dot rows from the label top, before encoding. Set to 0 (no movement) if the tag is already in the effective area without moving the media.</p> <p><b>Relative Mode</b> (firmware versions V53.17.6 and later):  <b>F0 to Fxxx</b> (where xxx is the label length in millimeters or 999, whichever is less)  The printer prints the first part of a label until it reaches the specified distance and then begins programming. After programming, the printer prints the remainder of the label.</p> <p><b>B0 to B30</b> (Does not apply to the RP4T printer.)  The printer backfeeds the label for the specified distance and then begins programming. To account for the backfeed, allow empty media liner to extend out of the front of the printer when using a backward programming position.</p>
<b>setvar</b> (continued)	<p><b>Default:</b></p> <p><b>For the R2844-Z and RPAX:</b> 0 (no movement)</p> <p><b>For printers using V53.17.7 and later:</b> F0 (which moves the leading edge of the label to the print line)</p> <p><b>For all other printers or firmware:</b> label length minus 1 mm (1/16 in.)</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the current programming position.</p> <p><b>Format:</b> ! U1 getvar "rfid.position.program"</p>

→ **Example:** This example shows the programming position being set at 15 mm from the leading edge of the label.

```
! U1 setvar "rfid.position.program" "F15"
```

When the **setvar** value is set to "**F15**", the **getvar** result is **F15**.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.reader\_1.antenna\_port

This command specifies the RFID antenna to be used for RFID operation.

**Note** • Some printers automatically select the best antenna element and read/write power levels for the media during RFID transponder calibration. You may also set the levels during an adaptive antenna sweep. Use the [^HL or ~HL](#) command (see [^HL or ~HL on page 377](#)) to view the antenna element and power settings being used.

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

Commands	Details
<b>setvar</b>	<p>Sets the antenna port.</p> <p><b>Format:</b> ! U1 setvar "rfid.reader_1.antenna_port" "value"</p> <p><b>ZD500R:</b> This printer only has one antenna element, so the value used is always <b>A1</b>.</p> <p><b>Default:</b> A1</p> <p><b>ZT400:</b> This parameter selects an antenna element from the printer's antenna array.</p> <p><b>Values:</b></p> <p>E1, E2, E3, E4 D1, D2, D3, D4 C1, C2, C3, C4 B1, B2, B3, B4 A1, A2, A3, A4</p>  <p><b>Default:</b> A4</p> <p><b>(Continued on next page)</b></p>

Commands	Details
<b>setvar</b>	<p>(Continued from previous page)</p> <p><b>R110Xi4 (V53.17.5 and later):</b></p> <p><b>Values:</b></p> <p>a two-digit antenna value: A1, A2, A3, A4, B1, B2, B3, B4, C1, C2, C3, C4, D2, D3, D4, E2, E3, E4, F2, F3, F4 (combinations D1, E1, and F1 are invalid)</p>  <p><b>Default:</b> A4</p> <p><b>R110Xi HF (R65.X):</b></p> <p><b>Values:</b></p> <p>1 = antenna port 1 2 = antenna port 2</p> <p><b>Default:</b> 1</p>
<b>getvar</b>	<p>Retrieves the current antenna port.</p> <p><b>Format:</b> ! U1 getvar "rfid.reader_1.antenna_port"</p>

→ **Example:** This **setvar** example shows the selection of antenna port D3.

`! U1 setvar "rfid.reader_1.antenna_port" "D3"`

When the **setvar** value is set to "D3", the **getvar** result is "D3".

## rfid.reader\_1.power.read

This command sets the RFID reader power level for reading RFID tags.

**Note •** The R110Xi4 printer automatically selects the best antenna element and read/write power levels for the media during RFID transponder calibration. It may also set the levels during an adaptive antenna sweep. Use the **~HL** command (see [^HL or ~HL on page 377](#)) to view the antenna element and power settings being used.

Commands	Details		
<b>setvar</b>	<p>This command instructs the printer to set the antenna's read power level.</p> <p><b>Format:</b> ! U1 setvar "rfid.reader_1.power.read" "value"</p> <table> <tr> <td><b>R53.16.3Z:</b> <b>Values:</b> 0 to 30 <b>Default:</b> 16  <b>RP4T (all firmware versions), R53.16.4Z, V53.17.7, V74.19.6Z, and later:</b> <b>Values:</b><ul style="list-style-type: none"><li>• 0 to 30</li><li>• up = increase the current value by 1</li><li>• down = decrease the current value by 1</li></ul><b>Default:</b> "16"</td><td><b>R60.16.x, R62.16.x, R63.16.x, R65.16.x, SP994Q, SP999G, SP1027G, SP1056F, SP1082G, and later:</b> <b>Values:</b><ul style="list-style-type: none"><li>• 0 to 30</li><li>• high</li><li>• medium</li><li>• low</li></ul><b>Default:</b> low  <b>Older firmware:</b> <b>Values:</b><ul style="list-style-type: none"><li>• high</li><li>• medium</li><li>• low</li></ul><b>Default:</b> low</td></tr> </table>	<b>R53.16.3Z:</b> <b>Values:</b> 0 to 30 <b>Default:</b> 16  <b>RP4T (all firmware versions), R53.16.4Z, V53.17.7, V74.19.6Z, and later:</b> <b>Values:</b> <ul style="list-style-type: none"><li>• 0 to 30</li><li>• up = increase the current value by 1</li><li>• down = decrease the current value by 1</li></ul> <b>Default:</b> "16"	<b>R60.16.x, R62.16.x, R63.16.x, R65.16.x, SP994Q, SP999G, SP1027G, SP1056F, SP1082G, and later:</b> <b>Values:</b> <ul style="list-style-type: none"><li>• 0 to 30</li><li>• high</li><li>• medium</li><li>• low</li></ul> <b>Default:</b> low  <b>Older firmware:</b> <b>Values:</b> <ul style="list-style-type: none"><li>• high</li><li>• medium</li><li>• low</li></ul> <b>Default:</b> low
<b>R53.16.3Z:</b> <b>Values:</b> 0 to 30 <b>Default:</b> 16  <b>RP4T (all firmware versions), R53.16.4Z, V53.17.7, V74.19.6Z, and later:</b> <b>Values:</b> <ul style="list-style-type: none"><li>• 0 to 30</li><li>• up = increase the current value by 1</li><li>• down = decrease the current value by 1</li></ul> <b>Default:</b> "16"	<b>R60.16.x, R62.16.x, R63.16.x, R65.16.x, SP994Q, SP999G, SP1027G, SP1056F, SP1082G, and later:</b> <b>Values:</b> <ul style="list-style-type: none"><li>• 0 to 30</li><li>• high</li><li>• medium</li><li>• low</li></ul> <b>Default:</b> low  <b>Older firmware:</b> <b>Values:</b> <ul style="list-style-type: none"><li>• high</li><li>• medium</li><li>• low</li></ul> <b>Default:</b> low		
<b>getvar</b>	<p>Retrieves the antenna's current read power level.</p> <p><b>Format:</b> ! U1 getvar "rfid.reader_1.power.read"</p>		

**Example:** This **setvar** example sets the antenna to power setting 16 for reading RFID tags.

```
! U1 setvar "rfid.reader_1.power.read" "16"
```

When the **setvar** value is set to "16", the **getvar** result is **16**.

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## rfid.reader\_1.power.write

Use this command to set the RFID write power levels if the desired levels are not achieved through RFID tag calibration. If not enough power is applied, the tag may not have sufficient power for programming, and tag data will fail to encode. If too much power is applied, the extra power may cause data communication errors or may cause the wrong tag to be programmed.

**Note** • The R110Xi4 printer automatically selects the best antenna element and read/write power levels for the media during RFID transponder calibration. It may also set the levels during an adaptive antenna sweep. Use the `~HL` command (see [^HL or ~HL on page 377](#)) to view the antenna element and power settings being used.

**Note** • This parameter is ignored on the R110Xi HF printer because read and write powers cannot be specified separately. See [rfid.reader\\_1.power.single\\_power on page 882](#) to set the power level for the R110Xi HF printer.

Commands	Details				
<b>setvar</b>	<p>This command instructs the printer to set the antenna's read power level.</p> <p><b>Format:</b> ! U1 setvar "rfid.reader_1.power.read" "value"</p> <table> <tr> <td><b>R53.16.3Z:</b> <b>Values:</b> 0 to 30 <b>Default:</b> 16</td><td><b>R60.16.x, R62.16.x, R63.16.x, R65.16.x, SP994Q, SP999G, SP1027G, SP1056F, SP1082G, and later:</b> <b>Values:</b> <ul style="list-style-type: none"> <li>• 0 to 30</li> <li>• <b>high</b></li> <li>• <b>medium</b></li> <li>• <b>low</b></li> </ul> <b>Default:</b> low</td></tr> <tr> <td><b>RP4T (all firmware versions), R53.16.4Z, V53.17.7, V74.19.6Z, and later:</b> <b>Values:</b> <ul style="list-style-type: none"> <li>• 0 to 30</li> <li>• <b>up</b> = increase the current value by 1</li> <li>• <b>down</b> = decrease the current value by 1</li> </ul> <b>Default:</b> "16"</td><td><b>Older firmware:</b> <b>Values:</b> high, medium, low <b>Default:</b> low</td></tr> </table>	<b>R53.16.3Z:</b> <b>Values:</b> 0 to 30 <b>Default:</b> 16	<b>R60.16.x, R62.16.x, R63.16.x, R65.16.x, SP994Q, SP999G, SP1027G, SP1056F, SP1082G, and later:</b> <b>Values:</b> <ul style="list-style-type: none"> <li>• 0 to 30</li> <li>• <b>high</b></li> <li>• <b>medium</b></li> <li>• <b>low</b></li> </ul> <b>Default:</b> low	<b>RP4T (all firmware versions), R53.16.4Z, V53.17.7, V74.19.6Z, and later:</b> <b>Values:</b> <ul style="list-style-type: none"> <li>• 0 to 30</li> <li>• <b>up</b> = increase the current value by 1</li> <li>• <b>down</b> = decrease the current value by 1</li> </ul> <b>Default:</b> "16"	<b>Older firmware:</b> <b>Values:</b> high, medium, low <b>Default:</b> low
<b>R53.16.3Z:</b> <b>Values:</b> 0 to 30 <b>Default:</b> 16	<b>R60.16.x, R62.16.x, R63.16.x, R65.16.x, SP994Q, SP999G, SP1027G, SP1056F, SP1082G, and later:</b> <b>Values:</b> <ul style="list-style-type: none"> <li>• 0 to 30</li> <li>• <b>high</b></li> <li>• <b>medium</b></li> <li>• <b>low</b></li> </ul> <b>Default:</b> low				
<b>RP4T (all firmware versions), R53.16.4Z, V53.17.7, V74.19.6Z, and later:</b> <b>Values:</b> <ul style="list-style-type: none"> <li>• 0 to 30</li> <li>• <b>up</b> = increase the current value by 1</li> <li>• <b>down</b> = decrease the current value by 1</li> </ul> <b>Default:</b> "16"	<b>Older firmware:</b> <b>Values:</b> high, medium, low <b>Default:</b> low				
<b>getvar</b>	<p>Retrieves the antenna's current write power level.</p> <p><b>Format:</b> ! U1 getvar "rfid.reader_1.power.write"</p>				

**Example:** This `setvar` example sets the antenna to power setting 16 for writing to RFID tags.

```
! U1 setvar "rfid.reader_1.power.write" "16"
```

When the `setvar` value is set to "16", the `getvar` result is 16.

**Note** •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## rfid.reader\_1.power.single\_power

This command sets the RFID reader power level for reading and writing to RFID tags for readers with a single power level.

**Note** • This command applies only to the R110Xi HF printer, firmware version R65.X.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the power level for reading and writing.</p> <p><b>Format:</b> <code>! U1 setvar "rfid.reader_1.power.single_power" "value"</code></p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>high</li><li>medium</li><li>low</li></ul> <p><b>Default:</b> low</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the current power level.</p> <p><b>Format:</b> <code>! U1 getvar "rfid.reader_1.power.single_power"</code></p>

**Example:** This **setvar** example sets the antenna to high power for writing to RFID tags.

```
! U1 setvar "rfid.reader_1.power.single_power" "high"
```

When the **setvar** value is set to "high", the **getvar** result is "high".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.reader\_1.firmware\_version

This command returns the RFID reader firmware version.

Commands	Details
getvar	Format: ! U1 getvar "rfid.reader_1.firmware_version"

→ **Example:** This example shows responses that you get in different situations:

**! U1 getvar "rfid.reader\_1.firmware\_version"**

If an RFID reader is present and connected, you get the firmware version in the following format:

xx.xx.xx.xx

If there is no RFID reader or if the reader is not connected correctly, the response is blank.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.reader\_1.hardware\_version

This command returns the RFID reader hardware version.

Commands	Details
getvar	Format: ! U1 getvar "rfid.reader_1.hardware_version"

→ **Example:** This example shows responses that you get in different situations:

```
! U1 getvar "rfid.reader_1.hardware_version"
```

If an RFID reader is present and connected, you get the hardware version in the following format:

xx.xx.xx.xx

If there is no RFID reader or if the reader is not connected correctly, the response is blank.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.reader\_1.model

This command returns the printer's RFID reader model number. Possible values are as follows:

- M6E MICRO

Commands	Details
getvar	Format: ! U1 getvar "rfid.reader_1.model"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.recipe\_version

The RFID recipe file controls how the printer manages RFID tag encoding, according to the type of tag in use.

This command returns the version number of the RFID recipe file currently in use. The RFID recipe file is named RFIDRCPE.XML. The default location for this file is Z:RFIDRCPE.XML. If a file using the same name is stored in the E: memory location, it will be used instead of the file stored in the Z: memory location.

Commands	Details
getvar	Format: ! U1 getvar "rfid.recipe_version"

### Supported Devices <sup>1</sup>

- ZD500
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

1.

## rfid.region\_code

This command returns the region code assigned to the printer's RFID device. Possible values are as follows:

- not available
- usa/canada
- japan
- rest of world

Commands	Details
getvar	Retrieves the RFID region code. <b>Format:</b> ! U1 getvar "rfid.region_code"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.calibrate

Use this command to initiate tag calibration for RFID media. During the process, the printer moves the media, calibrates the RFID tag position, and determines the optimal settings for the RFID media being used. Depending on the printer, these settings include the programming position, the antenna element to use, and the read/write power level to use.

For more information about RFID tag calibration, refer to the *RFID Programming Guide* for your printer. A copy is available online at <http://www.zebra.com/manuals>.

Commands	Details
<b>setvar</b>	Initiates tag calibration for RFID media. <b>Format:</b> ! U1 setvar "rfid.tag.calibrate" "value" <b>Values:</b> <b>restore</b> <b>run</b>

→ **Example 1:** This **setvar** example restores the programming position back to the printer's default value.

```
! U1 setvar "rfid.tag.calibrate" "restore"
```

→ **Example 2:** This **setvar** example performs RFID tag calibration.

```
! U1 setvar "rfid.tag.calibrate" "run"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.data

This command tells the RFID reader to attempt to read a tag over the RFID antenna, even if the printhead is open. Results are returned to the host.

Before running this command, position an RFID label over the printer's RFID antenna.

For more information about this option and for the location of the RFID antenna, refer to the *RFID Programming Guide* for your printer. A copy is available online at <http://www.zebra.com/manuals>.

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the current tag's data. <b>Format:</b> ! U1 getvar "rfid.tag.data"

→ **Example 1:** This **getvar** example gets the current tag's data, assuming that an RFID label with data “0123456789ABCDEF12345678” is in place over the antenna.

```
! U1 setvar "rfid.tag.data"
```

The printer responds with **0123456789ABCDEF12345678**.

→ **Example 2:** This **getvar** example gets the current tag's data, assuming that no tag data can be read or that no tag is present.

```
! U1 setvar "rfid.tag.data"
```

The printer responds with **NO DATA**.

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.read.content

This command instructs the printer which data to read from the tag with the **rfid.tag.read.execute** command. (See [rfid.tag.read.execute on page 891](#).)

Commands	Details
<b>setvar</b>	<p>Instructs the printer which data to read from the tag with the <b>rfid.tag.read.execute</b> command.</p> <p><b>Format:</b> ! U1 setvar "rfid.tag.read.content" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li><b>epc</b> = reads the EPC data based on the EPC size specified in the RFID tag's protocol bits, up to 160 bits</li> <li><b>tid information</b> = reads the first 32 bits of the TID (Tag ID)</li> <li><b>password status</b> = reads the tag's access and kill passwords</li> <li><b>protocol bits</b> = reads the protocol bits from the EPC memory banks and converts that value to the EPC size</li> <li><b>memory bank sizes</b> = reads the EPC, TID, and user memory banks sizes</li> <li><b>up</b> = sets the command to the previous test</li> <li><b>down</b> = sets the command to the next test</li> </ul> <p><b>Default:</b> epc</p>
<b>getvar</b>	<p>Retrieves the current setting.</p> <p><b>Format:</b> ! U1 getvar "rfid.tag.read.content"</p>

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## rfid.tag.read.execute

This command reads the data specified by the **rfid.tag.read.content** command. (See [rfid.tag.read.content on page 890](#).)

Commands	Details
<b>setvar</b>	Reads the specified data. <b>Format:</b> ! U1 setvar "rfid.tag.read.execute"

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## rfid.tag.read.result\_line1

This command reports the results of the **rfid.tag.read.execute** command.

Commands	Details
getvar	Retrieves the results of the <b>rfid.tag.read.execute</b> command. Format: ! U1 getvar "rfid.tag.read.result_line1"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.read.result\_line2

This command reports the results of the **rfid.tag.read.execute** command.

Commands	Details
<b>getvar</b>	Retrieves the results of the <b>rfid.tag.read.execute</b> command. <b>Format:</b> ! U1 setvar "rfid.tag.read.result_line2"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.read.result\_line1\_alternate

This command reports the results of the **rfid.tag.read.execute** command.

Commands	Details
getvar	Retrieves the results of the <b>rfid.tag.read.execute</b> command. Format: ! U1 setvar "rfid.tag.read.result_line1_alternate"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.read.result\_line2\_alternate

This command reports the results of the **rfid.tag.read.execute** command.

Commands	Details
getvar	Retrieves the results of the <b>rfid.tag.read.execute</b> command. Format: ! U1 getvar "rfid.tag.read.result_line2_alternate"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.test

This command performs an RFID test. In the RFID test, the printer attempts to read and write to a transponder that you place over the RFID antenna. Results are displayed on the printer's control panel display. For more information about the RFID antenna location, refer to the *RFID Programming Guide* for your printer. A copy is available online at <http://www.zebra.com/manuals>.

In the slow version of the RFID test, the printer first displays the hardware version, the reader firmware version, and the program position. For printer support, see *SGD Command Support* on page 1365.

**Note** • This command is valid only on RP4T printers.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the programming position. <b>Format:</b> ! U1 setvar "rfid.tag.test" "value" <b>Values:</b> quick slow

→ **Example 1:** This **setvar** example performs a quick RFID test, which shows a pass or fail message.

```
! U1 setvar "rfid.tag.test" "quick"
```

→ **Example 2:** This **setvar** example performs a slow RFID test, which shows the success or failure of each read or write tag operation.

```
! U1 setvar "rfid.tag.test" "slow"
```

**Note** •

- For printer support, see *SGD Command Support* on page 1365.
- For details on SGD command structure, see *Command Structure* on page 611.

## rfid.tag.test.content

This command instructs the printer which test to perform on the tag with the **rfid.tag.test.execute** command. (See [rfid.tag.test.execute on page 898](#).)

Commands	Details
<b>setvar</b>	<p>Instructs the printer which test to perform on the tag with the <b>rfid.tag.test.execute</b> command.</p> <p><b>Format:</b> ! U1 setvar "rfid.tag.test.content" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li><b>quick</b> = performs a read EPC test and a write EPC test (using random data)</li><li><b>read</b> = performs a read EPC test</li><li><b>write</b> = performs a write EPC test (using random data)</li><li><b>up</b> = sets the command to the previous test</li><li><b>down</b> = sets the command to the next test</li></ul> <p><b>Default:</b> quick</p>
<b>getvar</b>	<p>Retrieves the current setting.</p> <p><b>Format:</b> ! U1 getvar "rfid.tag.test.content"</p>

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## rfid.tag.test.execute

This command tests the data specified by the **rfid.tag.test.content** command. (See [rfid.tag.test.content on page 897](#).)

Commands	Details
<b>setvar</b>	Tests the specified data. <b>Format:</b> ! U1 setvar "rfid.tag.test.execute"

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## rfid.tag.test.result\_line1

This command reports the results of the **rfid.tag.test.execute** command.

Commands	Details
<b>getvar</b>	Retrieves the results of the <b>rfid.tag.test.execute</b> command. <b>Format:</b> ! U1 setvar "rfid.tag.test.result_line1"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.test.result\_line2

This command reports the results of the **rfid.tag.test.execute** command.

Commands	Details
<b>getvar</b>	Retrieves the results of the <b>rfid.tag.test.execute</b> command. <b>Format:</b> ! U1 setvar "rfid.tag.test.result_line2"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rfid.tag.type

This command sets the reader's RFID tag type.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the reader's tag type. For the supported tag types, see <a href="#">Table 27 on page 902</a>.</p> <p><b>Format:</b> ! U1 setvar "rfid.tag.type" "value"</p> <p><b>Values:</b></p> <p><b>UHF Printers</b></p> <ul style="list-style-type: none"> <li><b>none</b> = None</li> <li><b>class0</b> = EPC Class 0</li> <li><b>class0+</b> = EPC Class 0 Plus</li> <li><b>class1_64bit</b> = EPC Class 1 64-bit</li> <li><b>class1_96bit</b> = EPC Class 1 96-bit</li> <li><b>ucode_epc_1_19</b> = UCODE EPC 1.19</li> <li><b>class0+_impinj</b> = Impinj Class 0 Plus</li> <li><b>ISO18000A</b> = ISO 18000-06A</li> <li><b>gen2</b> = EPC Class 1, Generation 2 (Gen 2)</li> <li><b>ISO18000B</b> = ISO 18000-06B</li> </ul> <p><b>HF Printers</b></p> <ul style="list-style-type: none"> <li><b>none</b> = None</li> <li><b>detect</b> = Auto detect (query tag to determine)</li> <li><b>tagit</b> = Tag*It (Texas Instruments Tagit tags)</li> <li><b>icode</b> = I*code (Phillips Icode tags)</li> <li><b>pico</b> = Pico Tag (Inside Technology's)</li> <li><b>ISO15693</b> = ISO 15693</li> <li><b>EPC</b> = EPC tag (13.56 MHz)</li> <li><b>UIC</b> = UID Tag</li> <li><b>mifare_ultralight</b> = Mifare UltraLight</li> </ul>
<b>getvar</b>	<p>This command instructs the printer to respond with the reader's current tag type.</p> <p><b>Format:</b> ! U1 getvar "rfid.tag.type"</p>

**Example:** This **setvar** example shows the reader's tag type being set to Gen 2.

```
! U1 setvar "rfid.tag.type" "gen2"
```

**Supported Tag Types** [Table 27](#) shows the tag types supported by different RFID printers/print engines and firmware versions. Depending on your country or on the firmware version that you are using, your printer may not support all of the tag types listed. If you specify an unsupported tag type, the printer uses the default value. If a tag type is shown as supported but does not work with your printer, you may need to upgrade the printer's firmware (see <http://www.zebra.com/firmware>).

**Table 27 • Supported Tag Types and Default Values**

Printer	UHF Printers												HF Printers	
	R53.17.7 and later	R60.13.X	R60.15.X and later	R62.13.X	R62.15.X and later	R63.13.X	R63.15.X and later	R110PAx4	R110Xi4	R110Xf/R170Xf	R4Mplus	RZ400 / RZ600	R110X HF	R2844-Z

# = Default value \* = Accepted value — = Not supported

a. Requires R60.13.0.13ZD or later.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## rtc.timezone

Specifies the POSIX-compliant time zone string. This string includes the following:

- the time zone character specifier
- the offset from UTC
- daylight savings time adjustment
- when to go on and off of daylight savings time (if it pertains to the timezone).

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "rtc.timezone" "value" <b>Values:</b> <a href="http://www.iana.org/time-zones">www.iana.org/time-zones</a> This site is updated periodically to reflect changes made by political bodies to time zone boundaries, UTC offsets, and daylight-saving rules.
<b>getvar</b>	<b>Format:</b> ! U1 getvar "rtc.timezone"

**Example:** If you live in New York in the United States, in the Eastern time zone, your **setvar** string may look like:

- ! U1 setvar "rtc.timezone"  
"EST5EDT4,M3.2.0/02:00:00,M11.1.0/02:00:00"

The "value" string can be translated as follows:

EST5 (Eastern Standard Time; 5 hours off UTC), EDT4 (Eastern Daylight Time; 4 hours off UTC), running from 2AM (/02; fully qualified: /02:00:00) from the second Sunday in March (M3.2.0/02) through 2AM (/02; fully qualified: /02:00:00) on the first Sunday in November (M11.1.0/02).

M indicates the Month follows, followed by the two-digit month, the week (1 is the first week in which the specified weekday occurs, and 5 indicates the last week of the month with that weekday) and the weekday (0 is Sunday). The time starts with a slash, and unspecified trailing fields default to zero.

Other examples for locations in the United States:

- US Central:  
! U1 setvar "rtc.timezone" "CST6CDT5,M3.2.0/02,M11.1.0/02"
- US Mountain:  
! U1 setvar "rtc.timezone" "MST7MDT6,M3.2.0/02,M11.1.0/02"
- US Pacific:  
! U1 setvar "rtc.timezone" "PST8PDT7,M3.2.0/02,M11.1.0/02"
- US Alaska:  
! U1 setvar "rtc.timezone" "AST9ADT8,M3.2.0/02,M11.1.0/02"
- US Hawaii:  
! U1 setvar "rtc.timezone" "HST10"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## sensor.cover\_open

This printer setting determines if the printer media cover is open.

Commands	Details
<b>getvar</b>	Displays if the printer cover is open or not. <b>Format:</b> ! U1 getvar "sensor.cover_open" <b>Values:</b> "yes" = the printer cover is open "no" = the printer cover is closed

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## sensor.paper\_supply

Returns current paper supply status.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "sensor.paper_supply" <b>Result:</b> Obtains current paper supply status: "ok" = printer has paper. "out" = printer is out of paper.

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## sensor.peeler

Obtains current peeler sensor status:

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "sensor.peeler" <b>Result:</b> "clear": the last printed item has been removed, or there are no items waiting to be removed. "not clear": last printed item has not yet been removed.

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.device\_id\_string

This command retrieves the manufacturer assigned IEEE1284 Device Identification string for USB devices.

Commands	Details
getvar	This command retrieves the device ID string. <b>Format:</b> ! U1 getvar "usb.device.device_id_string"

### Example:

```
! U1 getvar "usb.device.device_id_string"
```

### Result:

```
"MANUFACTURER:Zebra Technologies ;COMMAND SET:ZPL;MODEL:ZTC ZT220-200dpi  
ZPL;CLASS:PRINTER;OPTIONS:XML;"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.device\_unique\_id

This command sets the USB Unique Device ID setting. The identifier that makes any printer unique is set by the "usb.device.serial\_string" command which is reported to the USB driver.

By default "usb.device.serial\_string" reports the printer's serial number. If "usb.device.unique\_id" is set to "off" the printer will report the `usb.device.serial_string` parameter as its product family (e.g. ZT230, etc).

When subsequent printers of the same model, with "usb.device.unique\_id" parameter to "off", are connected via USB, the host computer will not treat them as a new Plug and Play events, nor require new driver installations.

Commands	Details
<b>setvar</b>	<p>This command sets the current USB Unique Device Id setting.</p> <p><b>Format:</b> ! U1 setvar "usb.device.device_unique_id" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off"</li> <li>"on"</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command returns the current USB Unique Device Id setting stored in the printer.</p> <p><b>Format:</b> ! U1 getvar "usb.device.device_unique_id"</p>

### Example:

```
! U1 setvar "usb.device.device_unique_id" "off"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.device\_version

This command returns the version of the USB device being queried.

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the printer's USB version. <b>Format:</b> ! U1 getvar "usb.device.device_version"

**Example:**

```
! U1 getvar "usb.device.device_version"
```

**Result:** "1.1"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.manufacturer\_string

This command retrieves the USB device manufacturer's name.

Commands	Details
getvar	This command instructs the printer to respond with the manufacturer name. <b>Format:</b> ! U1 getvar "usb.device.manufacturer_string"

### Example:

```
! U1 getvar "usb.device.manufacturer_string"
```

**Result:** "Zebra Technologies"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.product\_id

This command retrieves the Product Identification number that a manufacturer assigned to a particular product. This number, along with the Vendor ID, allows a USB host to distinguish between devices.

Commands	Details
<b>getvar</b>	This command retrieves the product ID. <b>Format:</b> ! U1 getvar "usb.device.product_id"

### Example:

```
! U1 getvar "usb.device.product_id"
```

**Result:** "003D"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.product\_string

This command returns the manufacturer-assigned string describing a particular USB product.

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the product string description. <b>Format:</b> ! U1 getvar "usb.device.product_string"

### Supported Devices

- ZT200 Series
- QLn Series

**Example:** Issuing the command on a ZT210 printer:

```
! U1 getvar "usb.device.product_string"
```

**Result:** "ZT210"

Issuing the command on a QLn320 printer:

```
! U1 getvar "usb.device.product_string"
```

**Result:** "ZTC QLn320-203dpi CPCL"

**Note** • For firmware V68.19.0 and V72.19.0, the return value was changed to the longer name, which is the same as the USB PID. The QLnXXX is replaced by the printer model and number for each printer.

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.serial\_string

This command returns the manufacturer-assigned serial number for a particular USB product.

Commands	Details
getvar	This command returns the printer's serial number. <b>Format:</b> ! U1 getvar "usb.device.serial_string"

### Example:

```
! U1 getvar "usb.device.serial_string"
```

**Result:** "ABC1234567890"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.device.vendor\_id

This command returns the Vendor Identification number that the USB-IF organization has assigned to a manufacturer. This number, along with the Product ID, allows a USB host to distinguish between devices.

Commands	Details
<b>getvar</b>	This command retrieves the vendor ID of the device. <b>Format:</b> ! U1 getvar "usb.device.vendor_id"

### Example:

```
! U1 getvar "usb.device.vendor_id"
```

**Result:** "0a5f"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.halt

This command controls whether the printer allows communication over the USB port when the printer is in an error condition.

Commands	Details
<b>setvar</b>	This command controls whether the printer allows communication over the USB port when the printer is in an error condition. <b>Format:</b> ! U1 setvar "usb.halt" "value" <b>Values:</b> "yes" "no" <b>Default:</b> "no"
<b>getvar</b>	This command returns the current "usb.halt" setting stored in the printer. <b>Format:</b> ! U1 getvar "usb.halt"

### Example:

```
! U1 setvar "usb.halt" "yes"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## usb.host.fn\_field\_data

This command is used to collect a user's response to a presented ^FN prompt.

**Important** • This command is used only in the context of the on-printer Print Station application. Altering the use of this command in the WML can make the Print Station application non-functional. It is recommended changes to portions of this portion of the menu system be done by Zebra Professional Services team.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.host.fn_field_data" "value" <b>Values:</b> the text entered by the user via a USB Human Interface Device (HID) keyboard <b>Default:</b> "NULL"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.host.fn_field_data" <b>Result:</b> One of the following: NULL the current user response to an ^FN prompt

### Supported Devices

- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.fn\_last\_field

This command is intended for use by WML code to control the presentation of ^FN fields contained within a template file that resides on the E:/ drive and has an extension of .ZPL.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "usb.host.fn_last_field" <b>Result:</b> YES or NO

### Supported Devices

- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.hid\_count

This command displays the number of USB Human Interface Devices (HIDs) connected to the printer. Refer to <http://www.usb.org> for further details on USB device types.

Commands	Details
getvar	<p><b>Format:</b> ! U1 getvar "usb.host.hid_count"</p> <p><b>Example:</b> When no devices are attached: ! U1 getvar "usb.host.hid_count" <b>Result:</b> "0"</p>

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.keyboard\_input

This command enables/disables USB keyboard input to the printer, affecting the Print Station user menu item.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.host.keyboard_input" <b>Values:</b> "on"—keyboard input is supported. "off"—keyboard input is not supported <b>Default:</b> "on"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.host.keyboard_input"

### Supported Devices

- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.lock\_out

This command enables/disables the USB host port.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.host.lock_out" "value" <b>Values:</b> "on"—the USB host port is enabled. "off"—the USB host port is disabled <b>Default:</b> "on"
getvar	<b>Format:</b> ! U1 getvar "usb.host.lock_out"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.mass\_storage\_count

This command displays the number of USB mass storage devices connected to the printer. Only the first USB mass storage device found will be mounted and accessible.

Commands	Details
getvar	Format: ! U1 getvar "usb.host.mass_storage_count"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.read\_list

This command scans the mounted usb mass storage device for non-user-restricted files and displays the files in a list.

Commands	Details
setvar	<p><b>Format:</b> ! U1 setvar "usb.host.read_list" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"<b>fill_store</b>"—The printer creates a list of all of the top-level files that are readable on a connected mass storage device. (.ZPL and .XML files)</li> <li>"<b>store</b>"—The printer copies the current file (the file listed on the display) or all eligible files if <b>SELECT ALL</b> is displayed from the USB mass storage device to the printer's E: drive.</li> </ul> <p><b>Important</b> • Store does an exact byte-for-byte copy of the file being stored. ZPL files that are transferred to the printer using the "store" command are NOT prepared to be used with a recall format command (^XF). See XREF Character Substitution (in Mirror) for the modifications necessary to prepare a ZPL file for use with ^XF. If the ZPL file contains a ^DF, the appropriate way to place it on the printer's memory is to use the "<b>print</b>" command, below.</p> <ul style="list-style-type: none"> <li>"<b>fill_print</b>"—The printer analyzes the content of the USB mass storage device and creates a list of files that may be printed. (.ZPL files only)</li> <li>"<b>print</b>"—The printer prints the current file (the file listed on the display) or all eligible files if <b>SELECT ALL</b> is displayed.</li> <li>"<b>clear</b>" -</li> </ul>
getvar	<p><b>Format:</b> ! U1 getvar "usbusb.host.read_list"</p> <p><b>Result:</b> the current file in the list or <b>NONE</b></p>

### Supported Devices

- ZT410, ZT420

### Example:

```
! U1 getvar "usbusb.host.read_list"
```

### Result:

One of the following:

- The current file in the list.
- **NONE** if there are no files on the USB mass storage device.

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.read\_list\_print\_delay

This command specifies a number of milliseconds for the printer to wait before processing the next file when “**SELECT ALL**” is chosen on the **USB PRINT FILES** user menu.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.host.read_list_print_delay" <b>Values:</b> 0 to 65535 <b>Default:</b> "0"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.host.read_list_print_delay"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.template\_list

This command is used by WML to support selecting .ZPL template files resident on the E:/ drive.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.host.template_list" "value" "fill"—The printer analyzes the contents of its E:/ drive and creates a list of the template files with a .ZPL extension. "up" - moves to the previous file in the list "down" - moves to the next file in the list <b>Default:</b> "on"
getvar	<b>Format:</b> ! U1 getvar "usb.host.template_list" <b>Result:</b> One of the following: <b>UNINITIALIZED</b> <b>IN PROGRESS</b> <b>NONE</b> (if no .ZPL files reside on the E:/ drive) the current .ZPL file

### Supported Devices

- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.template\_print\_amount

This command is used by WML to control the number of template-type labels to print.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.host.template_print_amount" "value" <b>Values:</b> 1 to 99999 "up" - moves to the previous file in the list "down" - moves to the next file in the list <b>Default:</b> "1" which will change based on the contents of the selected template file
getvar	<b>Format:</b> ! U1 getvar "usb.host.template_print_amount" <b>Result:</b> the current value

### Supported Devices

- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.host.write\_list

This command scans the E: flash drive for non-user-restricted files and displays the files in a list.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.host.write_list" "value"  "fill_store"—The printer analyzes the contents of its E: drive and creates a list of files that may be copied to a USB mass storage device connected to the printer. "store"—The printer copies the current file (the file listed on the display) or all eligible files if <b>SELECT ALL</b> is displayed to the USB mass storage device. "up" "down" <b>Default:</b> "on"
getvar	<b>Format:</b> ! U1 getvar "usb.host.write_list" <b>Result:</b> One of the following: <ul style="list-style-type: none"><li>The current file in the list.</li><li><b>NONE</b> if there are no files on the printer's E: drive.</li><li><b>READONLY</b> if the USB mass storage device is read-only.</li></ul>

### Supported Devices

- ZT400 Series

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.appl\_path

This command specifies the path to the location on a USB device from which Mirror files are retrieved. If no path is specified, then the path is **zebra/appl**.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.mirror.appl_path" "path" <b>Values:</b> a valid path up to 255 characters <b>Default:</b> "zebra/appl"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.mirror.appl_path"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.auto

This command determines if mirroring happens automatically when a USB device is inserted in the printer. To use this function, the setting for **usb.mirror.enable** must be "**on**".

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.mirror.auto" "value" <b>Values:</b> "on"—mirroring occurs automatically when the USB device is inserted and <b>usb.mirror.enable</b> is on. "off"—mirroring does not occur automatically when the USB device is inserted. "prompt"—the printer gives you the option to start or abort a mirroring process. <b>Default:</b> "on"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.mirror.auto"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.enable

This command enables or disables the ability to perform mirroring of a USB device.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.mirror.enable" "value" <b>Values:</b> "on"—mirroring is enabled "off"—mirroring is disabled <b>Default:</b> "on"
getvar	<b>Format:</b> ! U1 getvar "usb.mirror.enable"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.error\_retry

This command specifies the number of times that the USB mirror operation will be repeated if the process fails.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.mirror.error_retry" "value" <b>Values:</b> 0 to 65535 <b>Default:</b> "0"
getvar	<b>Format:</b> ! U1 getvar "usb.mirror.error_retry"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.feedback.auto

This command determines if a feedback file is written to the USB device connected to the printer after mirroring.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.mirror.feedback.auto" "value" "on"—a feedback file is written to the USB device connected to the printer. "off"—a feedback file is not written to the USB device connected to the printer. <b>Default:</b> "off"
getvar	<b>Format:</b> ! U1 getvar "usb.mirror.feedback.auto"

### Supported Devices

- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.feedback.odometer

This command instructs the printer to set or retrieve the **usb.mirror.feedback.odometer** value.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.mirror.feedback.odometer" "value" <b>Values:</b> 0 to 65535 <b>Default:</b> "0" <b>Example:</b> This example sets the counter to 0, which resets the counter. ! U1 setvar "usb.mirror.feedback.odometer" "0"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.mirror.feedback.odometer"

### Supported Devices

- ZT400 Series
- ZQ500 Series

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.feedback.path

This command specifies where the feedback file is stored on the USB drive connected to the printer.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "usb.mirror.feedback.path" "value" <b>Values:</b> a valid path up to 255 characters <b>NOTE:</b> The path must exist on the USB drive before the printer can write files to it. <b>Default:</b> "zebra/feedback"
getvar	<b>Format:</b> ! U1 getvar "usb.mirror.feedback.path"

### Supported Devices

- ZT400 Series
- ZQ500 Series

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.fetch

This command immediately initiates a USB mirroring operation. To use this function, the setting for **usb.mirror.enable** must be "on".

Commands	Details
do	Format: ! U1 do "usb.mirror.fetch"

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.last\_error

This command returns the last USB mirroring error string. If there are no errors, the result is "No Error".

Commands	Details
getvar	Format: ! U1 getvar "usb.mirror.last_error"

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.last\_time

This command returns the date and time of the last USB mirroring operation. The date and time reported are from the printer's clock.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "usb.mirror.last_time" <b>Result:</b> 02 18 2015 11:10:09 (mm dd yyyy hh:mm:ss)

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.path

This command specifies the root directory on the connected USB drive. The root directory contains the subdirectories from which files are retrieved during the mirror operation. If no path is specified, then the path is **/zebra**.

The standard subdirectories to use are:

- "<update-root>"/appl
- "<update-root>"/files
- "<update-root>"/commands
- "<feedback-root>"

See [How Mirror Works on page 1419](#) for a comprehensive overview of mirroring.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.mirror.appl_path" "path" <b>Values:</b> a valid path up to 255 characters <b>Default:</b> "zebra"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.mirror.path"

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support on page 1239](#).
- For details on SGD command structure, see [Command Structure on page 629](#).

## usb.mirror.reset\_delay

This command specifies a number of seconds for the printer to wait after it loads the last of the files in the **/commands** directory during mirroring.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "usb.mirror.reset_delay" <b>Values:</b> 0 to 900 <b>Default:</b> "5"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "usb.mirror.reset_delay"

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.success

This command returns the last USB mirroring event status string.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "usb.mirror.success" <b>Values:</b> yes (indicates that the mirroring operation was successful) no (indicates that the mirroring operation was not successful)

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## usb.mirror.success\_time

This command returns the date and time of the last successful USB mirroring operation. The date and time reported are from the printer's clock.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "usb.mirror.success_time.fm" <b>Result:</b> 02 18 2015 11:10:09 (mm dd yyyy hh:mm:ss)

### Supported Devices

- ZT410, ZT420
- ZQ510, ZQ520

### Note •

- For printer support, see *SGD Command Support* [on page 1239](#).
- For details on SGD command structure, see *Command Structure* [on page 629](#).

## zbi.control.add\_breakpoint

**Description** This command instructs the printer to set a ZBI program break point. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to set a ZBI program break point. <b>Format:</b> ! U1 setvar "zbi.control.add_breakpoint" "value" <b>Values:</b> Any line number of the program currently being debugged.

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows setting the breakpoint at line "30".

```
! U1 setvar "zbi.control.add_breakpoint" "30"
```

## zbi.control.break

**Description** This command breaks the execution of the ZBI 2.0 program that is currently running. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command breaks the execution of the ZBI program that is currently running. <b>Format:</b> ! U1 setvar "zbi.control.break" "" <b>Values:</b> ""

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "".

```
! U1 setvar "zbi.control.break" ""
```

## zbi.control.clear\_breakpoints

**Description** This command deletes all breakpoints in the current ZBI 2.0 program. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to delete all breakpoints. <b>Format:</b> ! U1 setvar "zbi.control.clear_breakpoints" "" <b>Values:</b> ""

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "".

```
! U1 setvar "zbi.control.clear_breakpoints" ""
```

## **zbi.control.delete\_breakpoint**

**Description** This command deletes a breakpoint in the current ZBI 2.0 program. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to delete the breakpoint at the line indicated by the value parameter. <b>Format:</b> ! U1 setvar "zbi.control.delete_breakpoint" "value" <b>Values:</b> you can use the same value as add_breakpoint.

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the breakpoint set to "30".

```
! U1 setvar "zbi.control.delete_breakpoint" "30"
```

## zbi.control.line\_number

**Description** This command gives you control and information about which line of a stopped ZBI 2.0 program is being executed. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command sets which line of the current ZBI 2.0 program should be executed. <b>Format:</b> ! U1 setvar "zbi.control.line_number" "value" <b>Values:</b> Any line number of the currently stopped ZBI program. <b>Default:</b> "0"
<b>getvar</b>	This command returns the line number that is currently being executed in the ZBI 2.0 program. <b>Format:</b> ! U1 getvar "zbi.control.line_number"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value parameter set to "30".

**! U1 setvar "zbi.control.line\_number" "30"**

When the **setvar** value is set to "30", the **getvar** result is "30".

## zbi.control.restart

This command restarts a ZBI 2.0 program that is currently stopped. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command restarts a ZBI 2.0 program that is currently stopped. <b>Format:</b> ! U1 setvar "zbi.control.restart" "value" <b>Values:</b> ""

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "".

```
! U1 setvar "zbi.control.restart" ""
```

## zbi.control.run

**Description** This command runs the current ZBI 2.0 program that is loaded in the interpreter. For printer support, see *SGD Command Support* on page 1365.

Commands	Details
<b>setvar</b>	This command runs the ZBI 2.0 program that is loaded in the interpreter. <b>Format:</b> ! U1 setvar "zbi.control.run" "" <b>Values:</b> ""

**Note** • For details on SGD command structure, see *Command Structure* on page 611.

**Example:** This **setvar** example shows the value set to "".

```
! U1 setvar "zbi.control.run" ""
```

## zbi.control.step

**Description** This command restarts the execution of the currently stopped ZBI 2.0 program for one line. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the printer to restart the execution of the currently stopped ZBI 2.0 program for one line. <b>Format:</b> ! U1 setvar "zbi.control.step" "" <b>Values:</b> "" <b>Default:</b> ""

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "".

```
! U1 setvar "zbi.control.step" ""
```

When the **setvar** value is set to "".

## zbi.control.terminate

**Description** This command instructs the ZBI 2.0 program to terminate and shuts down the interpreter. For printer support, see *SGD Command Support* on page 1365.

Commands	Details
<b>setvar</b>	This command instructs the ZBI 2.0 program to terminate and shuts down the interpreter. <b>Format:</b> ! U1 setvar "zbi.control.terminate" "value" <b>Values:</b> ""

**Note** • For details on SGD command structure, see *Command Structure* on page 611.

**Example:** This **setvar** example shows the value set to "".

```
! U1 setvar "zbi.control.terminate" ""
```

## **zbi.control.variable\_name**

**Description** This command sets the name of the variable that is to be read or modified through **variable\_value**. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command sets the variable that is to show on the front panel. <b>Format:</b> ! U1 setvar "zbi.control.variable_name" "value" <b>Values:</b> Any ZBI variable in the program that is currently being debugged. <b>Default:</b> ""
<b>getvar</b>	This command retrieves the variable value that is to show on the front panel. <b>Format:</b> ! U1 getvar "zbi.control.variable_name"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "MYVAR\$".

**! U1 setvar "zbi.control.variable\_name" "MYVAR\$"**

When the **setvar** value is set to "MYVAR\$", the **getvar** result is "MYVAR\$".

## zbi.control.variable\_value

**Description** This command identifies the variable name. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command sets a value to the variable referenced by a variable_name. <b>Format:</b> ! U1 setvar "zbi.control.variable_value" "value" <b>Values:</b> A string or integer that is dependent on the variable type in <b>variable_name</b> . <b>Default:</b> The current value of the variable referenced via variable_name
<b>getvar</b>	This command retrieves the variable name that is loaded into the variable_name. <b>Format:</b> ! U1 getvar "zbi.control.variable_value"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "Hello World".

```
! U1 setvar "zbi.control.variable_value" "Hello World"
```

When the **setvar** value is set to "Hello World", the **getvar** result is "Hello World".

## zbi.key

**Description** This command identifies if the ZBI 2.0 option is enabled or disabled on the printer. For printer support, see [SGD Command Support](#) on page 1365.

Commands	Details
getvar	This command retrieves the status of the ZBI 2.0 option on the printer. <b>Format:</b> ! U1 getvar "zbi.key"

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

**Example:** In this example, the **getvar** shows the status of ZBI on the printer.

```
! U1 getvar "zbi.key"  
"ENABLED"
```

## **zbi.last\_error**

**Description** This command identifies the last error that the ZBI 2.0 interpreter encountered. For printer support, see [SGD Command Support](#) on page 1365.

Commands	Details
<b>getvar</b>	This command shows the last error that the ZBI 2.0 interpreter encountered. <b>Format:</b> ! U1 getvar "zbi.last_error"

**Note** • For details on SGD command structure, see [Command Structure](#) on page 611.

**Example:** This example demonstrates how to make the ZBI 2.0 interpreter return the last error it encountered.

```
! U1 getvar "zbi.last_error"
```

## zbi.program\_list

This SGD is intended to be used on WML pages. Its purpose is to support displaying the name of each ZBI program file contained on the E: drive.

**Important** • A specific sequence required to get an accurate listing of files. See the example below.

Type	Details
setvar	<p><b>Format:</b> ! U1 setvar "zbi.program_list" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"fill" = initializes the device (first step)</li> <li>"up" = gets the previous file in the list</li> <li>"down" = gets the next file in the list</li> <li>"execute" = executes the currently specified zbi file (as determined by the <b>getvar</b> command)</li> </ul> <p><b>Default:</b> "none"</p> <p><b>Example:</b> A specific sequence of commands is required to get an accurate listing of files.</p> <ol style="list-style-type: none"> <li>1. Initialize the device by issuing:  <code>! U1 setvar "zbi.program_list" "fill"</code></li> <li>2. To get the first file, issue:  <code>! U1 getvar "zbi.program_list"</code>            This will return the current filename in the list of zbi files present on the E: drive            If the response returned is "none" you have reached the end of the list.</li> <li>3. To get the next filename in the list, issue:  <code>! U1 setvar "zbi.program_list" "up"</code></li> <li>4. To get the previous filename in the list, issue:  <code>! U1 setvar "zbi.program_list" "down"</code></li> <li>5. To execute the current zbi filename, i.e. the one returned by a getvar, issue:  <code>! U1 setvar "zbi.program_list" "execute"</code></li> </ol>
getvar	<b>Format:</b> ! U1 getvar "zbi.program_list"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338, ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

**Note •**

- For device support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zbi.reseller\_key

**Description** This command allows programs that are encrypted with this key in ZBI-Developer to run. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command allows programs that are encrypted with this key in ZBI developer to run. <b>Format:</b> ! U1 setvar "zbi.reseller_key" "value" <b>Values:</b> Any valid encryption key provided by ZBI Developer.

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example shows the value set to "abc123".

```
! U1 setvar "zbi.reseller_key" "abc123".
```

## zbi.revision

**Description** This command identifies the current ZBI version. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the current ZBI version. <b>Format:</b> ! U1 getvar "zbi.revision"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** shows the current ZBI version.

```
! U1 getvar "zbi.revision"
```

## zbi.running\_program\_name

**Description** This command identifies the name of the ZBI 2.0 program that is currently running. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
getvar	This command retrieves the name of the currently running ZBI 2.0 program. <b>Format:</b> ! U1 getvar "zbi.running_program_name"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** command causes the printer to respond that the program **choices.bas** is currently running.

```
! U1 getvar "zbi.running_program_name"  
"CHOICES.BAS"
```

## **zbi.start\_info.execute**

**Description** This command instructs the ZBI 2.0 environment to execute the program listed in the file\_name. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>setvar</b>	This command instructs the ZBI 2.0 environment to execute the program listed in the file_name. <b>Format:</b> ! U1 setvar "zbi.start_info.execute"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** This **setvar** example executes the "choices.bas" program.

```
! U1 setvar "zbi.start_info.execute" "choices.bas"
```

## **zbi.start\_info.file\_name**

**Description** This command prepares a program to run when the **zbi.start\_info.execute** command is used. This command does not run the program. For printer support, see *SGD Command Support* on page 1365.

Commands	Details
<b>setvar</b>	This command is used to prepare a ZBI 2.0 program to be executed using the <b>zbi.start_info.execute</b> command. <b>Format:</b> <code>! U1 setvar "zbi.start_info.file_name" "value"</code> <b>Values:</b> a file name or path of a basic program
<b>getvar</b>	This command is used to return the file path and file name of a ZBI 2.0 program to run using the <b>zbi.start_info.execute</b> command. <b>Format:</b> <code>! U1 getvar "zbi.start_info.file_name"</code> <b>Default:</b> The last program run. If nothing has been run, " <code>*:\.BAZ</code> ".

**Note** • For details on SGD command structure, see *Command Structure* on page 611.

**Example:** This **setvar** example shows the value set to "E:PROGRAM1.BAS".

```
! U1 setvar "zbi.start_info.file_name" "E:PROGRAM1.BAS"
```

When the **setvar** value is set to "E:PROGRAM1.BAS", the **getvar** result is "E:PROGRAM1.BAS".

## **zbi.start\_info.memory\_alloc**

**Description** This command identifies the amount of memory currently in use in a ZBI 2.0 program. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command shows the amount of memory currently in use in bytes. <b>Format:</b> ! U1 getvar "zbi.start_info.memory_alloc"

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** shows the amount of memory currently in use.

```
! U1 getvar "zbi.start_info.memory_alloc"  
"17203"
```

## zbi.state

**Description** This command shows the current state of the ZBI 2.0 program. For printer support, see [SGD Command Support on page 1365](#).

Commands	Details
<b>getvar</b>	This command retrieves the current state of ZBI. <b>Format:</b> ! U1 getvar "zbi.state" <b>Values:</b> "running" = ZBI Interpreter is active and running a program "off" = ZBI Interpreter is inactive "stopped" = ZBI Interpreter is active but not executing a program

**Note** • For details on SGD command structure, see [Command Structure on page 611](#).

**Example:** In this example, the **getvar** shows that state of ZBI.

```
! U1 getvar "zbi.state"  
"running"
```

## zpl.caret

This command is used to change the format command prefix for ZPL commands. The default prefix is the caret (^)

This command is equivalent to the ~CC and ^CC ZPL commands.

Commands	Details
<b>setvar</b>	This command sets the command prefix. <b>Format:</b> ! U1 setvar "zpl.caret" "value" <b>Values:</b> any ASCII character <b>Default:</b> "^"
<b>getvar</b>	This command retrieves the current format command prefix. <b>Format:</b> ! U1 getvar "zpl.caret"

**Example:** This **setvar** example changes the format prefix to a forward slash "/"  
! U1 setvar "zpl.caret" "/"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zpl.control\_character

This command is used to change the control command prefix. The default prefix is the tilde (~).

This command is equivalent to the ^CT and ~CT commands.

Commands	Details
<b>setvar</b>	This command changes the control character. <b>Format:</b> ! U1 setvar "zpl.control_character" "value" <b>Values:</b> ASCII values for the desired character "00-FF,00-ff,up,down" See <a href="#">ASCII Code Chart on page 1308</a> . <b>Default:</b> "7E" (tilde)
<b>getvar</b>	This command returns the currently set control character. <b>Format:</b> ! U1 getvar "zpl.control_character"

**Example:** This example sets the value set to "+".

```
! U1 setvar "zpl.control_character" "2b"
```

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## zpl.delimiter

This command is used to change the delimiter character for ZPL commands. The default delimiter character is the comma (,).

Related Commands: ^CD and ~CD commands.

Commands	Details
<b>setvar</b>	This command changes the delimiter character for ZPL commands. <b>Format:</b> ! U1 setvar "zpl.delimiter" "value" <b>Values:</b> HEX values for the desired character "00-FF,00-ff,up,down" See <a href="#">ASCII Code Chart on page 1308</a> . <b>Default:</b> "2C" (comma)
<b>getvar</b>	This command returns the currently set delimiter character. <b>Format:</b> ! U1 getvar "zpl.delimiter"

**Example:** This example changes the delimiter to a semi-colon (;).

```
! U1 setvar "zpl.delimiter" "3B"
```

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## zpl.label\_length

This command defines the length of the label. This command is necessary when using continuous media (media that is not divided into separate labels by gaps, spaces, notches, slots, or holes).

This command is equivalent to the ^LL command.

Commands	Details
<b>setvar</b>	<p>This command sets the label length.</p> <p><b>Format:</b> ! U1 setvar "zpl.label_length" "value"</p> <p><b>Values:</b> 1 to 32000, (in dots) not to exceed the maximum label length.</p> <p>While the printer accepts any value for this parameter, the amount of memory installed determines the maximum length of the label.</p>
<b>getvar</b>	<p>This command returns the current label length setting.</p> <p><b>Format:</b> ! U1 getvar "zpl.label_length"</p>

**Comments** These formulas can be used to determine the value of y:

**For 6 dot/mm printheads...** Label length in inches x 152.4 (dots/inch) = y

**For 8 dot/mm printheads...** Label length in inches x 203.2 (dots/inch) = y

**For 12 dot/mm printheads...** Label length in inches x 304.8 (dots/inch) = y

**For 24 dot/mm printheads...** Label length in inches x 609.6 (dots/inch) = y

Values for y depend on the memory size. If the entered value for y exceeds the acceptable limits, the bottom of the label is cut off. The label also shifts down from top to bottom.

**Example:**

```
! U1 setvar zpl.label_length" "1281"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zpl.left\_position

This command sets the label's left margin offset in dots.

Related Command: ^LS

Commands	Details
<b>setvar</b>	This command sets the label left margin offset in dots. <b>Format:</b> ! U1 setvar "zpl.left_position" "value" <b>Values:</b> "-9999 to 9999" <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the currently set left margin offset for the label. <b>Format:</b> ! U1 getvar "zpl.left_position"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Example:

```
! U1 setvar "zpl.left_position" "100"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zpl.system\_error

This command returns the system error flags.

This command is equivalent to the error recording of ~HQES

Commands	Details
<b>getvar</b>	<p>This command returns the state of the system error flags..</p> <p><b>Format:</b> ! U1 getvar "zpl.system_error"</p> <p><b>Result:</b> 0,0,00000000,00000000 (flag, error flag, Group 2, Group 1)</p>

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

**Example 1:** This example shows how to request the printer's status.

To request the printer's status, type ! U1 getvar "zpl.system\_error"

The printer responds with data similar to this: "1,1,00000000,00000004"

In this example, the Printer Status resolves to these conditions:

- The printer is in Pause (value = 1)
- The Error Flag is 0 if there are no errors (i.e. Group 2 and Group 1 are all 0s), and 1 if there are any errors.
- The cover/printhead is open (value = 4).

Table 28 • Error Flags (~HQES)

Error Flags	Flag	Group 2		Group 1 (X = Value can be any hexadecimal number [0-9, A-F])							
		Nibbles16-9	Nibble 8	Nibble 7	Nibble 6	Nibble 5	Nibble 4	Nibble 3	Nibble 2	Nibble 1	
No Error	0	00000000	0	0	0	0	0	0	0	0	0

Paused <sup>aq</sup>	1 <sup>aq</sup>	00000000	X	X	X	1 <sup>aq</sup>	X	X	X	X	

<sup>aq</sup>This error flag is supported only on KR403 printers.

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zpl.system\_status

This command returns the errors and warnings of the system.

This command is equivalent to all data reported by the ~HQES ZPL command.

Commands	Details
getvar	<p>This command returns the system error and warning flags.</p> <p><b>Format:</b> ! U1 getvar "zpl.system_status"</p> <p><b>Result:</b> 0,0,0000000,0000000,0,0000000,0000000          (flag, error flag, group 2, group 1, warning flag, group 2, group 1)</p>

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

**Example 1:** This example shows how to request the printer's status.

a. To request the printer's status, type ! U1 getvar "zpl.system\_status"

The printer responds with data similar to this:

"1,1,0000000,0000004,0,0000000,0000000"

In this example, the Printer Status resolves to these conditions:

- The printer is in Pause (value = 1)
- The Error Flag is 0 if there are no errors (i.e. Group 2 and Group 1 are all 0s), and 1 if there are any errors (non-zero).
- The cover/printhead is open (value = 4).
- The Warning Flag is 0 if there are no warnings (i.e. Group 2 and Group 1 are all 0s), and 1 if there are any errors (non-zero).

**Table 29 • Error Flags (~HQES)**

Error Flags	Flag	Group 2	Group 1 (X = Value can be any hexadecimal number [0-9, A-F])								
		Nibbles16-9	Nibble 8	Nibble 7	Nibble 6	Nibble 5	Nibble 4	Nibble 3	Nibble 2	Nibble 1	
No Error	0	00000000	0	0	0	0	0	0	0	0	0

Sensor 8 (at bin) <sup>as</sup>	1 <sup>as</sup>	00000000	X	X	X	X	X	8 <sup>as</sup>	X	X

as. This error flag is supported only on KR403 printers.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zpl.zpl\_mode

This command sets the ZPL mode to ZPL II or ZPL.

Commands	Details
<b>setvar</b>	<p>This command sets the printer ZPL mode.</p> <p><b>Format:</b> ! U1 setvar "zpl.zpl_mode" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"zpl"</li> <li>"zpl II"</li> </ul> <p><b>Default:</b> "zpl II"</p>
<b>getvar</b>	<p>This command returns the current ZPL mode setting.</p> <p><b>Format:</b> ! U1 getvar "zpl.zpl_mode"</p>

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

**Example:** This **setvar** example sets the ZPL mode to ZPL.

```
! U1 setvar "zpl.system_status" "zpl"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zpl.zpl\_override

Enable this menu item to prevent the following ZPL commands from changing the printer's current settings:

- ^MM (print mode)
- ^MT (Direct Thermal or Thermal Transfer print method)
- ^MN (media type - non-continuous or continuous)

When this menu item is disabled, these commands override the printer's settings.

Commands	Details
<b>setvar</b>	<p>Sets the override status to the specified value.</p> <p><b>Format:</b> ! U1 setvar "zpl.zpl_override" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"disabled" = allows override</li> <li>"enabled" = prevents ZPL commands from overriding printer settings.</li> </ul> <p><b>Default:</b> "disabled"</p>
<b>getvar</b>	<p>Returns the current override status.</p> <p><b>Format:</b> ! U1 getvar "zpl.zpl_override"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"disabled"</li> <li>"enabled"</li> </ul>

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

**Example:** This example enables **zpl.zpl\_override**, which prevents ^MM, ^MT, and ^MN from making changes to the current printer settings.

```
! U1 setvar "zpl.zpl_override" "enabled"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## zpl.relative\_darkness

Changes the relative darkness for ZPL labels. This command is similar to the ZPL ^MD command.

**Important** • This value is saved permanently on Desktop printers, but it is not saved permanently on Industrial or Mobile.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "zpl.relative_darkness" "value" <b>Values:</b> "" to "300" <b>Default:</b> "0"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "relative_darkness"

**Example:** These examples show setting the printer to different darkness levels:

- If the current value shown on the configuration label is "16", using a **zpl.relative\_darkness** command of "-90" decreases the value to "7.0".
- If the current value shown on the configuration label is "1", using a **zpl.relative\_darkness** command of "153" increases the value to "16.3".
- If the current value shown on the configuration label is "25", using a **zpl.relative\_darkness** command of "105" increases the value to "30.0", which is the maximum value allowed.

Each **zpl.relative\_darkness** command is treated separately in relation to the current value as printed on the configuration label.

### Supported Devices

- iMZ 220, iMZ 320
- QLn220, QLn320, QLn420
- ZQ510, ZQ520
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# SGD Wired Commands

This chapter provides a high-level overview of the wired Set / Get / Do (SGD) commands. For printer support of these SGD commands, see [SGD Command Support on page 1365](#).

.15↑

SGD commands are available in printers with the following firmware versions or later:

- V54
- V66
- V68
- V72
- V73
- V74
- V75
- V76
- V78
- V79
- V60.16.2Z or later
- V60.15.xZ or later
- V50.15.xZ or later
- V61.15.xZ or later
- V56.15.xZ or later
- V53.16.x or later
- V53.15.2Z or later
- R53.16.3Z or later
- R60.15.8Z or later
- R62.15.8Z or later
- R63.15.8Z or later
- R65.15.8Z or later

**Important** • These are important points to note when using ZPL and SGD commands:

- SGD commands are case-sensitive.
- ZPL and SGD commands should be sent to the printer as separate files.
- Certain settings can be controlled by both ZPL and SGD. Configuration changes made in ZPL can affect configuration changes made in SGD.
- Changes made with one command type (ZPL or SGD) will affect the data returned to the host in response to both ZPL and getvar commands. The command type (ZPL or SGD) that was sent last determines the current setting.
- Some RF cards do not support all of the SGD commands.

**Important** • These are important points to note when using a Zebra G-Series printer:

- You can send instructions to the printer using multiple programming languages: EPL, ZPL, or SGD. EPL and ZPL commands configure the printer, print labels, and get device status information. SGD commands set and get configuration details. These three languages can be used without the need to send the printer instructions to switch from one language to another.
- EPL, ZPL, and SGD commands must be sent to the printer as separate files. They cannot be used together in one format, or set of commands. For example, if you send a series of SGD commands to the printer and they are followed by a printable format, this needs to be done using separate files.

## Overview

This section describes how and why to use the Set / Get / Do (SGD) commands. It also provides an example of a typical command structure.

**Note** • SGD commands must be terminated by a carriage return or a space and line feed.

SGD commands are commands that allow you to configure all printers with firmware version V60.15.x, V50.15.x, V61.15.x, V56.15.x, V53.15.xZ, or later. The printer performs the specified function immediately after receiving the command. The commands are:

- **setvar**
- **getvar**
- **do**

### setvar Command

**Setvar** commands:

- are used to configure printer settings to specific values by setting them in the printer
- must be terminated by a space character or a CR/ LF (0x0D, 0x0A)

**Important** • The setvar command and attributes must be specified in lower case.

### getvar Command

**Getvar** commands:

- are used to get the current value of the printer settings
- must be terminated by a space character or CR/LF (0x0D, 0x0A)

The printer responds with the printer setting of "?" if:

- the printer setting does not exist (usually due to incorrect spelling of the printer setting)
- it has not been configured yet

**Important** • The printer settings and attributes must be specified in lower case.

### do Command

**Do** commands:

- are used to instruct the printer to perform predefined actions
- must be terminated by a space character or a CR/LF (0x0D, 0x0A)

Some **Do** commands require additional settings which must be enclosed in double quotes.

**Important** • The values must be specified in lower case.

## Command Structure

It is important to understand the structure of the command and its components. A command structure illustration is provided for each command in this guide.

**Example:** This is an example of a command structure illustration:

<b>1</b>	Command—always preceded with an exclamation point (!) and must be specified in lower case. A space resides between the ! and <b>U1</b> and between <b>U1</b> and the command ( <b>setvar</b> or <b>getvar</b> ).
<b>2</b>	Attribute—always in double quotes and must be specified in lower case.
<b>3</b>	Chosen value—always in double quotes. Only applicable for <b>setvar</b> and <b>do</b> .

This command must be terminated by a space character or a CR/ LF (0x0D, 0x0A).

## How to Send Multiple SGD Commands

For any **getvar**, **setvar**, or **do** command, if you issue the syntax without the "1" and use the END command followed by a space, multiple SGD commands are sent simultaneously.

**Example:** This syntax shows how you can send multiple **getvar** commands:

```

1 -----> ! U getvar "ip.telnet.enable"
2 -----> getvar "ip.dhcp.enable"
3 -----> getvar "ip.dhcp.cid_prefix"
      -----> END
  
```

<b>1</b>	The command portion of the string does not use the "1" after the "! U".
<b>2</b>	Commands issued after the first command do not require the "! U".
<b>3</b>	The string of commands is terminated by the word "END" with a space after the word, and by a carriage return/ line feed.

## external\_wired.check

This command controls whether to check for external print server during the network interface search.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the network interface search.</p> <p><b>Format:</b> ! U1 setvar "external_wired.check" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"on" = turn on external wired network interface search</li><li>"off" = turn off external wired network interface search</li></ul> <p><b>Default:</b></p> <ul style="list-style-type: none"><li>"on" = If wireless option board is not installed</li><li>"off" = If wireless option board is installed</li></ul>
<b>getvar</b>	<p>This command retrieves the status of the network interface search.</p> <p><b>Format:</b> ! U1 getvar "external_wired.check"</p>

**Example:** This **setvar** example shows the value set to "off".

**! U1 setvar "external\_wired.check" "off"**

When the **setvar** value is set to "off", the **getvar** result is "off".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.addr

This command allows you to get or set the external wired print servers's IP address.

**Important** • For a set IP address to take affect, the IP protocol must be set to permanent and the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change its current external wired print server IP address upon powering the printer on.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.addr" "value"</p> <p><b>Values:</b> any valid IP address</p> <p><b>Default:</b> "0.0.0.0"</p>
<b>getvar *</b>	<p>This command instructs the printer to respond with its current external wired print server IP address.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.addr"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Note** • The **setvar** value of this command can be affected by the **external\_wired.ip.dhcp.enable** command.

**Example:** This **setvar** example shows the value set to "10.14.4.235".

```
! U1 setvar "external_wired.ip.addr" "10.14.4.235"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "10.14.4.235".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.arp\_interval

This print server setting allows you to specify the ARP (Address Resolution Protocol) interval or the ARP cache time out for the external wired print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the ARP interval or the ARP cache time out for the external wired print server. <b>Format:</b> ! U1 setvar "external_wired.ip.arp_interval" "value" <b>Values:</b> 0 - 30 <b>Default:</b> "0"
<b>getvar *</b>	This command instructs the printer to respond with the ARP interval or the ARP cache time out value for the external wired print server. <b>Format:</b> ! U1 getvar "external_wired.ip.arp_interval"

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "external_wired.ip.arp_interval" "0"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "0".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.default\_addr\_enable

This command allows you to default the external wired print server's IP address.

**Important** • For a set IP address to take affect, the IP protocol must be set to permanent and the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command tells the printer to use it's default address, if no address is provided through DHCP or BOOTP. If you do not assign an IP address after 2 minutes, the 10/100 Internal PS defaults to IP address 192.168.254.254.</p> <p><b>Format:</b>  <code>! U1 setvar "external_wired.ip.default_addr_enable" "value"</code></p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on" = enabled</li> <li>"off" = disabled</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar *</b>	<p>This command instructs the printer to show the status of the setting of external wired print server's default IP address feature.</p> <p><b>Format:</b> <code>! U1 getvar "external_wired.ip.default_addr_enable"</code></p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "external_wired.ip.default_addr_enable" "on"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "on".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.dhcp.cid\_all

This printer setting defines the entire client identifier (DHCP option 61) if DHCP is enabled on the external print server and "external\_wired.ip.dhcp.cid\_type" is set to "0", or "2". The MAC address is used if the type is set to "1".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the client identifier prefix and suffix of the external wired print server. The prefix gets cleared and the suffix contains the entire client identifier.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.dhcp.cid_all" "value"</p> <p><b>Values:</b> A maximum length of 60 characters if the CID type is ASCII, or 120 characters if the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar *</b>	<p>This command instructs the printer to respond with the client identifier prefix and suffix of the external wired print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.dhcp.cid_all"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "printer".

```
! U1 setvar "external_wired.ip.dhcp.cid_all" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.dhcp.cid\_enable

This command determines if DHCP (option 61) on the external wired print server is turned on or off.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the status of the client identifier of the external wired print server.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.dhcp.cid_enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = client identifier is turned off</li> <li>"on" = client identifier is turned on</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar *</b>	<p>This command instructs the printer to respond with the status of the client identifier of the external wired print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.dhcp.cid_enable"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "external_wired.ip.dhcp.cid_enable" "off"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "off".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.dhcp.cid\_prefix

This printer setting defines the prefix to be prepended to the DHCP client identifier (option 61) when DHCP is enabled on the external wired print server and "external\_wired.ip.dhcp.cid\_type" is set to "0" or "2".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the CID prefix of the external wired print server.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.dhcp.cid_prefix" "value"</p> <p><b>Values:</b> Any text string up to 10 characters if the CID type is ASCII, or 20 characters if the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar *</b>	<p>This command instructs the printer to respond with the client identifier prefix of the external wired print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.dhcp.cid_prefix"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "PRT001".

```
! U1 setvar "external_wired.ip.dhcp.cid_prefix" "PRT001"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "PRT001".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.dhcp.cid\_suffix

This printer setting defines the unique suffix to be used as the client identifier (DHCP option 61) if DHCP is enabled repeated on the external wired print server and [external\\_wired.ip.dhcp.cid\\_type](#) on page 992 is set to "0" or "2", not "1".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the client identifier suffix value.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.dhcp.cid_suffix" "value"</p> <p><b>Values:</b> The maximum length of a value allowed is 60 ASCII characters when the CID type is ASCII, or 120 hexadecimal values when the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar *</b>	<p>This command instructs the printer to respond with the client identifier suffix on the external wired print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.dhcp.cid_suffix"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows setting the suffix to "printer".

```
! U1 setvar "external_wired.ip.dhcp.cid_suffix" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.dhcp.cid\_type

This printer setting defines the type of client identifier (DHCP option 61) that will be sent if DHCP is enabled on the external wired print server. A value of "1" means the type of "Ethernet" and the printer's MAC address will be used. A value of "0" or "2" means the client identifier sent will be "external\_wired.ip.dhcp.cid\_prefix" concatenated with "external\_wired.ip.dhcp.cid\_suffix".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to enable "synthetic" Client Identifier for the external wired print server.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.dhcp.cid_type" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"0" = ASCII string</li><li>"1" = wired print server's MAC address</li><li>"2" = HEX value</li></ul> <p><b>Default:</b> "1"</p>
<b>getvar *</b>	<p>This command instructs the printer to respond with the client identifier type for the external wired print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.dhcp.cid_type"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "1".

```
! U1 setvar "external_wired.ip.dhcp.cid_type" "1"
```

When the **setvar** value is set to "1", the **getvar** result is "1".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.gateway

This command instructs the printer to change the external wired print server's gateway address.

**Important** • This setting refers to the gateway address. A set value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the external wired printer server's gateway address.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.gateway" "value"</p> <p><b>Values:</b> Any valid gateway address</p> <p><b>Default:</b> "0.0.0.0"</p>
<b>getvar *</b>	<p>This command instructs the printer to respond with the external wired printer server's gateway address.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.gateway"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "10.3.5.1".

```
! U1 setvar "external_wired.ip.gateway" "10.3.5.1"
```

When the **setvar** value is set to "10.3.5.1", the **getvar** result is "10.3.5.1".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.netmask

This setting refers to the external wired print server's subnet mask address. This value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the external wired print servers's subnet mask. <b>Format:</b> <code>! U1 setvar "external_wired.ip.netmask" "value"</code> <b>Values:</b> Any valid subnet mask. <b>Default:</b> <code>"255.255.255.0"</code>
<b>getvar *</b>	This command instructs the printer to respond with the external wired print server's subnet mask. <b>Format:</b> <code>! U1 getvar "external_wired.ip.netmask"</code>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to `"255.255.255.0"`.

```
! U1 setvar "external_wired.ip.netmask" "255.255.255.0"
```

When the **setvar** value is set to `"255.255.255.0"`, the **getvar** result is `"255.255.255.0"`.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.port

This printer setting refers to the external wired print server's port number that the TCP print service is listening on. Normal TCP communications from the host should be directed to this port.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the external wired print server's TCP/UDP port number. <b>Format:</b> ! U1 setvar "external_wired.ip.port" "value" <b>Values:</b> 1 - 65535 (excluding any ports currently used by other services, such as 21, 23, 80, and 515). <b>Default:</b> "9100"
<b>getvar *</b>	This command instructs the printer to respond with the external wired printer server's TCP/UDP port number. <b>Format:</b> ! U1 getvar "external_wired.ip.port"

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "9100".

```
! U1 setvar "external_wired.ip.port" "9100"
```

When the **setvar** value is set to "9100", the **getvar** result is "9100".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.protocol

This command configures the IP addressing method used by the external wired print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to configure the IP addressing method used by the external wired print server.</p> <p><b>Format:</b> ! U1 setvar "external_wired.ip.protocol" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"bootp" = uses the standard bootp addressing method to obtain an IP address and configuration</li> <li>"dhcp" = uses the standard dhcp addressing method to obtain an IP address and configuration for a server specified period of time</li> <li>"rarp" = uses the standard rarp addressing method to obtain an IP address</li> <li>"glean" = uses the IP address from a PING packet that is sent to its hardware address (unicast address)</li> <li>"permanent" = uses static values assigned through other commands</li> <li>"all" = tries all of the dynamic addressing methods, not permanent, to obtain an IP address</li> </ul> <p><b>Default:</b> "all"</p>
<b>getvar *</b>	<p>This command returns the IP addressing method used by the external print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.protocol"</p>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** In this example, the **setvar** result is the current programming language that the printer is using.

```
! U1 setvar "external_wired.ip.protocol" "bootp"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "bootp".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.timeout.enable

This network setting refers to enabling the connection timeout on the external wired 10/100 print server. For this to take effect, the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to enable or disable the timeout checking on the external wired print server.</p> <p><b>Format:</b></p> <pre>! U1 setvar "external_wired.ip.timeout.enable" "value"</pre> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"<b>off</b>" = turns off the connection checking</li> <li>"<b>on</b>" = turns on the connection checking</li> </ul> <p><b>Default:</b> "<b>on</b>"</p>
<b>getvar *</b>	<p>This command instructs the printer to return whether the timeout checking is enabled on the external wired print server.</p> <p><b>Format:</b></p> <pre>! U1 getvar "external_wired.ip.timeout.enable"</pre>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "**on**".

```
! U1 setvar "external_wired.ip.timeout.enable" "on"
```

When the **setvar** value is set to "**on**", the **getvar** result is "**on**".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.timeout.value

This network setting refers to the number of seconds before the connection times out for the external wired print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the time of the external wired print server, in seconds, before the connection times out. <b>Format:</b> <code>! U1 setvar "external_wired.ip.timeout.value" "value"</code> <b>Values:</b> "1" through "3600" <b>Default:</b> "300"
<b>getvar *</b>	This command instructs the printer to respond with the time of the external wired print server, in seconds, before the connection times out. <b>Format:</b> <code>! U1 getvar "external_wired.ip.timeout.value"</code>

\* On SEH print server models PS102-Z or the PS105-Z, only the getvar command is supported.

**Example:** This **setvar** example shows the value set to "300".

```
! U1 setvar "external_wired.ip.timeout.value" "300"
```

When the **setvar** value is set to "300", the **getvar** result is "300".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.v6.addr

This command retrieves the IPv6 address of the SEH wired print server. This command is only supported on SEH print server models PS105-Z and PS102-Z with firmware version V60.16.5Z or V53.16.5Z and later.

Commands	Details
<b>getvar</b>	<p>This command retrieves the IPv6 address of the SEH wired print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.v6.addr"</p> <p><b>Values:</b></p> <p>8 group of four hexadecimal digits with a colon delimiter character set = A-F or 0-9 (39-character maximum)</p>

### Supported Devices

- SEH print server model PS105-Z with firmware version V60.16.5Z or V53.16.5Z and later.
- SEH print server model PS102-Z with firmware version V60.16.5Z or V53.16.5Z and later.

**Example:** In this example, the **getvar** returns the IPv6 address of the wired print server.

```
! U1 getvar "external_wired.ip.v6.addr"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.v6.gateway

This command retrieves the IPv6 gateway of the SEH wired print server.

Commands	Details
getvar	<p>This command retrieves the IPv6 gateway of the SEH wired print server.</p> <p><b>Format:</b> ! U1 getvar "external_wired.ip.v6.gateway"</p> <p><b>Values:</b></p> <p>8 group of four hexadecimal digits with a colon delimiter character set = A-F or 0-9 (39-character maximum)</p>

### Supported Devices

- SEH print server model PS105-Z with firmware version V60.16.5Z or V53.16.5Z and later.
- SEH print server model PS102-Z with firmware version V60.16.5Z or V53.16.5Z and later.

**Example:** In this example, the **getvar** returns the IPv6 gateway of the wired print server.

```
! U1 getvar "external_wired.ip.v6.gateway"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.ip.v6.prefix\_length

This command retrieves the IPv6 address prefix length of the SEH wired print server.

Commands	Details
<b>getvar</b>	This command retrieves the IPv6 address prefix length of the SEH wired print server. <b>Format:</b> ! U1 getvar "external_wired.ip.v6.prefix_length" <b>Values:</b> character set = 0-9 (3-character maximum)

### Supported Devices

- SEH print server model PS105-Z with firmware version V60.16.5Z or V53.16.5Z and later.
- SEH print server model PS102-Z with firmware version V60.16.5Z or V53.16.5Z and later.

**Example:** In this example, the **getvar** returns the IPv6 address prefix length of the wired print server.

```
! U1 getvar "external_wired.ip.v6.prefix_length"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.mac\_addr

This command retrieves the MAC address of the external wired print server.

Commands	Details
getvar	This command instructs the printer to respond with the MAC address of the external wired print server. <b>Format:</b> ! U1 getvar "external_wired.mac_addr"

**Example:** In this example, the **getvar** result is the MAC address of the external wired print server.

```
! U1 getvar "external_wired.mac_addr"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## external\_wired.mac\_raw

This command specifies the RAW MAC address of the external print server. The raw mac address is the mac address without the colons (":").

Commands	Details
<b>getvar</b>	This command retrieves the RAW MAC address of the external print server. <b>Format:</b> ! U1 getvar "external_wired.mac_raw"

**Example:** In this example, the **getvar** retrieves the RAW MAC address of the external print server.

```
! U1 getvar "external_wired.mac_raw"
```

```
"00074d2408ff"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.activity\_led

Controls whether the Ethernet activity LED will blink or be solid when there is link.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "internal_wired.activity_led" "value" <b>Values:</b> "blink" = the LED will blink "solid" = the LED will be solid <b>Default:</b> "blink"
getvar	<b>Format:</b> ! U1 getvar "internal_wired.activity_led"

### Supported Devices

- QLn220, QLn420, QLn320
- ZR628, ZR638

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.auto\_switchover

This command instructs the printer to switch from wireless to the internal wired print server when an Ethernet cable is plugged into the printer and the printer detects an active data link.

Commands	Details
<b>setvar</b>	<p>This command configures switches between the wireless and wired interfaces.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.auto_switchover" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on" = switchover enabled</li> <li>"off" = switchover disabled</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command retrieves the current automatic switchover value.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.auto_switchover"</p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

### Important • For this command to work, be sure:

- you are using a ZM400/ZM600 or RZ400/RZ600 printer with both the internal 10/100 wired print server and wireless option board installed
- the value for this command is set to "on" (switchover enabled)
- the printer is currently communicating to the network through a wireless connection
- a Ethernet cable is plugged into the ZM400/ZM600 or RZ400/RZ600 printer and the printer recognizes a data link connection

When the above conditions exist and an active Ethernet cable is plugged into an internal wired print server, the printer will detect the wired data link and automatically switch to the wired interface. The printer will automatically switch back to the wireless interface when the Ethernet cable is disconnected.

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "internal_wired.auto_switchover" "off"
```

When the **setvar** value is set to "off", the **getvar** result is "off".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.installed

Returns if the wired option is installed in the printer.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "internal_wired.installed" <b>Values:</b> "yes" = the wired print server is installed "no" = the wired print server is not installed

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## internal\_wired.ip.addr

This command allows you to get or set the internal wired print servers's IP address.

**Important** • For a set IP address to take affect, the IP protocol must be set to permanent and the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change its current internal wired print server IP address upon powering the printer on.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.addr" "value"</p> <p><b>Values:</b> any valid IP address</p> <p><b>Default:</b> "0.0.0.0"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with its current internal wired print server IP address.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.addr"</p>

**Note** • The **setvar** value of this command can be affected by the **internal\_wired.ip.dhcp.enable** command.

**Example:** This **setvar** example shows the value set to "10.14.4.235".

```
! U1 setvar "internal_wired.ip.addr" "10.14.4.235"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "10.14.4.235".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.arp\_interval

This print server setting allows you to specify the ARP (Address Resolution Protocol) interval or the ARP cache time out for the internal wired print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the ARP interval or the ARP cache time out for the internal wired print server. <b>Format:</b> ! U1 setvar "internal_wired.ip.arp_interval" "value" <b>Values:</b> 0 - 30 <b>Default:</b> "0"
<b>getvar</b>	This command instructs the printer to respond with the ARP interval or the ARP cache time out value for the internal wired print server. <b>Format:</b> ! U1 getvar "internal_wired.ip.arp_interval"

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "internal_wired.ip.arp_interval" "0"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "0".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## internal\_wired.ip.default\_addr\_enable

This command allows you to default the internal wired print server's IP address.

**Important** • For a set IP address to take affect, the IP protocol must be set to permanent and the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command tells the printer to use it's default address, if no address is provided through DHCP or BOOTP. If you do not assign an IP address after 2 minutes, the 10/100 Internal PS defaults to IP address 192.168.254.254.</p> <p><b>Format:</b>  <b>! U1 setvar "internal_wired.ip.default_addr_enable" "value"</b></p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on" = enabled</li> <li>"off" = disabled</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to show the status of the setting of internal wired print server's default IP address feature.</p> <p><b>Format:</b> <b>! U1 getvar "internal_wired.ip.default_addr_enable"</b></p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "internal_wired.ip.default_addr_enable" "on"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "on".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.arp\_verify

This command controls whether the internal wired print server will send an ARP response after receiving an IP address via DHCP.

Commands	Details
<b>setvar</b>	<p><b>Format:</b> ! U1 setvar "internal_wired.ip.dhcp.arp_verify" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = ARP response will not be sent.</li> <li>"on" = ARP response will be sent.</li> </ul> <p><b>Default:</b></p> <ul style="list-style-type: none"> <li>"off" for mobile Link-OS printers</li> <li>"on" for desktop and industrial printers</li> </ul>
<b>getvar</b>	<b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.arp_verify"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.cache\_ip

This command enables or disables the IP cache on the internal wired print server.

Commands	Details
<b>setvar</b>	<p>This command sets the status of the IP cache.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.dhcp.cache_ip" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on" = enabled</li> <li>"off" = disabled</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command retrieves the status of the IP cache on the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.cache_ip"</p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "internal_wired.ip.dhcp.cache_ip" "off"
```

When the **setvar** value is set to "off", the **getvar** result is "off".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.cid\_all

This printer setting defines the entire client identifier (DHCP option 61) if DHCP is enabled on the internal print server and "internal\_wired.ip.dhcp.cid\_type" is set to "0", or "2". The MAC address is used if the type is set to "1".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the client identifier prefix and suffix of the internal wired print server. The prefix gets cleared and the suffix contains the entire client identifier.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.dhcp.cid_all" "value"</p> <p><b>Values:</b> A maximum length of 60 characters if the CID type is ASCII, or 120 characters if the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier prefix and suffix of the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.cid_all"</p>

**Example:** This **setvar** example shows the value set to "printer".

```
! U1 setvar "internal_wired.ip.dhcp.cid_all" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.cid\_enable

This command determines if DHCP (option 61) is turned on or off of the internal wired print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the status of the client identifier of the internal wired print server.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.dhcp.cid_enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = client identifier is turned off</li> <li>"on" = client identifier is turned on</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the status of the client identifier of the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.cid_enable"</p>

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "internal_wired.ip.dhcp.cid_enable" "off"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "off".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.cid\_prefix

This printer setting defines the prefix to be prepended to the DHCP client identifier (option 61) when DHCP is enabled on the internal wired print server and "internal\_wired.ip.dhcp.cid\_type" is set to "0" or "2".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the CID prefix of the internal wired print server.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.dhcp.cid_prefix" "value"</p> <p><b>Values:</b> Any text string up to 10 characters if the CID type is ASCII, or 20 characters if the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier prefix of the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.cid_prefix"</p>

**Example:** This **setvar** example shows the value set to "PRT001".

```
! U1 setvar "internal_wired.ip.dhcp.cid_prefix" "PRT001"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "PRT001".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.cid\_suffix

This printer setting defines the unique suffix to be used as the client identifier (DHCP option 61) if DHCP is enabled on the internal wired 10/100 print server and "internal\_wired.ip.dhcp.cid\_type" is set to "0" or "2".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the client identifier suffix value of the internal wired 10/100 print server.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.dhcp.cid_suffix" "value"</p> <p><b>Values:</b> The maximum length of a value allowed is 60 ASCII characters when the CID type is ASCII, or 120 hexadecimal values when the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier suffix of the internal wired 10/100 print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.cid_suffix"</p>

**Example:** This **setvar** example shows the value set to "printer".

```
! U1 setvar "internal_wired.ip.dhcp.cid_suffix" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.cid\_type

This printer setting defines the type of client identifier (DHCP option 61) that will be sent if DHCP is enabled on the internal wired print server. A value of "1" means the type of "Ethernet" and the printer's MAC address will be used. A value of "0" or "2" means the client identifier sent will be "internal\_wired.ip.dhcp.cid\_prefix" concatenated with "internal\_wired.ip.dhcp.cid\_suffix".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to enable "synthetic" Client Identifier for the internal wired print server.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.dhcp.cid_type" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"0" = ASCII string</li> <li>"1" = wired print server's MAC address</li> <li>"2" = HEX value</li> </ul> <p><b>Default:</b> "1"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier type for the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.cid_type"</p>

**Example:** This **setvar** example shows the value set to "1".

```
! U1 setvar "internal_wired.ip.dhcp.cid_type" "1"
```

When the **setvar** value is set to "1", the **getvar** result is "1".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.lease.last\_attempt

This command retrieves the last time a DHCP request was sent from the internal wired print server.

Commands	Details
<b>getvar</b>	<p>This command retrieves the last time a DHCP request was sent from the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.lease.last_attempt"</p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** In this example, the **getvar** retrieves the last time a DHCP request was sent to the internal wired print server.

```
! U1 getvar "internal_wired.ip.dhcp.lease.last_attempt"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.lease.length

This command retrieves the original length (in seconds) of the DHCP lease on the internal wired print server.

Commands	Details
<b>getvar</b>	<p>This command retrieves the original length (in seconds) of the DHCP lease on the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.lease.length"</p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** In this example, the **getvar** returns the original length of the DHCP lease on the internal wired print server.

```
! U1 getvar "internal_wired.ip.dhcp.lease.length"
```

```
"691200"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.lease.server

This command retrieves the address of the server that provided the DHCP lease on the internal wired print server.

Commands	Details
<b>getvar</b>	<p>This command retrieves the address of the server that provided the DHCP lease on the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.lease.server"</p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

→ **Example:** In this example, the **getvar** retrieves the address of the server that provided the DHCP lease on the internal wired print server.

```
! U1 getvar "internal_wired.ip.dhcp.lease.server"
```

```
"10.3.1.98"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.lease.time\_left

This command retrieves the time (in seconds) left in the current DHCP lease on the internal wired print server.

Commands	Details
<b>getvar</b>	This command retrieves the time (in seconds) left in the current DHCP lease on the internal wired print server. <b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.lease.time_left"

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** In this example, the **getvar** retrieves the time left in the current DHCP lease on the wired internal print server.

```
! U1 getvar "internal_wired.ip.dhcp.lease.time_left"
```

```
"10.3.1.98"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.option12

This command specifies if the DHCP option 12 (host name) is on or off in the discovery packet that is sent from the internal wired print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the DHCP option 12 (host name) in the discovery packet of the internal wired print server.</p> <p><b>Format:</b>  <b>! U1 setvar "internal_wired.ip.dhcp.option12" "value"</b></p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"<b>on</b>" = turns on option 12</li> <li>"<b>off</b>" = turns off option 12</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command retrieves the status of the DHCP option 12 (host name) in the discovery packet of the internal wired print server.</p> <p><b>Format:</b>  <b>! U1 getvar "internal_wired.ip.dhcp.option12"</b></p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "internal_wired.ip.dhcp.option12" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.option12\_format

This command specifies the value which will be used for option 12 (host name) to be used in the DHCP discovery packet of the internal wired print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set value which will be used for option 12 (host name) to be used in the DHCP discovery packet of the internal wired print server.</p> <p><b>Format:</b></p> <pre>! U1 setvar "internal_wired.ip.dhcp.option12_format" "value"</pre> <p><b>Values:</b> 0 to 109 alphanumeric characters</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command retrieves the value which will be used for option 12 (host name) to be used in the DHCP discovery packet of the internal wired print server.</p> <p><b>Format:</b></p> <pre>! U1 getvar "internal_wired.ip.dhcp.option12_format"</pre>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** This **setvar** example shows configuring the internal\_wired.ip.dhcp.option12\_format to the value contained in the device.friendly\_name.

It is necessary to surround the SGD entry to be used as source for the data with the < and > characters.

```
! U1 setvar "internal_wired.ip.dhcp.option12_format"
"<device.friendly_name>"
```

To further explain, if the above command was issued and the value currently stored in the device.friendly\_name parameter was "ShipPrinter", then the response to following command would be "ShipPrinter":

```
! U1 getvar "internal_wired.ip.dhcp.option12_value"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.option12\_value

This command retrieves the actual value which will be used in the discovery packet of the internal wired print server.

Commands	Details
<b>getvar</b>	<p>This command retrieves the actual value which will be used in the discovery packet of the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.dhcp.option12_value"</p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** This **setvar** example shows configuring the internal\_wired.ip.dhcp.option12\_format to the value contained in the device.friendly\_name.

It is necessary to surround the SGD entry to be used as source for the data with the < and > characters.

```
! U1 setvar "internal_wired.ip.dhcp.option12_format"
"<device.friendly_name>"
```

To further explain, if the above command was issued and the value currently stored in the device.friendly\_name parameter was "ShipPrinter", then the response to following command would be "ShipPrinter":

```
! U1 getvar "internal_wired.ip.dhcp.option12_value"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dhcp.requests\_per\_session

This command retrieves the maximum amount of DHCP discover requests for a single DHCP session on the internal wired print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the maximum amount of DHCP discover requests for a single DHCP session on the internal wired print server.</p> <p><b>Format:</b>  <b>! U1 setvar "internal_wired.ip.dhcp.requests_per_session" "value"</b></p> <p><b>Values:</b> 1-10  <b>Default:</b> "2"</p>
<b>getvar</b>	<p>This command retrieves the currently set maximum amount of DHCP discover requests for a single DHCP session on the internal wired print server.</p> <p><b>Format:</b>  <b>! U1 getvar "internal_wired.ip.dhcp.requests_per_session"</b></p>

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** This **setvar** example shows the value set to "2".

```
! U1 setvar "internal_wired.ip.dhcp.requests_per_session" "2"
```

When the **setvar** value is set to "2", the **getvar** result is "2".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.dns.servers

This command retrieves a space delimited list of the domain name servers from an internal wired print server.

Commands	Details
<b>getvar</b>	This command retrieves a list of space delimited DNS internal wired print servers. <b>Format:</b> ! U1 getvar "internal_wired.ip.dns.servers"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.gateway

This command instructs the printer to change the internal wired print servers gateway address.

**Important** • This setting refers to the gateway address. A set value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the internal wired printer servers gateway address. <b>Format:</b> ! U1 setvar "internal_wired.ip.gateway" "value" <b>Values:</b> Any valid gateway address <b>Default:</b> "0.0.0.0"
<b>getvar</b>	This command instructs the printer to respond with the internal wired printer servers gateway address. <b>Format:</b> ! U1 getvar "internal_wired.ip.gateway"

**Example:** This **setvar** example shows the value set to "10.3.5.1".

```
! U1 setvar "internal_wired.ip.gateway" "10.3.5.1"
```

When the **setvar** value is set to "10.3.5.1", the **getvar** result is "10.3.5.1".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.netmask

This setting refers to the internal wired print server's subnet mask address. This value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the internal wired print servers subnet mask. <b>Format:</b> ! U1 setvar "internal_wired.ip.netmask" "value" <b>Values:</b> Any valid subnet mask. <b>Default:</b> "255.255.255.0"
<b>getvar</b>	This command instructs the printer to respond with internal wired print servers subnet mask. <b>Format:</b> ! U1 getvar "internal_wired.ip.netmask"

**Example:** This **setvar** example shows the value set to "255.255.255.0".

```
! U1 setvar "internal_wired.ip.netmask" "255.255.255.0"
```

When the **setvar** value is set to "255.255.255.0", the **getvar** result is "255.255.255.0".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.port

This printer setting refers to the internal wired print servers port number that the TCP print service is listening on. Normal TCP communications from the host should be directed to this port.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the internal wired print servers TCP/UDP port number. <b>Format:</b> ! U1 setvar "internal_wired.ip.port" "value" <b>Values:</b> 1 - 65535 (excluding any ports currently used by other services, such as 21, 23, 80, and 515). <b>Default:</b> "9100"
<b>getvar</b>	This command instructs the printer to respond with the internal wired printer servers TCP/UDP port number. <b>Format:</b> ! U1 getvar "internal_wired.ip.port"

**Example:** This **setvar** example shows the value set to "9100".

```
! U1 setvar "internal_wired.ip.port" "9100"
```

When the **setvar** value is set to "9100", the **getvar** result is "9100".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.port\_alternate

This command sets the port number of the alternate port.

**Note •** Print servers supporting this command will monitor both the primary port and the alternate port for connections at the same time.

Commands	Details
<b>setvar</b>	This command sets the alternate port for the print server. <b>Format:</b> ! U1 setvar "internal_wired.ip.port_alternate" "value" <b>Values:</b> Any valid TCP port address. <b>Default:</b> "9100"
<b>getvar</b>	This command returns the current alternate port setting. <b>Format:</b> ! U1 setvar "internal_wired.ip.port_alternate" <b>Values:</b> The current port setting.

### Supported Devices

- iMZ 220, iMZ 320
- QLn220, QLn320, QLn420
- ZD410, ZD420, ZD500
- ZQ510, ZQ520
- ZR338, ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.port\_json\_config

This command determines the TCP port number to listen on for JSON configuration packets.

Commands	Details
<b>setvar</b>	<p>This command sets the TCP port number to listen on for JSON configuration packets.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.port_json_config" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>• <b>0</b> = disable the port</li> <li>• <b>1-65535</b> = Port number to listen on.</li> </ul> <p><b>Note</b> • Ports that are already in use or the standard network ports are invalid values.</p> <p><b>Default:</b> "9200"</p>
<b>getvar</b>	<p>This command retrieves the port number.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.port_json_config"</p>

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type **setvar, getvar**

**Example:** This example sets the port value to listen on as 1234.

```
! U1 setvar "internal_wired.ip.port_json_config" "1234"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.protocol

This command configures the IP addressing method used by the internal wired print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to configure the IP addressing method used by the internal wired print server.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.protocol" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"bootp" = uses the standard bootp addressing method to obtain an IP address and configuration</li> <li>"dhcp" = uses the standard dhcp addressing method to obtain an IP address and configuration for a server specified period of time</li> <li>"rarp" = uses the standard rarp addressing method to obtain an IP address</li> <li>"glean" = uses the IP address from a PING packet that is sent to its hardware address (unicast address)</li> <li>"permanent" = uses static values assigned through other commands</li> <li>"all" = tries all of the dynamic addressing methods, not permanent, to obtain an IP address</li> </ul> <p><b>Default:</b> "all"</p>
<b>getvar</b>	<p>This command returns the IP addressing method used by the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.protocol"</p>

**Example:** In this example, the **setvar** result is the current programming language that the printer is using.

```
! U1 setvar "internal_wired.ip.protocol" "bootp"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "bootp".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.timeout.enable

This network setting refers to enabling the connection timeout on the internal wired print server. For this to take effect, the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to enable or disable the timeout checking on the internal wired print server.</p> <p><b>Format:</b> ! U1 setvar "internal_wired.ip.timeout.enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = turns off the connection checking</li> <li>"on" = turns on the connection checking</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to return whether the timeout checking is enabled on the internal wired print server.</p> <p><b>Format:</b> ! U1 getvar "internal_wired.ip.timeout.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "internal_wired.ip.timeout.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.timeout.value

This network setting refers to the number of seconds before the connection times out for the internal wired print server. For this to take effect, the print server must be reset.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the time of the internal wired print server, in seconds, before the connection times out. <b>Format:</b> ! U1 setvar "internal_wired.ip.timeout.value" "value" <b>Values:</b> "1" through "3600" <b>Default:</b> "300"
<b>getvar</b>	This command instructs the printer to respond with the time of the internal wired print server, in seconds, before the connection times out. <b>Format:</b> ! U1 getvar "internal_wired.ip.timeout.value"

**Example:** This **setvar** example shows the value set to "300".

```
! U1 setvar "internal_wired.ip.timeout.value" "300"
```

When the **setvar** value is set to "300", the **getvar** result is "300".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.wins.addr

Sets or returns the current WINS server address. If WinsAddressing is DHCP, then this will automatically be filled by the DHCP server.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "internal_wired.ip.wins.addr" "value" <b>Values:</b> a valid WINS IP address. <b>Default:</b> "0.0.0.0"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "internal_wired.ip.wins.addr" <b>Result:</b> the current WINS server address

### Supported Devices

- 140XiIIIPlus, 170XiIIIPlus, 170XiIIIPlus,  
220XiIIIPlus
- 170Xi4, 220Xi4
- GK420d, , GK420t, GK888t
- GT800 (ZPL)
- GX420d, GX420t, GX430t
- HC100
- iMZ220, iMZ320
- KR403
- LP 2824 Plus
- QLn220, QLn320, QLn420, QL420+
- S4M
- Z4MPPlus, Z6MPPlus
- ZD410, ZD420
- ZD500
- ZE500
- ZM400, ZM600
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.ip.wins.permanent\_source

Specifies if the WINS address will be permanent or set via DHCP.

Commands	Details
<b>setvar</b>	<p><b>Format:</b> ! U1 setvar "internal_wired.ip.wins.permanent_source" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = use DHCP-assigned WINS address</li> <li>"on" = use currently stored WINS address</li> </ul> <p>The WINS address can be set using the <b>interface.network.active.wins_address</b> command.</p> <p><b>Default:</b> "off"</p>
<b>getvar</b>	Format: ! U1 getvar "internal_wired.ip.wins.permanent_source"

### Supported Devices

- 140XiIIIPlus, 170XiIIIPlus, 170XiIIIPlus,  
220XiIIIPlus
- 170Xi4, 220Xi4
- GK420d, , GK420t, GK888t
- GT800 (ZPL)
- GX420d, GX420t, GX430t
- HC100
- iMZ220, iMZ320
- KR403
- LP 2824 Plus
- QLn220, QLn320, QLn420, QL420+
- S4M
- Z4MPlus, Z6MPlus
- ZD410, ZD420
- ZD500
- ZE500
- ZM400, ZM600
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.mac\_addr

This command retrieves the MAC address of the internal wired print server.

Commands	Details
getvar	This command instructs the printer to respond with the MAC address of the internal wired print server. <b>Format:</b> ! U1 getvar "internal_wired.mac_addr"

→ **Example:** In this example, the **getvar** result is the MAC address of the internal wired print server.

```
! U1 getvar "internal_wired.mac_addr"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## internal\_wired.mac\_raw

This command identifies the RAW MAC address of the internal wired print server. The raw mac address is the mac address without the colons (":").

Commands	Details
<b>getvar</b>	This command retrieves the RAW MAC address of the internal wired print server. <b>Format:</b> ! U1 getvar "internal_wired.mac_raw"

### Supported Devices

- ZM400/ZM600
- RZ400/RZ600

**Example:** In this example, the **getvar** retrieves the RAW MAC address of the internal wired print server.

```
! U1 getvar "internal_wired.mac_raw"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# SGD Wireless Commands

This chapter provides a high-level overview of the wireless Set / Get / Do (SGD) commands and details on each SGD command. For printer support of these SGD commands, see [SGD Command Support on page 1365](#).

.151

SGD commands are available in printers with the following firmware versions or later:

- V60.16.2Z or later
- V60.15.xZ or later
- V50.15.xZ or later
- V61.15.xZ or later
- V56.15.xZ or later
- V53.16.x or later
- V53.15.2Z or later
- R53.16.3Z or later
- R60.15.8Z or later
- R62.15.8Z or later
- R63.15.8Z or later
- R65.15.8Z or later

**Note** • The commands listed in this chapter are for use with the Wireless Print Server and Wireless Plus Print Server, when used with firmware version V60.15.x, V50.15.x, or later.

!

**Important** • These are important points to note when using ZPL and SGD commands:

- SGD commands are case-sensitive.
- ZPL and SGD commands should be sent to the printer as separate files.
- Certain settings can be controlled by both ZPL and SGD. Configuration changes made in ZPL can affect configuration changes made in SGD.
- Changes made with one command type (ZPL or SGD) will affect the data returned to the host in response to both ZPL and getvar commands. The command type (ZPL or SGD) that was sent last determines the current setting.
- Some RF cards do not support all of the SGD commands.

**Important** • These are important points to note when using a Zebra G-Series printer:

- You can send instructions to the printer using multiple programming languages: EPL, ZPL, or SGD. EPL and ZPL commands configure the printer, print labels, and get device status information. SGD commands set and get configuration details. These three languages can be used without the need to send the printer instructions to switch from one language to another.
- EPL, ZPL, and SGD commands must be sent to the printer as separate files. They cannot be used together in one format, or set of commands. For example, if you send a series of SGD commands to the printer and they are followed by a printable format, this needs to be done using separate files.

## Overview

This section describes how and why to use the Set / Get / Do (SGD) commands. It also provides an example of a typical command structure.

**Note** • SGD commands must be terminated by a carriage return or a space and line feed.

SGD commands are commands that allow you to configure all printers with firmware version V60.15.x, V50.15.x, V61.15.x, V56.15.x, V53.15.xZ, or later. The printer performs the specified function immediately after receiving the command. The commands are:

- **setvar**
- **getvar**
- **do**

### setvar Command

**Setvar** commands:

- are used to configure printer settings to specific values by setting them in the printer
- must be terminated by a space character or a CR/ LF (0x0D, 0x0A)

**Important** • The setvar command and attributes must be specified in lower case.

### getvar Command

**Getvar** commands:

- are used to get the current value of the printer settings
- must be terminated by a space character or CR/LF (0x0D, 0x0A)

The printer responds with the printer setting of "?" if:

- the printer setting does not exist (usually due to incorrect spelling of the printer setting)
- it has not been configured yet

**Important** • The printer settings and attributes must be specified in lower case.

### do Command

**Do** commands:

- are used to instruct the printer to perform predefined actions
- must be terminated by a space character or a CR/LF (0x0D, 0x0A)

Some **Do** commands require additional settings which must be enclosed in double quotes.

**Important** • The values must be specified in lower case.

## Command Structure

It is important to understand the structure of the command and its components. A command structure illustration is provided for each command in this guide.

**Example:** This is an example of a command structure illustration:

<b>1</b>	Command—always preceded with an exclamation point (!) and must be specified in lower case. A space resides between the ! and <b>U1</b> and between <b>U1</b> and the command ( <b>setvar</b> or <b>getvar</b> ).
<b>2</b>	Attribute—always in double quotes and must be specified in lower case.
<b>3</b>	Chosen value—always in double quotes. Only applicable for <b>setvar</b> and <b>do</b> .

This command must be terminated by a space character or a CR/ LF (0x0D, 0x0A).

## How to Send Multiple SGD Commands

For any **getvar**, **setvar**, or **do** command, if you issue the syntax without the "1" and use the END command followed by a space, multiple SGD commands are sent simultaneously.

**Example:** This syntax shows how you can send multiple **getvar** commands:

```

1 → ! U getvar "ip.telnet.enable"
      |
2 → | getvar "ip.dhcp.enable"
      |
3 → | getvar "ip.dhcp.cid_prefix"
      |
3 → → END
  
```

<b>1</b>	The command portion of the string does not use the "1" after the "! U".
<b>2</b>	Commands issued after the first command do not require the "! U".
<b>3</b>	The string of commands is terminated by the word "END" with a space after the word, and by a carriage return/ line feed.

## bluetooth.address

This command returns the printer's Bluetooth device address.

Commands	Details
getvar	This command retrieves the printer's Bluetooth address. <b>Format:</b> ! U1 getvar "bluetooth.address"

**Example:** In this example, the **getvar** command causes the printer to return the printer's Bluetooth address.

```
! U1 getvar "bluetooth.address"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.afh\_map

Sets or retrieves the default AFH (adaptive frequency hopping) channel map (Bluetooth radios 1.2 and later); 20 bytes.

Commands	Details
<b>setvar</b>	Selectively enables or disables individual Bluetooth channels for use when AFH mode is set to "on". <b>Format:</b> ! U1 setvar "bluetooth.afh_map" "value" <b>Values:</b> 20-byte string of hexadecimal characters <b>Default:</b> "7FFFFFFFFFFFFFFFFFFF"
<b>getvar</b>	Retrieves default AFH channel map. <b>Format:</b> ! U1 getvar "bluetooth.afh_map"

**Example:** This **setvar** example shows the value set to "7FFFFFFFFFFFFFFFFFFF".

```
! U1 setvar "bluetooth.afh_map" "7FFFFFFFFFFFFFFFFFFF"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "7FFFFFFFFFFFFFFFFFFF".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.afh\_map\_curr

This command retrieves the current AFH (adaptive frequency hopping) channel map (Bluetooth radios 1.2 and later).

Commands	Details
<b>getvar</b>	This command retrieves the current AFH channel map. <b>Format:</b> ! U1 getvar "bluetooth.afh_map_curr"

→ **Example:** In this example, the **getvar** command causes the printer to retrieve the current AFH channel map.

```
! U1 getvar "bluetooth.afh_map_curr"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.afh\_mode

This command sets or retrieves AFH (adaptive frequency hopping) mode setting (Bluetooth radios 1.2 and later).

Commands	Details
<b>setvar</b>	<p>This command enables and disables AFH mode.</p> <p><b>Format:</b> ! U1 setvar "bluetooth.afh_mode" "value"</p> <p><b>Values:</b></p> <p>"on" = enables AFH mode "off" = disables AFH mode</p> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command retrieves the current setting of the AFH mode.</p> <p><b>Format:</b> ! U1 getvar "bluetooth.afh_mode"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "bluetooth.afh_mode" "on"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "on".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.authentication

This command sets or retrieves Bluetooth authentication mode and works in combination with the **bluetooth.bluetooth\_pin**.

Commands	Details
<b>setvar</b>	<p>This command enables and disables Bluetooth authentication.</p> <p><b>Format:</b> ! U1 setvar "bluetooth.authentication" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"<b>off</b>" = disables authentication (can connect to master device without PIN)</li><li>"<b>setpin</b>" = enables authentication (requires PIN or passkey to connect to a master device)</li></ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command retrieves the current Bluetooth authentication mode.</p> <p><b>Format:</b> ! U1 getvar "bluetooth.authentication"</p>

**Example:** This **setvar** example shows the value set to "setpin".

```
! U1 setvar "bluetooth.authentication" "setpin"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "setpin".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.bluetooth\_pin

This command is used to connect to the printer only when the command **bluetooth.authentication** is set to "setpin".

Commands	Details
<b>setvar</b>	This command sets the Bluetooth pin value. <b>Format:</b> ! U1 setvar "bluetooth.bluetooth_pin" "value" <b>Values:</b> Any text string up to 10 characters <b>Default:</b> ""
<b>getvar</b>	This command retrieves the current Bluetooth pin. <b>Format:</b> ! U1 getvar "bluetooth.bluetooth_pin"

→ **Example:** This **setvar** example shows the value set to "1234567890".  
! U1 setvar "bluetooth.bluetooth\_pin" "1234567890"

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "1234567890".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.clear\_bonding\_cache

Deletes all information related to previous Bluetooth pairing events from the printer.

Commands	Details
do	<b>Format:</b> ! U1 do "bluetooth.clear_bonding_cache" <b>Values:</b> NA <b>Default:</b> NA

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.date

This command shows the release date of the Bluetooth module.

### getvar

Commands	Details
getvar	This command shows the release date of the Bluetooth module. <b>Format:</b> ! U1 getvar "bluetooth.date"

**Example:** In this example, the **getvar** command returns the release date of the Bluetooth module.

```
! U1 getvar "bluetooth.date"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.discoverable

This command enables or disables the Bluetooth discoverable mode.

Commands	Details
<b>setvar</b>	<p>This command enables or disables the Bluetooth discoverable mode.</p> <p><b>Format:</b> ! U1 setvar "bluetooth.discoverable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"on" = enables Bluetooth discoverable mode</li><li>"off" = disables Bluetooth discoverable mode</li></ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command retrieves the current Bluetooth discoverable mode.</p> <p><b>Format:</b> ! U1 getvar "bluetooth.discoverable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "bluetooth.discoverable" "on"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.enable

This command enables or disables the Bluetooth radio.

Commands	Details
<b>setvar</b>	<p>This command enables or disables the Bluetooth radio.</p> <p><b>Format:</b> ! U1 setvar "bluetooth.enable"</p> <p><b>Values:</b></p> <p>"on" = enables the Bluetooth radio "off" = disables the Bluetooth radio</p> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command retrieves the current status of the Bluetooth radio.</p> <p><b>Format:</b> ! U1 getvar "bluetooth.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "bluetooth.enable" "on"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.friendly\_name

This command sets the friendly name, which is used during service discovery. For changes to take effect, you must power cycle the printer or issue the **device.reset** command. If **bluetooth.friendly\_name** is not set by you, it will default to the printer serial number.

Commands	Details
<b>setvar</b>	This command sets the Bluetooth discoverable mode. <b>Format:</b> ! U1 setvar "bluetooth.friendly_name" "value" <b>Values:</b> Any text string up to 17 characters
<b>getvar</b>	This command retrieves the current Bluetooth discoverable mode. <b>Format:</b> ! U1 getvar "bluetooth.friendly_name"

**Example:** This **setvar** example shows the value set to "1234567".

```
! U1 setvar "bluetooth.friendly_name" "1234567"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "1234567".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.json\_config\_channel\_enable

Enables or disables the Bluetooth JSON configuration channel. Changes to this command setting only take effect when the printer is reset or power cycled.

**Note** • The JSON config channel will stop being advertised when there is no connection to the JSON channel and there is no connection on the main SPP channel.

**Important** • All Bluetooth devices must first make an SPP connection before being able to make the JSON channel connection to a printer.

<b>setvar</b>	<b>Format:</b> ! U1 setvar "bluetooth.json_config_channel_enable" "value" <b>Values:</b> "on" - the channel is advertised and available for use only when the main serial port protocol (SPP) channel is connected. "off" - the channel is not advertised or available for use. <b>Default:</b> "on" <b>Example:</b> ! U1 setvar "bluetooth.json_config_channel_enable" "off"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "bluetooth.json_config_channel_enable"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.le.controller\_mode

For printers that support both Bluetooth Classic and Bluetooth Low-Energy mode, this command controls the mode of operation.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "bluetooth.le.controller_mode" "value" <b>Values:</b> "both" = the Bluetooth radio operates in both low energy and classic mode "le" = the Bluetooth radio operates in low energy mode "classic" = the Bluetooth radio operates in the classic mode <b>Default:</b> "both"
getvar	<b>Format:</b> ! U1 getvar "bluetooth.le.controller_mode"

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.le.minimum\_security

Determines the minimum device-level security settings the printer will use to connect for Bluetooth Low-Energy (LE) connections.

Commands	Details
<b>setvar</b>	<p><b>Format:</b> ! U1 setvar "bluetooth.le.minimum_security" "value"</p> <p><b>Values:</b> "none" = security is not required unless the particular Bluetooth LE service or characteristic being accessed requires security.</p> <p>For all other choices, all services will require pairing and apply some form of security.</p> <ul style="list-style-type: none"> <li>"unauth_key_signing" = (un)authenticated pairing and signing keys are required</li> <li>"auth_key_signing" = authenticated pairing and signing keys are required.</li> <li>"unauth_key_encrypt" = (un)authenticated pairing and encryption are required.</li> <li>"auth_key_encrypt" = authenticated pairing and encryption are required.</li> </ul> <p><b>Default:</b> "none" - if the printer has a Bluetooth LE radio. If the printer does not have a Bluetooth LE radio installed, there is no default value.</p>
<b>getvar</b>	<p><b>Format:</b> ! U1 getvar "bluetooth.le.minimum_security"</p> <p>If the printer does not have a Bluetooth LE radio installed, the printer will return an empty string.</p>

### Supported Devices

- ZQ510, ZQ520

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.local\_name

This command retrieves the local name that is provided during service discovery.

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the local name that is provided during service discovery. <b>Format:</b> ! U1 getvar "bluetooth.local_name"

**Example:** In this example, the **getvar** command returns the local name that is provided during service discovery.

```
! U1 getvar "bluetooth.local_name"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.minimum\_security\_mode

This printer setting parameter sets the Bluetooth Minimum Security mode. Minimum Security Mode provides for three levels of security, depending on the printer radio version and printer firmware: "1", "2", and "3".

**Important** • This feature is available in printers with Bluetooth® radio version 2.0 or higher.

Commands	Details
<b>setvar</b>	<p>Sets the Bluetooth Minimum Security mode</p> <p><b>Format:</b> ! U1 setvar "bluetooth.minimum_security_mode" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"1" = Security mode 1 - the printer will:           <ul style="list-style-type: none"> <li>• be discoverable</li> <li>• not require a PIN to connect to</li> </ul> </li> <li>"2" = the printer will:           <ul style="list-style-type: none"> <li>• switch to bluetooth.authentication = "setpin" (Connecting device must provide the printer's bluetooth.bluetooth_pin),</li> <li>• switch to Bluetooth.encryption = "on", and</li> <li>• use existing Bluetooth.discoverable setting</li> </ul> </li> <li>"3" = Link Level Enforced Security - the printer will:           <ul style="list-style-type: none"> <li>• switch to bluetooth.authentication = "setpin" (Connecting device must provide the printer's bluetooth.bluetooth_pin)</li> <li>• switch to bluetooth.encryption = "on"</li> <li>• switch to bluetooth.discoverable = "off"</li> <li>• only connect to devices which use Link Level Enforced Security</li> </ul> </li> </ul> <p><b>Default:</b> "1"</p>
<b>getvar</b>	<p>Retrieves the current Bluetooth Minimum Security Mode.</p> <p><b>Format:</b> ! U1 getvar "bluetooth.minimum_security_mode"</p>

### Supported Devices

- EZ320™
- Link-OS printers with firmware Vxx.19.7Z and later.

**Example:** This **setvar** example shows the value set to "2".

```
! U1 setvar "bluetooth.minimum_security_mode" "2"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.radio\_auto\_baud

This command retrieves the Bluetooth radio data rate.

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves Bluetooth radio data rate. <b>Format:</b> ! U1 getvar "bluetooth.radio_auto_baud"

**Example:** In this example, the **getvar** retrieves the short Bluetooth address.

**! U1 getvar "bluetooth.radio\_auto\_baud"**

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.radio\_version

This command returns the version of the currently installed Bluetooth radio.

### getvar

Commands	Details
getvar	This command returns the version of the currently installed Bluetooth radio. <b>Format:</b> ! U1 getvar "bluetooth.radio_version"

**Example:** In this example, the **getvar** command returns the currently installed Bluetooth radio.

```
! U1 getvar "bluetooth.radio_version"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## bluetooth.short\_address

This command shortens the Bluetooth address by removing the colons (":").

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the shortened Bluetooth address. <b>Format:</b> ! U1 getvar "bluetooth.short_address"

**Example:** In this example, the **getvar** retrieves the short Bluetooth address.  
**! U1 getvar "bluetooth.short\_address"**

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## bluetooth.version

This command returns the Bluetooth library version number.

### getvar

Commands	Details
getvar	This command returns the Bluetooth library version number. <b>Format:</b> ! U1 getvar "bluetooth.version"

**Example:** In this example, the **getvar** command returns the Bluetooth library version number.

```
! U1 getvar "bluetooth.version"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## card.mac\_addr

This command retrieves the MAC address of the wireless radio card.

**getvar**

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the MAC address. <b>Format:</b> ! U1 getvar "card.mac_addr"

- **Example:** In this example, the **getvar** result is the MAC address for the wireless radio card.  
! U1 getvar "card.mac\_addr"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## card.inserted

This command indicates whether the wireless radio card is or is not inserted.

### getvar

Commands	Details
getvar	<p>This command instructs the printer to respond with the wireless radio card status. It's inserted or it's not inserted.</p> <p><b>Format:</b> ! U1 getvar "card.inserted"</p>

**Example:** In this example, the **getvar** result is "Inserted".

**! U1 getvar "card.inserted"**

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.active\_network

This command displays if the printer is actively connected to wireless, external wired, or internal wired.

### getvar

Commands	Details
<b>getvar</b>	<p>This command instructs the printer to respond with what the printer is currently connected to internal wired, wireless, external wired, or unknown. <a href="#">Table 31</a> provides details on the potential return values.</p> <p><b>Format:</b> ! U1 getvar "ip.active_network"</p>

→ **Example:** In this example, the **getvar** will return the current active network the printer is connected to.

```
! U1 getvar "ip.active_network"
```

**Table 31 • Printer Responses**

Return Values	Details
"internal wired"	This is the return value when an internal wired device is detected.
"wireless"	This is the return value when a wireless device is detected.
"external wired"	This is the return value when an external wired device is detected.
"unknown"	<p>This is the return value:</p> <ul style="list-style-type: none"> <li>if the printer has not established a network connection on any of the devices</li> <li>if you don't have any of the network devices plugged in</li> <li>if the printer is still trying to establish a connection (i.e. on wireless it is going through the association process).</li> </ul>

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.addr

This command allows you to get or set the printer's IP address.

**Important** • For a set IP address to take affect, the IP protocol must be set to permanent and the print server must be reset.

Commands	Details
<b>setvar</b>	This command instructs the printer to change its current IP address upon powering the printer on. <b>Format:</b> ! U1 setvar "ip.addr" "value" <b>Values:</b> any valid IP address <b>Default:</b> "0.0.0.0"
<b>getvar</b>	This command instructs the printer to respond with its current IP address. <b>Format:</b> ! U1 getvar "ip.addr"

**Note** • The **setvar** value of this command can be affected by the **ip.dhcp.enable** command.

**Example:** This **setvar** example shows the value set to "10.14.4.235".

```
! U1 setvar "ip.addr" "10.14.4.235"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "10.14.4.235".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.arp\_interval

This printer setting allows you to specify the ARP (Address Resolution Protocol) interval or the ARP cache time out.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the ARP interval or the ARP cache time out. <b>Format:</b> ! U1 setvar "ip.arp_interval" "value" <b>Values:</b> 0 - 30 <b>Default:</b> "0"
<b>getvar</b>	This command instructs the printer to respond with the ARP interval or the ARP cache time out value in seconds. <b>Format:</b> ! U1 getvar "ip.arp_interval"

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "ip.arp_interval" "0"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "0".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.bootp.enable

This printer setting turns BOOTP on or off. BOOTP is a method for acquiring an IP address, netmask, and gateway automatically on printer power-up. It requires a BOOTP server on the local network.

**Note •** If you are using static IP addressing, the IP protocol must be set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn BOOTP on or off. <b>Format:</b> ! U1 setvar "ip.bootp.enable" "value" <b>Values:</b> "off" = printer does not use BOOTP to get the IP address "on" = printer uses BOOTP to get the IP address <b>Default:</b> "on"
<b>getvar</b>	This command instructs the printer to respond with the current BOOTP setting. <b>Format:</b> ! U1 getvar "ip.bootp.enable"

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.bootp.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.arp\_verify

This command configures the print server to send out an ARP request during the DHCP address negotiation. This is used to verify if the IP address received from the DHCP server is in use.

- If an ARP reply is received, a DHCP DECLINE message is sent to the DHCP server telling it that the received address cannot be used and then the normal DHCP procedure is restarted.
- If no ARP reply is received the DHCP address is used.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn on ARP verify.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.arp_verify" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on"</li> <li>"off"</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command returns whether the printer will send the ARP request during the DHCP negotiation.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.arp_verify"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.dhcp.arp_verify" "on"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.auto\_provision\_enable

This command prepares the printer to receive Weblink settings from the DHCP server. These settings are used to allow the printer to connect to on-premise or web-based servers.

If DHCP receives option 43 in the format of "**10642 <auto provision code> < auto provision settings>**" and the Client is not already configured, the client will use the configuration to connect to the server.

Using this feature requires configuring your DHCP server to send option 43 information during address assignment. The feature allows the printer to obtain the settings used to control Cloud Connect weblink connections or Mirror events as part of receiving a DHCP assigned IP address. This requires that DHCP option 60 is not empty and that **ip.dhcp.auto\_provision\_enable** is set to "on".

The package of Cloud Connect/weblink information sent from the DHCP server in the Option 43 response can include the:

- Server address
- Authentication server name
- User name and password for proxy logins

The package of Mirror information sent from the DHCP server in the Option 43 packet can include the:

- Server address
- Mirror path
- Mirror feedback path
- Mirror appl path
- Mirror mode

Commands	Details
<b>setvar</b>	<p>This command enables or disables the DHCP auto provision feature of the printer.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.auto_provision_enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on" = enabled</li> <li>"off" = disabled</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command retrieves the current value of on or off for the DHCP auto provision feature.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.auto_provision_enable"</p>

### Supported Devices

- iMZ™ series
- QLn™ series
- ZT200™ series
- ZT400™ series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.cache\_ip

This command enables or disables the IP caching.

Commands	Details
<b>setvar</b>	This command sets the status of the IP cache. <b>Format:</b> ! U1 setvar "ip.dhcp.cache_ip" "value" <b>Values:</b> "on" = enabled "off" = disabled <b>Default:</b> "off"
<b>getvar</b>	This command retrieves the status of the IP cache. <b>Format:</b> ! U1 getvar "ip.dhcp.cache_ip"

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "ip.dhcp.cache_ip" "off"
```

When the **setvar** value is set to "off", the **getvar** result is "off".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.cid\_all

This printer setting defines the entire client identifier (DHCP option 61) if the DHCP is enabled and "ip.dhcp.cid\_type" is set to "0", or "2". The MAC address is used if the type is set to "1".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the CID prefix and suffix.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.cid_all" "value"</p> <p><b>Values:</b> A maximum length of 60 characters if the CID type is ASCII, or 120 characters if the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier prefix and suffix.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.cid_all"</p>

**Example:** This **setvar** example shows the value set to "printer".

```
! U1 setvar "ip.dhcp.cid_all" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## ip.dhcp.cid\_enable

This command determines if DHCP (option 61) is turned on or off.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the status of the client identifier. <b>Format:</b> ! U1 setvar "ip.dhcp.cid_enable" "value" <b>Values:</b> "off" = client identifier is turned off "on" = client identifier is turned on <b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the status of the client identifier. <b>Format:</b> ! U1 getvar "ip.dhcp.cid_enable"</p>

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "ip.dhcp.cid_enable" "off"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "off".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.cid\_prefix

This printer setting defines the prefix to be prepended to the DHCP client identifier (option 61) when DHCP is enabled and "ip.dhcp.cid\_type" is set to "0" or "2".

Commands	Details
<b>setvar</b>	This command instructs the printer to change the CID prefix. <b>Format:</b> ! U1 setvar "ip.dhcp.cid_prefix" "value" <b>Values:</b> Any text string up to 10 characters if the CID type is ASCII, or 20 characters if the CID type is hexadecimal. <b>Default:</b> ""
<b>getvar</b>	This command instructs the printer to respond with the client identifier prefix. <b>Format:</b> ! U1 getvar "ip.dhcp.cid_prefix"

**Example:** This **setvar** example sets the value to "ZEB".

```
! U1 setvar "ip.dhcp.cid_prefix" "ZEB"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "ZEB".

The next time the printer sends a DHCP request, if **ip.dhcp.cid\_type** is "0", the client identifier sent will be prefixed with the string "ZEB". For example, if **ip.dhcp.cid\_value** is "PRT001", the actual client identifier sent will be "ZEPRT001"

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.cid\_suffix

This printer setting defines the unique suffix to be used as the client identifier (DHCP option 61) if DHCP is enabled and "ip.dhcp.cid\_type" is set to "0" or "2".

Commands	Details
<b>setvar</b>	This command instructs the printer to change the CID value. <b>Format:</b> ! U1 setvar "ip.dhcp.cid_suffix" "value" <b>Values:</b> The maximum length of a value allowed is 60 ASCII characters when the CID type is ASCII, or 120 hexadecimal values when the CID type is hexadecimal. <b>Default:</b> ""
<b>getvar</b>	This command instructs the printer to respond with the client identifier suffix. <b>Format:</b> ! U1 getvar "ip.dhcp.cid_suffix"

**Example:** This **setvar** example shows the value set to "printer".

```
! U1 setvar "ip.dhcp.cid_suffix" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.cid\_type

This printer setting defines the type of client identifier (DHCP option 61) that will be sent if DHCP is enabled. A value of "1" means the type of "Ethernet" and the printer's MAC address will be used. A value of "0" or "2" means the client identifier sent will be "[ip.dhcp.cid\\_prefix](#)" concatenated with "[ip.dhcp.cid\\_suffix](#)".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the Client Identifier type.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.cid_type" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"0" = ASCII string</li> <li>"1" = wireless radio card's MAC address</li> <li>"2" = HEX value</li> </ul> <p><b>Default:</b> "1"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier type.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.cid_type"</p>

**Example:** This **setvar** example shows the value set to "1".

```
! U1 setvar "ip.dhcp.cid_type" "1"
```

When the **setvar** value is set to "1", the **getvar** result is "1".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.cid\_value

This parameter defines the unique value to be used as the client identifier (option 61) if DHCP is enabled and “ip.dhcp.cid\_type” is “1”.

**Note •** This parameter is only applicable if [ip.dhcp.cid\\_enable](#) is set to “on”.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the CID value.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.cid_value" "value"</p> <p><b>Values:</b> Any text string up to 20 characters in length.</p> <p><b>Default:</b></p> <p>If <a href="#">ip.dhcp.cid_type</a> is set to:</p> <ul style="list-style-type: none"> <li>• "0" — the default is the printer’s friendly name (see <a href="#">device.friendly_name</a> on page 685).</li> <li>• "1" — the default is the printer’s MAC address.</li> </ul>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier value.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.cid_value"</p>

**Example:** This **setvar** example changes the cid value to “PRT001”.

```
! U1 setvar "ip.dhcp.cid_value" "PRT001"
```

The next time the printer sends a DHCP request, if [ip.dhcp.cid\\_type](#) is “0”, the client identifier sent will be [ip.dhcp.cid\\_prefix](#) plus “PRT001”. For example, if [ip.dhcp.cid\\_prefix](#) is “ZEB”, the actual client identifier sent will be “ZEPRT001”

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.enable

This printer setting turns DHCP on or off. DHCP is a method for acquiring an IP address, netmask, and gateway automatically on printer power-up. It requires a DHCP server on the local network.

**Note •** If you are using static IP addressing, the IP protocol must be set to permanent.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn DHCP on or off.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = printer does not use DHCP to get the IP address</li> <li>"on" = printer uses DHCP to get the IP address</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the DHCP status.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.dhcp.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.lease.last\_attempt

This command retrieves the time from the DHCP server of when the last DHCP request was sent.

### getvar

Commands	Details
getvar	This command retrieves the last time a DHCP request was sent. <b>Format:</b> ! U1 getvar "ip.dhcp.lease.last_attempt"

**Example:** In this example, the **getvar** retrieves the last time a DHCP request was sent to the wireless print server.

```
! U1 getvar "ip.dhcp.lease.last_attempt"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.lease.server

This command retrieves the address of the server that provided the DHCP lease on the wireless print server.

### getvar

Commands	Details
<b>getvar</b>	This command retrieves the address of the server that provided the DHCP lease on the wireless print server. <b>Format:</b> ! U1 getvar "ip.dhcp.lease.server"

→ **Example:** In this example, the **getvar** retrieves the server that provided the DHCP lease on the wireless print server.

```
! U1 getvar "ip.dhcp.lease.server"
```

```
"10.3.5.1"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.lease.time\_left

This command retrieves the time left in the current DHCP lease on the wireless print server.

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the time left in the current DHCP lease on the wireless print server. <b>Format:</b> ! U1 getvar "ip.dhcp.lease.time_left"

**Example:** In this example, the **getvar** retrieves the time left in the current DHCP lease on the wireless print server.

```
! U1 getvar "ip.dhcp.lease.time_left"
```

```
"1192518"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.ntp.enable

This command controls whether or not the printer retrieves the address of a Network Time Protocol (NTP) server during DHCP address assignment.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "ip.dhcp.ntp.enable" "value" <b>Values:</b> "off" = does not request the NTP server address "on" = requests the NTP server address <b>Default:</b> "off"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "ip.dhcp.ntp.enable"

### Supported Devices

- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.ntp.received\_servers

Returns the list of Network Time Protocol (NTP) server IP Addresses received via DHCP.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "ip.dhcp.ntp.received_servers" <b>Values:</b> A comma-separated list of IP address. The maximum number of servers listed will be three (3). <b>Default:</b> "" <b>Example:</b> "10.4.3.24,172.30.16.52"

### Supported Devices

- QLn220, QLn320, QLn420
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.option12

This command specifies if the DHCP option 12 (host name) is on or off in the discovery packet that is sent from the wireless print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the DHCP option 12 (host name) in the discovery packet that is sent from the wireless print server.</p> <p><b>Format:</b> ! U1 <b>setvar</b> "ip.dhcp.option12" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"on" = turns on option 12</li><li>"off" = turns off option 12</li></ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command retrieves the status of the DHCP option 12 (host name) in the discovery packet that is sent from the wireless print server.</p> <p><b>Format:</b> ! U1 <b>getvar</b> "ip.dhcp.option12"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.dhcp.option12" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.option12\_format

This command specifies the value which will be used for option 12 (host name) to be used in the DHCP discovery packet of the wireless print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the value which will be used for option 12 (host name) to be used in the DHCP discovery packet of the wireless print server.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.option12_format" "value"</p> <p><b>Values:</b> string</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command retrieves the value which will be used for option 12 (host name) to be used in the DHCP discovery packet of the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.option12_format"</p>

**Example:** This **setvar** example shows configuring the ip.dhcp.option12\_format to the value contained in the device.friendly\_name.

It is necessary to surround the SGD entry to be used as source for the data with the < and > characters.

```
! U1 setvar "ip.dhcp.option12_format" "<device.friendly_name>"
```

To further explain, if the above command was issued and the value currently stored in the device.friendly\_name parameter was "ShipPrinter", then the response to following command would be "ShipPrinter":

```
! U1 getvar "ip.dhcp.option12_value"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.option12\_value

This command retrieves the actual value which will be used in the discovery packet of the wireless print server.

### getvar

Commands	Details
getvar	<p>This command retrieves the actual value which will be used in the discovery packet of the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.option12_value"</p>

→ **Example:** This **setvar** example shows configuring the ip.dhcp.option12\_format to the value contained in the device.friendly\_name.

It is necessary to surround the SGD entry to be used as source for the data with the < and > characters.

```
! U1 setvar "ip.dhcp.option12_format" "<device.friendly_name>"
```

To further explain, if the above command was issued and the value currently stored in the device.friendly\_name parameter was "ShipPrinter", then the response to following command would be "ShipPrinter":

```
! U1 getvar "ip.dhcp.option12_value"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.request\_timeout

This command retrieves the maximum amount of time (in seconds) for a DHCP discovery requests on the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the amount of time (in seconds) to wait before timing out a DHCP discovery request. <b>Format:</b> ! U1 setvar "ip.dhcp.request_timeout" "value" <b>Values:</b> "2" through "30" <b>Default:</b> "2"
<b>getvar</b>	This command retrieves the currently set the amount of time (in seconds) to wait before timing out a DHCP discovery request. <b>Format:</b> ! U1 getvar "ip.dhcp.request_timeout"

**Example:** This **setvar** example shows the value set to "2".

```
! U1 setvar "ip.dhcp.request_timeout" "2"
```

When the **setvar** value is set to "2", the **getvar** result is "2".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.requests\_per\_session

This command retrieves the maximum amount of DHCP discovery requests for a single DHCP session on the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the maximum amount of DHCP discovery requests for a single DHCP session on the wireless print server. <b>Format:</b> ! U1 setvar "ip.dhcp.requests_per_session" "value" <b>Values:</b> "1" through "10" <b>Default:</b> "2"
<b>getvar</b>	This command retrieves the currently set maximum amount of DHCP discovery requests for a single DHCP session on the wireless print server. <b>Format:</b> ! U1 getvar "ip.dhcp.requests_per_session"

**Example:** This **setvar** example shows the value set to "2".

```
! U1 setvar "ip.dhcp.requests_per_session" "2"
```

When the **setvar** value is set to "2", the **getvar** result is "2".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.session\_interval

This command configures the time interval (in seconds) before a new DHCP session is started on the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the DHCP session time out value (in seconds). <b>Format:</b> ! U1 setvar "ip.dhcp.session_interval" "value" <b>Values:</b> "0" through "60" <b>Default:</b> "10"
<b>getvar</b>	This command retrieves the current DHCP session time out value (in seconds). <b>Format:</b> ! U1 getvar "ip.dhcp.session_interval"

**Example:** This **setvar** example shows the value set to "10".

```
! U1 setvar "ip.dhcp.session_interval" "10"
```

When the **setvar** value is set to "10", the **getvar** result is "10".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.user\_class\_id

This command sets or retrieves the current DHCP class ID setting.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "ip.dhcp.user_class_id" "value" <b>Values:</b> any class ID string, <b>Default:</b> ""
getvar	<b>Format:</b> ! U1 getvar "ip.dhcp.user_class_id" <b>Result:</b> the current DHCP class ID setting.

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- QLn420, ZD410
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dhcp.vendor\_class\_id

This command configures the DHCP vendor class ID setting.

Commands	Details
<b>setvar</b>	<p>This command sets the DHCP vendor class ID setting.</p> <p><b>Format:</b> ! U1 setvar "ip.dhcp.vendor_class_id" "value"</p> <p><b>Values:</b> Max string length of 64.</p> <p>This command builds a string using the following values: (device.company_name) (device.product_name)- (head.resolution.in_dpi) (device.pnp_option)</p> <p><b>Default:</b> The default varies by printer.</p>
<b>getvar</b>	<p>This command retrieves the current DHCP vendor class ID setting.</p> <p><b>Format:</b> ! U1 getvar "ip.dhcp.vendor_class_id"</p>

**Example:** For a Zebra ZT230 printer set at 203dpi, the result would be:

Zebra Technologies ZTC ZT230-2003dpi ZPL

### Supported Devices

- iMz™ series
- QLn™ series
- ZT200™ series
- ZD500R™ series
- ZT400™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dns.domain

This command identifies the network domain of the wireless print server.

### getvar

Commands	Details
getvar	This command retrieves the network domain of the wireless print server. <b>Format:</b> ! U1 getvar "ip.dns.domain"

**Example:** In this example, the **getvar** retrieves the network domain of the wireless print server.

```
! U1 getvar "ip.dns.domain"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.dns.servers

This command retrieves a space delimited list of the domain name servers from a wireless print server.

### getvar

Commands	Details
<b>getvar</b>	This command retrieves a list of space delimited DNS wireless print servers. <b>Format:</b> ! U1 getvar "ip.dns.servers"

**Example:** In this example, the **getvar** retrieves a list of space delimited DNS wireless print servers.

```
! U1 getvar "ip.dns.servers"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.ftp.enable

This printer setting refers to the FTP protocol setting. This command tells the printer to turn FTP on or off.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn FTP on or off.</p> <p><b>Format:</b> ! U1 setvar "ip.ftp.enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = disables FTP</li> <li>"on" = enables FTP</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the FTP status.</p> <p><b>Format:</b> ! U1 getvar "ip.ftp.enable"</p>

**Example:** This **setvar** example shows the FTP status set to "on".

```
! U1 setvar "ip.ftp.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is that the FTP status is "on".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.ftp.execute\_file

This command setting controls the printers' ability to process or not process commands received via the FTP protocol using the printers ZPL engine.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn FTP processing ability on or off. <b>Format:</b> ! U1 setvar "ip.ftp.execute_file" "value" <b>Values:</b> "off" = disables the printer's ability to process FTP commands "on" = enables the printer's ability to process FTP commands <b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the FTP processing ability status. <b>Format:</b> ! U1 getvar "ip.ftp.execute_file"</p>

**Example:** This **setvar** example shows the FTP processing ability set to "on".

```
! U1 setvar "ip.ftp.execute_file" "on"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.ftp.request\_password

This command controls whether the ftp client will prompt the user to enter a password at the beginning of an ftp session.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn on or off the ftp session password request.</p> <p><b>Format:</b> ! U1 setvar "ip.ftp.request_password" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"no"</li><li>"yes"</li></ul> <p><b>Default:</b> "no"</p>
<b>getvar</b>	<p>This command returns whether the ftp client is set to prompt the user for a password at the start of an ftp session.</p> <p><b>Format:</b> ! U1 getvar "ip.ftp.request_password"</p>

**Example:** This **setvar** example shows the value set to "yes".

```
! U1 setvar "ip.ftp.request_password" "yes"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.gateway

This command instructs the printer to change the gateway address.

**Important** • This setting refers to the gateway address. A set value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the gateway address. <b>Format:</b> ! U1 setvar "ip.gateway" "value" <b>Values:</b> Any valid gateway address <b>Default:</b> "0.0.0.0"
<b>getvar</b>	This command instructs the printer to respond with the gateway address. <b>Format:</b> ! U1 getvar "ip.gateway"

**Example:** This **setvar** example shows the value set to "10.3.5.1".

```
! U1 setvar "ip.gateway" "10.3.5.1"
```

When the **setvar** value is set to "10.3.5.1", the **getvar** result is "10.3.5.1".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.http.admin\_name

This command sets the name to be used for authentication on the print server web pages.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the admin user name to the specified value. <b>Format:</b> ! U1 setvar "ip.http.admin_name" "value" <b>Values:</b> a string with a maximum of 25 characters <b>Default:</b> "admin"
<b>getvar</b>	This command instructs the printer to respond with the admin user name. <b>Format:</b> ! U1 getvar "ip.http.admin_name" <b>Result:</b> A user name

**Example:** This **setvar** example shows the value set to "useradmin101".

```
! U1 setvar "ip.http.admin_name" "useradmin101"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.http.admin\_password

This command sets the password to be used for authentication on the print server web pages.

Commands	Details
<b>setvar</b>	This command instructs the printer to set print server web page password. <b>Format:</b> ! U1 setvar "ip.http.admin_password" "value" <b>Values:</b> a string, maximum 25 characters <b>Default:</b> 1234
<b>getvar</b>	This command instructs the printer to respond with the print server web page password. <b>Format:</b> ! U1 getvar "ip.http.admin_password"

**Example:** This **setvar** example shows the value set to "P@ssword101".

```
! U1 setvar "ip.http.admin_password" "P@ssword101"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.http.custom\_link\_name

This command creates a custom link below the FAQ link on the print server settings page. Use [ip.http.custom\\_link\\_url](#) on page 1103 to define the URL for your link name.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the custom link name. <b>Format:</b> ! U1 setvar "ip.http.custom_link_name" "value" <b>Values:</b> Any string, maximum of 25 characters <b>Default:</b> ""
<b>getvar</b>	This command instructs the printer to respond with the custom link name. <b>Format:</b> ! U1 getvar "ip.http.custom_link_name"

**Example:** This **setvar** example shows the value set to "Click Here for Info".

```
! U1 setvar "ip.http.custom_link_name" "Click Here for Info"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.http.custom\_link\_url

This command creates a custom link on the printer web page for the printer's URL. Use [ip.http.custom\\_link\\_name](#) on page 1102 to define the text that will display for your link.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the custom URL. <b>Format:</b> ! U1 setvar "ip.http.custom_link_url" "value" <b>Values:</b> A string of 64 characters or less <b>Default:</b> ""
<b>getvar</b>	This command instructs the printer to respond with the custom URL. <b>Format:</b> ! U1 getvar "ip.http.custom_link_url"

### Example:

```
! U1 setvar "ip.http.custom_link_url" "http://www.zebra.com/sdk"
```

### Supported Devices ZT200 Series

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.http.enable

This printer setting refers to the HTTP protocol/web server setting.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change HTTP to on or off. <b>Format:</b> ! U1 setvar "ip.http.enable" "value" <b>Values:</b>     "off" = disables HTTP protocol     "on" = enables HTTP protocol <b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the HTTP status. <b>Format:</b> ! U1 getvar "ip.http.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.http.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.http.faq\_url

This command sets the FAQ URL displayed on the printer web pages.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the FAQ URL. <b>Format:</b> ! U1 setvar "ip.http.faq_url" "value" <b>Values:</b> A string of 64 characters or less. <b>Default:</b> ""
<b>getvar</b>	This command instructs the printer to respond with the current FAQ URL. <b>Format:</b> ! U1 getvar "ip.http.faq_url"

### Example:

```
! U1 setvar "ip.http.faq_url" "http://www.yoursite.com/faq"
```

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.http.port

This command sets the port number at which the printer web pages will be served.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the port setting for the printer web pages. <b>Format:</b> ! U1 setvar "ip.http.port" "value" <b>Values:</b> "0" to "65535" <b>Default:</b> "80"
<b>getvar</b>	This command instructs the printer to respond with the current port setting for the printer web pages. <b>Format:</b> ! U1 getvar "ip.http.port"

**Example:** This **setvar** example shows the value set to "8080".

```
! U1 setvar "ip.http.enable" "8080"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.lpd.enable

This printer setting refers to the LPD (Line Printer Daemon) protocol setting.

**Important** • LPD communications from the host should be directed to port 515.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn LPD on or off.</p> <p><b>Format:</b> ! U1 setvar "ip.lpd.enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"off" = disables LPD protocol</li><li>"on" = enables LPD protocol</li></ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the LPD status.</p> <p><b>Format:</b> ! U1 getvar "ip.lpd.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

**! U1 setvar "ip.lpd.enable" "on"**

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mac\_raw

This command specifies the RAW MAC address of the wireless print server. The raw mac address is the mac address without the colons (":").

### getvar

Commands	Details
getvar	This command retrieves the RAW MAC address of the wireless print server. <b>Format:</b> ! U1 getvar "ip.mac_raw"

**Example:** In this example, the **getvar** retrieves the RAW MAC address of the wireless print server.

```
! U1 getvar "ip.mac_raw"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.appl\_path

**.17↑**

This command overrides the default location of the mirror application path ("appl" in "ip.mirror.path"). If the SGD is empty, the default path is used. If an error occurs retrieving application from path (i.e. path not found or application not there), the default path is NOT used. This path must be fully defined in relation to the mirror server root and is not relative to ip.mirror.path.

Commands	Details
<b>setvar</b>	<p>This command sets the path to the application on the mirror server.</p> <p><b>Format:</b> ! U1 setvar "ip.mirror.appl_path" "values"</p> <p><b>Values:</b> A valid application path (location)</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command retrieves the path to the application on the mirror server.</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.appl_path"</p>

**Example:** If the default value is used, the application would be copied from "ip.mirror.path"\appl

If you send ! U1 setvar "ip.mirror.appl\_path" "program\current" and "ip.mirror.path" has the value "c:\mirror", then the application would be copied from c:\mirror\program\current.

### Supported Devices

- iMz™ series
- QLn™ series
- ZT200™ series
- ZD500R™ series
- ZT400™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.auto

**.17↑**

This command enables the ability to automatically perform a mirror update (fetch) command on power up.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to perform a mirror update (fetch) command when the printer is turned on using the interval that is set for "ip.mirror.freq" or "ip.mirror.freq_hours".</p> <p><b>Format:</b> ! U1 setvar "ip.mirror.auto" "values"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on" = turns on the auto mirroring feature</li> <li>"off" = turns off the auto mirroring feature</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command will report whether the printer will perform a mirror update (fetch) automatically on power up.</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.auto"</p>

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "ip.mirror.auto" "off"
```

When the **setvar** value is set to "off", the **getvar** result is "off".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.error\_retry

.171

This command identifies how many times mirroring is retried when an error occurs.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the required times that mirroring retries when an error occurs. <b>Format:</b> ! U1 setvar "ip.mirror.error_retry" "value" <b>Values:</b> numeric values (0 - 65535) <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the number of times the printer retries mirroring when an error occurs. <b>Format:</b> ! U1 getvar "ip.mirror.error_retry"

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "ip.mirror.error_retry" "0"
```

When the **setvar** value is set to "0", the **getvar** result is "0".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.feedback.auto

**.171**

This command identifies if a feedback file is pushed to the mirroring server by the printer when a mirroring update (fetch) is complete.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the mirror feedback feature to on or off. <b>Format:</b> ! U1 setvar "ip.mirror.feedback.auto" "value" <b>Values:</b> "on" = turns on mirror feedback "off" = turns off mirror feedback <b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command retrieves the mirror feedback setting that the printer is currently using. <b>Format:</b> ! U1 getvar "ip.mirror.feedback.auto"</p>

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "ip.mirror.feedback.auto" "off"
```

When the **setvar** value is set to "off", the **getvar** result is "off".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.feedback.freq

.17↑

This command specifies the time interval (in minutes) between performing feedback file uploads.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the number of minutes to wait between feedback file uploads. <b>Format:</b> ! U1 setvar "ip.mirror.feedback.freq" "value" <b>Values:</b> numeric value (0 - 65535) <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the number of minutes set to wait between feedback file uploads. <b>Format:</b> ! U1 getvar "ip.mirror.feedback.freq"

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "ip.mirror.feedback.freq" "0"
```

.17↑

When the **setvar** value is set to "0", the **getvar** result is "0".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.feedback.odometer

.171

This command instructs the printer to set the mirror feedback odometer.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the odometer counter. <b>Format:</b> ! U1 setvar "ip.mirror.feedback.odometer" "values" <b>Values:</b> numeric value between 0 and 4294967295 <b>Default:</b> "0"
<b>getvar</b>	This command retrieves the mirror feedback odometer. <b>Format:</b> ! U1 getvar "ip.mirror.feedback.odometer"

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "ip.mirror.feedback.odometer" "0"
```

When the **setvar** value is set to "0", the **getvar** result is "0".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.feedback.path

.171

This command identifies where the feedback file is stored on the mirroring server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the path on the mirroring server that stores the feedback file.</p> <p><b>Format:</b> ! U1 setvar "ip.mirror.feedback.path" "value"</p> <p><b>Values:</b> alphanumeric text (1 to 50 characters)</p> <p><b>Default:</b> "Zebra/feedback"</p>
<b>getvar</b>	<p>This command retrieves the path on the mirroring sever that the printer is currently using to store the feedback file.</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.feedback.path"</p>

**Example:** This **setvar** example shows the value set to "Zebra/feedback".

! U1 setvar "ip.mirror.feedback.path" "Zebra/feedback"

When the **setvar** value is set to "Zebra/feedback", the **getvar** result is "Zebra/feedback".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.fetch

.17↑

This command forces a mirroring update sequence.

**setvar;do**

Commands	Details
setvar	This command forces a mirroring update sequence. <b>Format:</b> ! U1 setvar "ip.mirror.fetch" ""
do	This command forces a mirroring update sequence. <b>Format:</b> ! U1 do "ip.mirror.fetch" ""

**Example:** This **setvar** example forces a mirroring update sequence.

**! U1 setvar "ip.mirror.fetch" ""**

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.freq

.171

This command defines the frequency of mirroring updates (in minutes).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the mirror frequency.</p> <p><b>Format:</b> ! U1 setvar "ip.mirror.freq" "value"</p> <p><b>Values:</b> "0" through "65535" (minutes)</p> <p><b>Default:</b> "0" (disables this feature)</p> <p><b>Important •</b> When the "ip.mirror.freq" is set to a low value (other than zero) the printer will spend a lot of time performing the mirroring process.</p>
<b>getvar</b>	<p>This command retrieves the number of minutes to wait before performing another mirror update.</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.freq"</p>

**Example:** This **setvar** example shows the value set to "1000".

! U1 setvar "ip.mirror.freq" "1000"

When the **setvar** value is set to "1000", the **getvar** result is "1000" and mirroring will be attempted every 1000 minutes.

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.freq\_hours

**.171**

This command defines the frequency of mirroring updates (in hours).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the frequency of mirroring updates (in hours).</p> <p><b>Format:</b> ! U1 setvar "ip.mirror.freq_hours" "values"</p> <p><b>Values:</b> "0" through "100"</p> <p><b>Default:</b> "0" (disables this feature)</p>
<b>getvar</b>	<p>This command retrieves the frequency of mirroring updates (in hours) that the printer is currently using.</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.freq_hours"</p>

**Example:** This **setvar** example shows the value set to "8".

```
! U1 setvar "ip.mirror.freq_hours" "8"
```

When the **setvar** value is set to "8", the **getvar** result is "8" and mirroring will be attempted every 8 hours.

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# ip.mirror.interface

Determines the interface over which Mirror will operate.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "ip.mirror.interface" "value" <b>Values:</b> "both" = internal or external wired and WLAN "wired" = internal or external wired "wireless" = WLAN <b>Default:</b> "both"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "ip.mirror.interface"

## Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

## Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.last\_error

.171

This command retrieves the last error encountered during a mirroring operation.

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the error code of the last mirroring update (fetch). <b>Format:</b> ! U1 getvar "ip.mirror.last_error"

**Example:** In this example, the **getvar** retrieves the error code of the last mirroring update.

```
! U1 getvar "ip.mirror.last_error"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.last\_time

.171

This command retrieves the timestamp, in seconds, of the last time the system attempted a mirror update (fetch).

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the timestamp, in seconds, of the last time the system attempted a mirror update (fetch). <b>Format:</b> ! U1 getvar "ip.mirror.last_time"

**Example:** In this example, the **getvar** retrieves the timestamp, in seconds, of the last time the system attempted a mirror update.

**! U1 getvar "ip.mirror.last\_time"**

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.mode

**.17↑**

This command sets the protocol used to perform mirror tasks.

Commands	Details
<b>setvar</b>	<p>This command sets the protocol for mirror tasks.</p> <p><b>Format:</b> ! U1 setvar "ip.mirror.mode" "values"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>• <b>ftp</b> - FTP protocol will be used to perform mirror tasks</li> <li>• <b>sftp</b> - SFTP protocol will be used to perform mirror tasks</li> </ul> <p><b>Default:</b> "ftp"</p>
<b>getvar</b>	<p>This command retrieves the path to the application on the mirror server.</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.mode"</p>

### Supported Devices

- iMz™ series
- QLn™ series
- ZT200™ series
- ZD500R™ series
- ZT400™ series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.password

.171

This command specifies the user password on the mirroring server assigned for mirroring updates (fetch).

Commands	Details
<b>setvar</b>	This command instructs the printer to use a specific password for mirroring updates (fetch). <b>Format:</b> ! U1 setvar "ip.mirror.password" "value" <b>Values:</b> alphanumeric text string (1 to 20 characters) <b>Default:</b> "password"
<b>getvar</b>	This command retrieves the user password the printer is currently using for mirroring updates (fetch). <b>Format:</b> ! U1 getvar "ip.mirror.password"

**Example:** This **setvar** example shows the value set to "password".

**! U1 setvar "ip.mirror.password" "password"**

When the **setvar** value is set to "password", the **getvar** result is "\*". For security purposes, the printer does not return password information.

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.path

.171

This command identifies the base path on the FTP server where the mirror directory resides.

Commands	Details
<b>setvar</b>	This command sets the base path on the FTP server where the mirror directory resides. <b>Format:</b> ! U1 setvar "ip.mirror.path" "value" <b>Values:</b> alphanumeric text string (1 to 50 characters) <b>Default:</b> "zebra"
<b>getvar</b>	This command retrieves the base path of the FTP server where the mirror directory resides. <b>Format:</b> ! U1 getvar "ip.mirror.path"

**Example:** This **setvar** example shows the value set to "zebra".

```
! U1 setvar "ip.mirror.path" "zebra"
```

When the **setvar** value is set to "zebra", the **getvar** result is "zebra".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## ip.mirror.reset\_delay

**.171**

This command specifies the number of seconds between when the printer receives the last byte of the last file from the /commands directory and when the printer resets during a mirror event.

Commands	Details
<b>setvar</b>	<p>This command sets the number of seconds between when the printer receives the last byte of the last file from the /commands directory and when the printer resets during a mirror event.</p> <p><b>Format:</b> ! U1 setvar "ip.mirror.reset_delay" "value"</p> <p><b>Values:</b> 0 - 900 (seconds)</p> <p><b>Default:</b> "5"</p>  The default setting for the <b>ip.mirror.reset_delay</b> command is 5 seconds; in some cases it may be necessary to use a longer delay to allow for full processing of longer or more complex files.
<b>getvar</b>	<p>This command retrieves the number of seconds between when the printer receives the last byte of the last file from the /commands directory and when the printer resets during a mirror event.</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.reset_delay"</p>

**Example:** This **setvar** example shows the value set to "10".

```
! U1 setvar "ip.mirror.reset_delay" "10"
```

When the setvar value is set to "10", the getvar result is "10".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.server

.171

This command identifies the IP address of the mirroring server.

Commands	Details
<b>setvar</b>	This command sets the IP address of the mirroring server. <b>Format:</b> ! U1 setvar "ip.mirror.server" "value" <b>Values:</b> a valid IP address <b>Default:</b> "127.0.0.1"
<b>getvar</b>	This command retrieves the IP address of the mirroring server. <b>Format:</b> ! U1 getvar "ip.mirror.server"

**Example:** This **setvar** example shows the value set to "10.3.1.1".

**! U1 setvar "ip.mirror.server" "10.3.1.1"**

When the **setvar** value is set to "10.3.1.1", the **getvar** result is "10.3.1.1".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## ip.mirror.success

.171

This command reports the success or failure of the last mirroring update (fetch).

### getvar

Commands	Details
getvar	<p>This command retrieves the success or failure of the last mirroring update (fetch).</p> <p><b>Format:</b> ! U1 getvar "ip.mirror.success"</p> <p><b>Values:</b></p> <p>"yes" = successful "no" = unsuccessful</p>

**Example:** In this example, the **getvar** retrieves the success or failure of the last mirroring update (fetch).

```
! U1 getvar "ip.mirror.success"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.success\_time

.171

This command provides the timestamp, in seconds, of the last time the system successfully completed a mirror update (fetch).

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the timestamp, in seconds, of the last time the system successfully completed a mirror update (fetch). <b>Format:</b> ! U1 getvar "ip.mirror.success_time"

**Example:** In this example, the **getvar** retrieves the timestamp of the last time the system successfully completed a mirror update.

**! U1 getvar "ip.mirror.success\_time"**

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.username

.171

This command specifies the user name on the mirroring server assigned for mirroring updates (fetch).

Commands	Details
<b>setvar</b>	This command instructs the printer to use a specific user name for mirroring updates (fetch). <b>Format:</b> ! U1 setvar "ip.mirror.username" "value" <b>Values:</b> alphanumeric text string (1 to 20 characters) <b>Default:</b> "user"
<b>getvar</b>	This command retrieves the user name the printer is currently using for mirroring updates (fetch). <b>Format:</b> ! U1 getvar "ip.mirror.username"

**Example:** This **setvar** example shows the value set to "user".

```
! U1 setvar "ip.mirror.username" "user"
```

When the **setvar** value is set to "user", the **getvar** result is "user".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.mirror.version

.171

This command retrieves the mirror code build date.

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the mirror code build date. <b>Format:</b> ! U1 getvar "ip.mirror.version"

**Example:** In this example, the **getvar** retrieves the mirror code build date.

**! U1 getvar "ip.mirror.version"**

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.netmask

This setting refers to the subnet mask address. This value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the subnet mask. <b>Format:</b> ! U1 setvar "ip.netmask" "value" <b>Values:</b> Any valid subnet mask. <b>Default:</b> "255.255.255.0"
<b>getvar</b>	This command instructs the printer to respond with subnet mask. <b>Format:</b> ! U1 getvar "ip.netmask"

→ **Example:** This **setvar** example shows the value set to "255.255.255.0".

```
! U1 setvar "ip.netmask" "255.255.255.0"
```

When the **setvar** value is set to "255.255.255.0", the **getvar** result is "255.255.255.0".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.ntp.enable

Enables or disables the Network Time Protocol (NTP) feature.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "ip.ntp.enable" "value" <b>Values:</b> "on" = enabled "off" = disabled <b>Default:</b> "off"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "ip.ntp.enable"

### Supported Devices

- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.ntp.log

Retrieves the Network Time Protocol (NTP) status and error log. If NTP is not running this will return "File Not Found" for the error log.

Commands	Details
getvar	Format: ! U1 getvar "ip.ntp.log" Default: "File Not Found"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320, QLn420
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.ntp.servers

Sets the list of NTP (Network Time Protocol) servers which the printer will use to set the time.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "ip.ntp.servers" "value" <b>Values:</b> A comma delimited string of server name(s) or ip address(es), with a length of 0-1024 characters. <b>Default:</b> "" <b>Example:</b> ! U1 setvar "ip.ntp.servers" "0.us.pool.ntp.org,10.3.17.124"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "ip.ntp.servers" <b>Result:</b> A comma delimited string of server name(s) or ip address(es).

### Supported Devices

- QLn220, QLn320, QLn420
- ZQ510, ZQ520
- ZR638, ZR628
- ZT210, ZT220, ZT230

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.pop3.enable

This printer setting determines if the printer queries a POP3 mailbox for mail.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn POP3 on or off. <b>Format:</b> ! U1 setvar "ip.pop3.enable" "value" <b>Values:</b> "off" = disables POP3 "on" = enables POP3 <b>Default:</b> "on"
<b>getvar</b>	This command instructs the printer to respond with the POP3 status. <b>Format:</b> ! U1 getvar "ip.pop3.enable"

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.pop3.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.pop3.password

This printer setting refers to the POP3 mailbox password. This only applies if "ip.pop3.enable" is set to on.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the POP3 password.</p> <p><b>Format:</b> ! U1 setvar "ip.pop3.password" "value"</p> <p><b>Values:</b> A maximum of 20 alphanumeric characters</p> <p><b>Default:</b> " "</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the POP3 password.</p> <p><b>Format:</b> ! U1 getvar "ip.pop3.password"</p> <p>For protection a single "*" prints.</p>

**Example:** This **setvar** example shows the value set to "password".

```
! U1 setvar "ip.pop3.password" "password"
```

When the **setvar** value is set to "password", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## ip.pop3.poll

This printer setting refers to how frequent (in seconds) the printer queries a POP3 mailbox for new mail. This only applies if the "**ip.pop3.enable**" is set to on.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the POP3 poll interval. A value of "0" causes the printer to only query the POP3 mailbox one time, on printer power up, or following a network reset.</p> <p><b>Format:</b> ! U1 setvar "ip.pop3.poll" "value"</p> <p><b>Values:</b> "0" through "65535"</p> <p><b>Default:</b> "0"</p> <p> <b>Note •</b> A poll value of less than thirty seconds is not recommended. The printer is unresponsive for several seconds when polling for email depending on data transfer time from the server to the printer.</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the POP3 poll frequency (in seconds).</p> <p><b>Format:</b> ! U1 getvar "ip.pop3.poll"</p>

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "ip.pop3.poll" "0"
```

When the **setvar** value is set to "0", the **getvar** result is "0".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.pop3.server\_addr

This printer setting refers to the POP3 server IP address that the printer contacts when checking for new mail. This only applies if "**ip.pop3.enable**" is set to on.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the POP3 server address. <b>Format:</b> ! U1 setvar "ip.pop3.server_addr" "value" <b>Values:</b> Any valid POP3 server address <b>Default:</b> "0.0.0.0"
<b>getvar</b>	This command instructs the printer to respond with the POP3 server address. <b>Format:</b> ! U1 getvar "ip.pop3.server_addr"

**Example:** This **setvar** example shows the value set to "10.3.5.10".

```
! U1 setvar "ip.pop3.server_addr" "10.3.5.10"
```

When the **setvar** value is set to "10.3.5.10", the **getvar** result is "10.3.5.10".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## ip.pop3.username

This printer setting refers to the POP3 user name. This only applies if the "ip.pop3.enable" is set to on.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the POP3 user name. <b>Format:</b> ! U1 setvar "ip.pop3.username" "value" <b>Values:</b> A maximum of 20 alphanumeric characters <b>Default:</b> " "
<b>getvar</b>	This command instructs the printer to respond with the POP3 user name. <b>Format:</b> ! U1 getvar "ip.pop3.username"

**Example:** This **setvar** example shows the value set to "user".

```
! U1 setvar "ip.pop3.username" "user"
```

When the **setvar** value is set to "user", the **getvar** result is "user".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.port

This printer setting refers to the port number that the TCP print service is listening on. Normal TCP communications from the host should be directed to this port.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the TCP/UDP port number. <b>Format:</b> ! U1 setvar "ip.port" "value" <b>Values:</b> 1 - 65535 (excluding any ports currently used by other services, such as 21, 23, 80, and 515). <b>Default:</b> "9100"
<b>getvar</b>	This command instructs the printer to respond with the TCP/UDP port number. <b>Format:</b> ! U1 getvar "ip.port"

**Example:** This **setvar** example shows the value set to "9100".

```
! U1 setvar "ip.port" "9100"
```

When the **setvar** value is set to "9100", the **getvar** result is "9100".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.port\_alternate

This command sets the port number of the alternate port.

**Note •** Print servers supporting this command will monitor both the primary port and the alternate port for connections at the same time.

Commands	Details
<b>setvar</b>	This command sets the alternate port for the print server. <b>Format:</b> ! U1 setvar "ip.port_alternate" "value" <b>Values:</b> Any valid TCP port address. <b>Default:</b> "9100"
<b>getvar</b>	This command returns the current alternate port setting. <b>Format:</b> ! U1 getvar "ip.port_alternate" <b>Values:</b> The current port setting.

**Example:** This **setvar** example shows the value set to "6101".

```
U1 setvar "ip.port_alternate" "6101"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.port\_json\_config

This printer setting refers to the port number that the TCP print service is listening on for JSON configuration packets. JSON TCP communications from the host should be directed to this port.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the JSON TCP port number.</p> <p><b>Format:</b> ! U1 setvar "ip.port_json_config" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>0 = Disable the port</li> <li>1 - 65535 (excluding any ports currently used by other services, such as 21, 23, 80, and 515).</li> </ul> <p><b>Default:</b> "9200"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the JSON TCP port number.</p> <p><b>Format:</b> ! U1 getvar "ip.port_json_config"</p>

**Example:** This **setvar** example shows the value set to "9200".

```
! U1 setvar "ip.port_json_config" "9200"
```

When the **setvar** value is set to "9200", the **getvar** result is "9200".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.port\_single\_conn

This command configures the port number for the single connection IP port. The single-connection IP port allows only one connection at a time.

See "ip.port\_single\_conn\_idle\_timeout" for additional information.

Commands	Details
<b>setvar</b>	<b>Format:</b> ! U1 setvar "ip.port_single_conn" "value" <b>Values:</b> A number between 1 and 65535. This number specifies the port. <b>Default:</b> "9300"
<b>getvar</b>	<b>Format:</b> ! U1 getvar "ip.port_single_conn" <b>Result:</b> A port number between 1 and 65535.

### Supported Devices

- iMZ220, iM320
- QLn320, QLn220
- ZD410, ZD420
- ZD500, ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.port\_single\_conn\_idle\_timeout

Sets the amount of time that must elapse with no activity for the single-connection IP port to be considered in the idle state.

When the port is idle and a new connection is requested, the currently open connection will be closed and a new connection will be opened. If the port is not in the idle state, the current connection will be maintained and the connection request will be refused with an error response.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "ip.port_single_conn_idle_timeout" "value" <b>Values:</b> A number between 1 and 65535. The value is in seconds. If the value is 0, the port will be considered to be in the idle state. <b>Default:</b> "180"
getvar	<b>Format:</b> ! U1 getvar "ip.port_single_conn_idle_timeout" <b>Result:</b> A number between 1 and 65535. The value is in seconds. If the value is 0, the port will be considered to be in the idle state.

### Supported Devices

- iMZ220, iM320
- QLn320, QLn220
- ZD410, ZD420
- ZD500, ZQ510, ZQ520
- ZR638, ZR628
- ZT230, ZT220, ZT210
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.primary\_network

This command allows you to set the primary network to either wired or wireless.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the primary network device.</p> <p><b>Format:</b> ! U1 setvar "ip.primary_network" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>1 = wired</li><li>2 = wireless</li></ul> <p><b>Default:</b> "1"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the name of the current primary network device.</p> <p><b>Format:</b> ! U1 getvar "ip.primary_network"</p>

**Example:** This **setvar** example shows the value set to "1".

```
! U1 setvar "ip.primary_network" "1"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "1".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## ip.smtp.domain

This printer setting refers to the domain name used by the printer in sending email with respect to the SMTP server.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the SMTP domain name. <b>Format:</b> ! U1 setvar "ip.smtp.domain" "value" <b>Values:</b> A maximum of 24 alphanumeric characters <b>Default:</b> "ZBRPrintServer"
<b>getvar</b>	This command instructs the printer to return the SMTP domain name. <b>Format:</b> ! U1 getvar "ip.smtp.domain"

→ **Example:** This **setvar** example shows the value set to "ZBRPrintServer.com".

```
! U1 setvar "ip.smtp.domain" "ZBRPrintServer.com"
```

When the **setvar** value is set to "ZBRPrintServer.com", the **getvar** result is "ZBRPrintServer.com".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.smtp.enable

This printer setting refers to the SMTP protocol.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn SMTP on or off. <b>Format:</b> ! U1 setvar "ip.smtp.enable" "value" <b>Values:</b> "off" = disables SMTP "on" = enables SMTP <b>Default:</b> "on"
<b>getvar</b>	This command instructs the printer to return the SMTP status. <b>Format:</b> ! U1 getvar "ip.smtp.enable"

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.smtp.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.smtp.server\_addr

This printer setting refers to the IP address of the SMTP server used for sending email.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the SMTP server address. <b>Format:</b> ! U1 setvar "ip.smtp.server_addr" "value" <b>Values:</b> Any valid IP address. <b>Default:</b> 0.0.0.0
<b>getvar</b>	This command instructs the printer to respond with the current SMTP server address. <b>Format:</b> ! U1 getvar "ip.smtp.server_addr"

**Example:** This **setvar** example shows the value set to **10.10.10.10**.

```
! U1 setvar "ip.smtp.server_addr" "10.10.10.10"
```

When the **setvar** value is set to "**10.10.10.10**", the **getvar** result is "**10.10.10.10**".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.snmp.get\_community\_name

This printer setting is used when making SNMP queries. The SNMP client must supply the get community name that matches the printer's get community name in order to query any SNMP data.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the SNMP get community name string. <b>Format:</b> <code>! U1 setvar "ip.snmp.get_community_name" "value"</code> <b>Values:</b> A maximum of 19 alphanumeric characters. <b>Default:</b> "public"
<b>getvar</b>	This command instructs the printer to get the SNMP get community name string. <b>Format:</b> <code>! U1 getvar "ip.snmp.get_community_name"</code> For protection a single "*" prints.

**Example:** This **setvar** example shows the value set to "public".

```
! U1 setvar "ip.snmp.get_community_name" "public"
```

When the **setvar** value is set to "public", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.snmp.set\_community\_name

This printer setting is used when changing SNMP data remotely. To alter any SNMP data, the SNMP client must supply the set community name that matches the printer's set community name.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the SNMP set community name string. <b>Format:</b> ! U1 setvar "ip.snmp.set_community_name" "value" <b>Values:</b> A maximum of 19 alphanumeric characters <b>Default:</b> "public"
<b>getvar</b>	This command instructs the printer to return the printer's SNMP set community name string. <b>Format:</b> ! U1 getvar "ip.snmp.set_community_name" For protection a single "*" returns.

**Example:** This **setvar** example shows the value set to "public".

```
! U1 setvar "ip.snmp.set_community_name" "public"
```

When the **setvar** value is set to "public", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.snmp.trap\_community\_name

This command sets the SNMP Trap Community name of the print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the SNMP trap community name. <b>Format:</b> ! U1 setvar "ip.snmp.get_community_name" "value" <b>Values:</b> A maximum of 20 alphanumeric characters. <b>Default:</b> "public"
<b>getvar</b>	This command instructs the printer to get the SNMP trap community name. <b>Format:</b> ! U1 getvar "ip.snmp.trap_community_name"

### Example:

```
! U1 setvar "ip.snmp.trap_community_name" "public"
```

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.snmp.enable

This printer setting refers to the SNMP protocol.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to enable or disable the SNMP protocol. <b>Format:</b> ! U1 setvar "ip.snmp.enable" "value" <b>Values:</b> "on" = enable the SNMP protocol "off" = disable the SNMP protocol <b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the SNMP status. <b>Format:</b> ! U1 getvar "ip.snmp.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.snmp.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.tcp.enable

This printer setting refers to the TCP socket protocol.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn the TCP on or off. <b>Format:</b> ! U1 setvar "ip.tcp.enable" "value" <b>Values:</b> "off" = disables TCP protocol "on" = enables TCP protocol <b>Default:</b> "on"
<b>getvar</b>	This command instructs the printer to respond with the TCP status. <b>Format:</b> ! U1 getvar "ip.tcp.enable"

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.tcp.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.telnet.enable

This printer setting refers to the TELNET (port 23) protocol.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn TELNET on or off.  <b>Format:</b> ! U1 setvar "ip.telnet.enable" "value"  <b>Values:</b>          "off" = disables telnet protocol          "on" = enables telnet protocol  <b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the TELNET status.  <b>Format:</b> ! U1 getvar "ip.telnet.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.telnet.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.tcp.nagle\_algorithm

Enables or disables the use of the Nagle algorithm on TCP connections.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "ip.tcp.nagle_algorithm" "value" <b>Values:</b> "enabled" = allows the use of the Nagle algorithm "disabled" = disables use of the Nagle algorithm <b>Default:</b> "enabled"
getvar	<b>Format:</b> ! U1 getvar "ip.tcp.nagle_algorithm"

### Supported Devices

- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR628, ZR638
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## ip.udp.enable

This printer setting refers to the UDP socket protocol.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn UDP on or off. <b>Format:</b> ! U1 setvar "ip.udp.enable" "value" <b>Values:</b> "off" = disables UDP protocol "on" = enables UDP protocol <b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the UDP status. <b>Format:</b> ! U1 getvar "ip.udp.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "ip.udp.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].num\_connections

This command reports the number of established connections on conn1 and conn2. Once the connection is established, this number will be incremented. When a channel is closed or the connection times out, the number is decremented..

### Supported Devices

- iMz™ series
- QLn™ series
- ZT200™ series
- ZD500R™ series

Type `getvar`

Commands	Details
<code>getvar</code>	<p>This command retrieves the number of active connections on conn1 and conn2.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"><li>• <code>! U1 getvar "weblink.ip.conn1.num_connections"</code></li><li>• <code>! U1 getvar "weblink.ip.conn2.num_connections"</code></li></ul>

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.enable

This command indicates if one or more of the weblink connections are active.

If there is more than one connection under the weblink branch (for example, **weblink.ip.conn1**) and if any of the **.location** values are set, then this SGD will be set to "on". If all connections are disabled (all connection **.location** values set to ""), then this value will be set to "off".

**^JUF**, **^JUS**, **^JUN**, **^JUA**, and **device.restore\_defaults** do not have any affect on this setting.

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

**Type** **getvar**

Commands	Details
<b>getvar</b>	<p>This command indicates if one or more of the weblink connections are active.</p> <p><b>Format:</b> ! U1 getvar "weblink.enable"</p> <p><b>Result:</b></p> <ul style="list-style-type: none"><li>• "yes" if any of the .location values are set</li><li>• "off" if all connections are disabled</li></ul>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].authentication.add

This command allows the user to add a single server/username/password triplet into the list of authentication entries.

When the printer attempts to connect to the server (url specified in **weblink.ip.conn[1|2].location**) the server may require HTTP authentication (e.g. digest, basic, DNS, etc.). There may be multiple authentication requests along the route to the destination (e.g. a local server first requires HTTP authentication as well as on the remote server).

For each HTTP authentication request received while attempting to connect, the printer will enumerate the authentication entries and attempt to satisfy the request with the username/password pair provided for the respective server. The server name in the entry is what determines which username/password pair should be used for which authentication request. Both DNS names and IP addresses are acceptable. The server, username, and password are separated by a single space (not a tab or other white space character). The server name is the only required field. If no username is supplied, but a password is, there must be two spaces between the server and the password fields. If there is a username but no password, or simply just theservername, no space is required at the end of the entry.

If the command is changed when the connection is enabled (**weblink.enable is set to "on"**), it will not take effect until the connection is disabled, and then re-enabled.

**Important** • This setting only be changed when **weblink.enable** is set to "off".

**^JUF**, **^JUS**, **^JUN**, **^JUA**, and **device.restore\_defaults** do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type **setvar**

Commands	Details
<b>setvar</b>	<p>This command adds a single server/username/password triplet to the list of authentication entries.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.authentication.add" "servername[username][ password]"</li> <li>• ! U1 setvar "weblink.ip.conn2.authentication.add" "servername[username][ password]"</li> </ul> <p><b>Values:</b> servername [username][ password] has a maximum length of string is 2048 characters</p> <p><b>Default:</b> NA</p>

- **Example 1:** In this example, a username and a password is supplied:  
! U1 setvar "weblink.ip.conn1.authentication.add" "my.server.lan  
johndoe password"
- Example 2:** In this example, no password is supplied  
! U1 setvar "weblink.ip.conn1.authentication.add" "my.server.lan  
johndoe"
- Example 3:** In this example, no username is supplied (note the double space)  
! U1 setvar "weblink.ip.conn1.authentication.add"  
"my.server.lan password"
- Example 4:** In this example, no username or password is supplied  
! U1 setvar "weblink.ip.conn1.authentication.add" "my.server.lan"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# weblink.ip.conn[1|2].authentication.entries

This command lists the server names added to the authentication entries list.

Only the server names will be shown. The username and passwords will not be shown. The server names are separated by a \r\n so that each shows up on its own line.

**^JUF**, **^JUS**, **^JUN**, **^JUA**, and **device.restore\_defaults** do not have any affect on this setting.

## Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type **getvar**

Commands	Details
<b>getvar</b>	This command lists the server names for the specified connection. <b>Format:</b> <ul style="list-style-type: none"><li>• ! U1 getvar "weblink.ip.conn1.authentication.entries"</li><li>• ! U1 getvar "weblink.ip.conn2.authentication.entries"</li></ul>

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].authentication.remove

This command allows the user to remove a single server/username/password triplet from the list of authentication entries.

To remove an entry only the server name is supplied. If an invalid entry is supplied no action is taken. If the SGD is changed when the connection is enabled (`weblink.ip.conn[1|2].enable`), it will not take effect until the connection is disabled, and then re-enabled. It is therefore recommended that this setting only be changed when `weblink.ip.conn[1|2].enable` is set to "off".

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar`

Commands	Details
<code>setvar</code>	<p>This command removes a single server/username/password triplet from the list of authentication entries.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.authentication.remove" "servername"</li> <li>• ! U1 setvar "weblink.ip.conn2.authentication.remove" "servername"</li> </ul> <p><b>Values:</b> servername has a maximum length of string is 2048 characters.</p> <p><b>Default:</b> NA</p>

**Example:** In this example, a username and a password is supplied

```
! U1 setvar "weblink.ip.conn1.authentication.remove"
"my.server.lan"
```

## weblink.ip.conn[1|2].location

This command assigns the URL of the server for this connection. The URL must follow the URL rules for the HTTP[S] protocol outlined in RFC2396 (<http://www.ietf.org/rfc/rfc2396.txt>).

The setting will not take effect until the printer is reset. Changing this setting will set weblink.printer\_reset\_required to "yes".

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMz™ series
- QLn™ series
- ZT200™ series
- ZD500R™ series

Type `setvar`, `getvar`

Commands	Details
<b>setvar</b>	<p>This command sets the server URL for the specified connection.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.location" "value"</li> <li>• ! U1 setvar "weblink.ip.conn2.location" "value"</li> </ul> <p><b>Values:</b> any HTTPS URL up to 2048 characters</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command returns the server URL currently assigned to the connection.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 getvar "weblink.ip.conn1.location"</li> <li>• ! U1 getvar "weblink.ip.conn2.location"</li> </ul>

### Example:

```
! U1 setvar "weblink.ip.conn2.location"
"https://my.linkos.server.com:8080/link/os"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].maximum\_simultaneous\_connections

This command indicates the maximum number of simultaneous connections that can be initiated by the printer.

Via the main connection (the original connection initiated by the printer to the remote server), the remote server can request that additional connections from the printer be initiated (e.g. a connection that supports only JSON SGDs, one that behaves similar to the RAW TCP port).

The server is free to request as many as it thinks it needs, but the printer will prevent more than N number of connections, where N is the value of this command.

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar`, `getvar`

Commands	Details
<code>setvar</code>	<p>This command sets the maximum number of connections.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.maximum_simultaneous_connections" "value"</li> <li>• ! U1 setvar "weblink.ip.conn2.maximum_simultaneous_connections" "value"</li> </ul> <p><b>Values:</b> Any integer from 1-100  <b>Default:</b> "10"</p>
<code>getvar</code>	<p>This command retrieves the maximum set number of connections.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 getvar "weblink.ip.conn1.maximum_simultaneous_connections"</li> <li>• ! U1 getvar "weblink.ip.conn2.maximum_simultaneous_connections"</li> </ul>

**Example:** This example sets the conn1 maximum connections to 3.

```
! U1 setvar "weblink.ip.conn1.maximum_simultaneous_connections" "3"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# weblink.ip.conn[1|2].proxy

This command assigns the URL of the proxy for the connection.

The proxy server protocol, port, domain, username, and password are all encoded into the URL via the format outlined in RFC2396 (<http://www.ietf.org/rfc/rfc2396.txt>).

The username and password must avoid the invalid characters listed in RFC2396 (e.g. ':', '@', '/', etc). If an invalid character must be used it needs to be escaped using '%' as described in RFC2396.

**^JUF**, **^JUS**, **^JUN**, **^JUA**, and **device.restore\_defaults** do not have any affect on this setting.

## Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type **setvar**, **getvar**, **do**

Commands	Details
<b>setvar</b>	<p>This command assigns the URL of the connection proxy.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.proxy" "url"</li> <li>• ! U1 setvar "weblink.ip.conn2.proxy" "url"</li> </ul> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>• Any valid URL up to 2048 characters</li> <li>• Expected URL format: [http https]://[user:pass@]domain[:port]/[path]</li> <li>• The URL will need to be built according to the server/proxy environment the printer is running within.</li> </ul> <p><b>Default:</b> ""</p> <ul style="list-style-type: none"> <li>• The user:pass, port, and path are all optional.</li> <li>• The default scheme must be either <b>HTTPS</b> or <b>HTTP</b>. The default is <b>HTTP</b>.</li> <li>• The default port is 1080.</li> <li>• The default is to omit the username and password.</li> </ul>
<b>getvar</b>	<p>This command retrieves the URL of the connection proxy.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 getvar "weblink.ip.conn1.proxy"</li> <li>• ! U1 getvar "weblink.ip.conn2.proxy"</li> </ul>

Commands	Details
do	<p>This command assigns the URL of the connection proxy.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"><li>• ! U1 do "weblink.ip.conn1.proxy" "url"</li><li>• ! U1 do "weblink.ip.conn2.proxy" "url"</li></ul> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>• Any valid URL up to 2048 characters</li><li>• Expected URL format: [scheme://][user:pass@]domain[:port]/[path]</li><li>• The URL will need to be built according to the server/proxy environment the printer is running within.</li></ul> <p><b>Default: ""</b></p> <ul style="list-style-type: none"><li>• The scheme, user:pass, port, and path are all optional.</li><li>• The default scheme is http.</li><li>• The default port is 1080.</li><li>• The default is to omit the username and password.</li></ul>

**Example:** Examples of how to connect to various proxy servers:

http://username:password@mydomain.com:3128/  
http://mydomain.com/

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].retry\_interval

This command sets the number of seconds between attempts to connect to the server URL provided in `weblink.ip.conn1.location`. If an attempt is unsuccessful or the connection is lost, the printer will wait '`retry_interval`' seconds before attempting to connect again.

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar`, `getvar`, `do`

Commands	Details
<code>setvar</code>	<p>This command sets the number of seconds to wait before attempting to reconnect to the server.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.retry_interval" "value"</li> <li>• ! U1 setvar "weblink.ip.conn2.retry_interval" "value"</li> </ul> <p><b>Values:</b> 1 - 600</p> <p><b>Default:</b> "10"</p>
<code>getvar</code>	<p>This command returns the number of seconds to wait between connection attempts.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 getvar "weblink.ip.conn1.retry_interval"</li> <li>• ! U1 getvar "weblink.ip.conn2.retry_interval"</li> </ul>
<code>do</code>	<p>This command sets the number of seconds to wait before attempting to reconnect to the server.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 do "weblink.ip.conn1.retry_interval" "value"</li> <li>• ! U1 do "weblink.ip.conn2.retry_interval" "value"</li> </ul> <p><b>Values:</b> 1 - 600</p> <p><b>Default:</b> "10"</p>

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].test.location

This command holds the URL for testing a connection to the internet. This is meant to assist users in debugging their printer's connection to remote servers when there are issues with the main weblink connection (conn1 or conn2).

The URL must follow the URL rules for the HTTP[S] protocol outlined in RFC2396 (<http://www.ietf.org/rfc/rfc2396.txt>).

**^JUF**, **^JUS**, **^JUN**, **^JUA**, and **device.restore\_defaults** do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type **setvar**, **getvar**, **do**

Commands	Details
<b>setvar</b>	<p>This command sets the URL to hold for testing a connection.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.test.location" "url"</li> <li>• ! U1 setvar "weblink.ip.conn2.test.location" "url"</li> </ul> <p><b>Values:</b> Any HTTPS URL up to 2048 characters</p> <p><b>Default:</b> "<a href="http://www.zebra.com/apps/linktest">http://www.zebra.com/apps/linktest</a>"</p>
<b>getvar</b>	<p>This command retrieves the printer's test connection URL.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 getvar "weblink.ip.conn1.test.location"</li> <li>• ! U1 getvar "weblink.ip.conn2.test.location"</li> </ul>
<b>do</b>	<p>This command sets the URL to hold for testing a connection.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 do "weblink.ip.conn1.test.location" "url"</li> <li>• ! U1 do "weblink.ip.conn2.test.location" "url"</li> </ul> <p><b>Values:</b> Any HTTPS URL up to 2048 characters</p> <p><b>Default:</b> "<a href="http://www.zebra.com/apps/linktest">http://www.zebra.com/apps/linktest</a>"</p>

**Example:** The test connection can assist the user in several ways/scenarios:

1. If the **test.test\_on** value is set to "**failure**", any time the main weblink (**conn[1|2].location**) connection fails to connect then the **test.location** URL will be used. In this situation, an attempt will be made to contact the remote URL in **test.location**, using authentication and proxy configuration that is specified by the main connection.
2. If the **test.test\_on** value is set to "**interval**" an attempt will be made to contact the remote URL in **test.location** every **test.retry\_interval** seconds, using authentication and proxy configuration that is specified by the main connection.
3. If the **test.test\_on** value is set to "**both**", then scenario 1 and 2 will both occur. This is useful for users who will use an HTTP connection to move through their firewall - and thereafter frequently refresh the connection to indicate to their firewall that there is still activity for the purpose of keeping the connection alive.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].test.retry\_interval

This command determines how often, in seconds, a connection to the test.location URL should be attempted. This setting is only applicable when the **test.test\_on** SGD is set to "interval" or "both".

**^JUF**, **^JUS**, **^JUN**, **^JUA**, and **device.restore\_defaults** do not have any affect on this setting.

### Supported Devices

- iMZ 220<sup>TM</sup>, iMZ 320<sup>TM</sup>
- QLn220<sup>TM</sup>, QLn320<sup>TM</sup>, QLn420<sup>TM</sup>
- ZT210<sup>TM</sup>, ZT220<sup>TM</sup>, ZT230<sup>TM</sup>

Type **setvar**, **getvar**, **do**

Commands	Details
<b>setvar</b>	<p>This command sets the interval for how often a connection to the test.location URL should be attempted.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 setvar "weblink.ip.conn1.test.retry_interval" "value"</li> <li>• ! U1 setvar "weblink.ip.conn2.test.retry_interval" "value"</li> </ul> <p><b>Values:</b> 0-1800 (in seconds, providing 0 second - 30 minute interval)</p> <p><b>Default:</b> "900"</p>
<b>getvar</b>	<p>This command retrieves the retry interval.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 getvar "weblink.ip.conn1.test.retry_interval"</li> <li>• ! U1 getvar "weblink.ip.conn2.test.retry_interval"</li> </ul>
<b>do</b>	<p>This command sets the interval for how often a connection to the test.location URL should be attempted.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• ! U1 do "weblink.ip.conn1.test.retry_interval" "value"</li> <li>• ! U1 do "weblink.ip.conn2.test.retry_interval" "value"</li> </ul> <p><b>Values:</b> 0-1800</p> <p><b>Default:</b> "900"</p>

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.ip.conn[1|2].test.test\_on

This command determines when the test connection should be attempted. This assists in debugging the printer's connection to remote servers when there are issues with the main weblink connection (conn1 or conn2).

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar`, `getvar`, `do`

Commands	Details
<code>setvar</code>	<p>This command indicate when the test connection should be attempted.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• <code>! U1 setvar "weblink.ip.conn1.test.test_on" "value"</code></li> <li>• <code>! U1 setvar "weblink.ip.conn2.test.test_on" "value"</code></li> </ul> <p><b>Values:</b> <code>off,failure,interval,both</code></p> <p><b>Default:</b> <code>"failure"</code></p>
<code>getvar</code>	<p>This command retrieves the test connection setting.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• <code>! U1 getvar "weblink.ip.conn1.test.test_on"</code></li> <li>• <code>! U1 getvar "weblink.ip.conn2.test.test_on"</code></li> </ul>
<code>do</code>	<p>This command sets when the test connection should be attempted.</p> <p><b>Format:</b></p> <ul style="list-style-type: none"> <li>• <code>! U1 do "weblink.ip.conn1.test.test_on" "value"</code></li> <li>• <code>! U1 do "weblink.ip.conn2.test.test_on" "value"</code></li> </ul> <p><b>Values:</b> <code>off,failure,interval,both</code></p> <p><b>Default:</b> <code>"failure"</code></p>

- **Example:** The test connection can assist the user in several ways/scenarios:
1. If the **test.test\_on** value is set to "**failure**", any time the main weblink (**conn[1|2].location**) connection fails to connect then the **test.location** URL will be used. An attempt will be made to contact the remote URL in **test.location**, using authentication and proxy configuration that is specified by the main connection.
  2. If the **test.test\_on** value is set to "**interval**" an attempt will be made to contact the remote URL in **test.location** every **test.retry\_interval** seconds, using authentication and proxy configuration that is specified by the main connection.
  3. If the **test.test\_on** value is set to "**both**", then scenario 1 and 2 will both occur. This is useful for users who will use an HTTP connection to move through their firewall - and thereafter frequently refresh the connection to indicate to their firewall that there is still activity for the purpose of keeping the connection alive.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.logging.clear

This command clears the weblink log. Setting this value to anything will clear it, including an empty string.

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar`, `do`

Commands	Details
<b>setvar</b>	This command clears the weblink log entires. <b>Format:</b> <code>! U1 setvar "weblink.logging.clear" "value"</code> <b>Values:</b> Any string value, including an empty string. <b>Default:</b> NA
<b>do</b>	This command clears the weblink log entires. <b>Format:</b> <code>! U1 do "weblink.logging.clear" "value"</code> <b>Values:</b> Any string value, including an empty string. <b>Default:</b> NA

**Example:** This example clears the weblink log entries with an empty string value.

```
! U1 setvar "weblink.logging.clear" ""
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.logging.entries

This command returns the N number of entries in the weblink log, where N has a maximum value that is set by `weblink.logging.max_entries`.

The weblink log is a collection of events related to connecting to a remote Link-OS™ server. The log entries range anywhere from general status to errors that prevented a successful connection. The log contains entries from all connections and are labeled so that it is clear which log entries are for which connection. Each log entry also contains a timestamp for when it was logged by the system. The newest events will appear at the bottom of the list.

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

### Type getvar

Commands	Details
<code>getvar</code>	<p>This command returns a lists of entries in the weblink log.</p> <p><b>Format:</b> ! U1 getvar "weblink.logging.entries"</p> <p><b>Values:</b> NA</p> <p><b>Default:</b> ""</p>

**Example:** This example shows the result from `weblink.logging.entries`:

```
[01-04-2013 08:40:45.655] [conn1.1] HTTP/1.1 404 Not Found
[01-04-2013 08:40:45.659] [conn1.1] Received HTTP code 404 from proxy
after CONNECT
[01-04-2013 08:40:45.660] [conn1.1] Closing connection
[01-04-2013 08:40:45.662] [conn1.1] Failed to connect (SP = 0, CU =
0, UW = 0, AC = 0, PC = 0)
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.logging.max\_entries

This command specifies the maximum number of individual log entries that will be stored in the `weblink.logging.entries` command.

**Important** • Changes to this command are immediate and may result in some log entries being lost. If there are N log entries currently in the log, the user sets the max\_entries to M, where M is less than N, the oldest (N-M) log entries will be removed.

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar`, `getvar`, `do`

Commands	Details
<b>setvar</b>	<p>This command sets the maximum number of log entries that will be stored.</p> <p><b>Format:</b> ! U1 setvar "weblink.logging.max_entries" "value"</p> <p><b>Values:</b> 0 - 10000</p> <p><b>Note</b> • Setting the value to 0 disables logging.</p> <p><b>Default:</b> "0"</p>
<b>getvar</b>	<p>This command returns the setting for the maximum number of log entries that will be stored.</p> <p><b>Format:</b> ! U1 getvar "weblink.logging.max_entries"</p>
<b>do</b>	<p>This command sets the maximum number of log entries that will be stored.</p> <p><b>Format:</b> ! U1 do "weblink.logging.max_entries" "value"</p> <p><b>Values:</b> 0 - 10000</p> <p><b>Note</b> • Setting the value to 0 disables logging.</p> <p><b>Default:</b> "0"</p>

→ **Example 1:** In this example, `weblink.logging.max_entries` is set to 3:

```
[01-04-2013 08:40:45.659] [conn1.1] Received HTTP code 404 from proxy after CONNECT
[01-04-2013 08:40:45.660] [conn1.1] Closing connection
[01-04-2013 08:40:45.662] [conn1.1] Failed to connect (SP = 0, CU = 0, UW = 0, AC = 0, PC = 0)
```

**Example 2:** In this example, `weblink.logging.max_entries` is set to 2:  
`weblink.logging.entries` becomes:

```
[01-04-2013 08:40:45.660] [conn1.1] Closing connection
[01-04-2013 08:40:45.662] [conn1.1] Failed to connect (SP = 0, CU = 0, UW = 0, AC = 0, PC = 0)
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.printer\_reset\_required

This command retrieves a "yes" or "no" value indicating whether any of the weblink settings have been modified.

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `getvar`

Commands	Details
<code>getvar</code>	This command retrieves whether any of the weblink settings are modified. <b>Format:</b> ! U1 getvar "weblink.printer_reset_required" <b>Values:</b> "yes" or "no" <b>Default:</b> "no"

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## weblink.restore\_defaults

This command defaults, and saves, the weblink branch settings. Any value, including an empty string, will default the weblink branch settings.

**Note** • The entire weblink branch of settings will be defaulted and the settings are saved; however, the weblink connections will not use the new settings until the printer is restarted (e.g. the `weblink.printer_reset_required` SGD will be "yes" after a default).

`^JUF`, `^JUS`, `^JUN`, `^JUA`, and `device.restore_defaults` do not have any affect on this setting.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar`, `do`

Commands	Details
<b>setvar</b>	<p>This command defaults the weblink branch settings.</p> <p><b>Format:</b> ! U1 setvar "weblink.restore_defaults" "value"</p> <p><b>Values:</b> Any value, including an empty string, will default the branch</p> <p><b>Default:</b> NA</p>
<b>do</b>	<p>This command defaults the weblink branch settings.</p> <p><b>Format:</b> ! U1 do "weblink.restore_defaults" "value"</p> <p><b>Values:</b> Any value, including an empty string, will default the branch</p> <p><b>Default:</b> NA</p>

**Example:** These all default the branch:

```
! U1 setvar "weblink.restore_defaults" ""
! U1 setvar "weblink.restore_defaults" "foo"
! U1 do "weblink.restore_defaults" ""
! U1 do "weblink.restore_defaults" "foo"
```

### Note

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.11n.20mhz\_only

This command forces 20 MHz operation only in printers with 802.11n radios.

Commands	Details
<b>setvar</b>	This command forces 20 MHz operation only in printers with 802.11n radios. <b>Format:</b> ! U1 setvar "wlan.11n.20mhz_only" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	This command returns the current setting for 20 MHz operation only. <b>Format:</b> ! U1 getvar "wlan.11n.20mhz_only"

### Example:

```
U1 setvar "wlan.11n.20mhz_only" "on"
```

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.11n.aggregation

This command enable or disables Aggregation MAC Service Data Unit (A-MSDU) in 802.11n radio communications.

Commands	Details
<b>setvar</b>	This command enables or disables A-MSDU in 802.11n radio communications. <b>Format:</b> ! U1 setvar "wlan.11n.aggregation" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	This command returns the current setting for A-MSDU. <b>Format:</b> ! U1 getvar "wlan.11n.aggregation"

### Example:

```
U1 setvar "wlan.11n.aggregation" "on"
```

### Supported Devices ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.11n.greenfield

This command will enable or disable greenfield mode in 802.11n radio communications.

Commands	Details
<b>setvar</b>	This command enables/disables greenfield mode. <b>Format:</b> ! U1 setvar "wlan.11n.greenfield" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	This command returns the current setting for greenfield mode. <b>Format:</b> ! U1 getvar "wlan.11n.greenfield"

### Example:

```
U1 setvar "wlan.11n.greenfield" "on"
```

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.11n.rifs

This command enable/disables Reduced Interframe Space (RIFS) in 802.11n radio communications.

Commands	Details
<b>setvar</b>	This command enable/disables RIFS in 802.11n. <b>Format:</b> ! U1 setvar "wlan.11n.rifs" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	This command returns the current setting for RIFS. <b>Format:</b> ! U1 getvar "wlan.11n.rifs"

### Example:

```
U1 setvar "wlan.11n.rifs" "on"
```

### Supported Devices ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.11n.short\_gi\_40mhz

This command enables/disables short Guard Interval in 40 mhz mode.

Commands	Details
<b>setvar</b>	This command enables/disables short Guard Interval in 40 mhz mode. <b>Format:</b> ! U1 setvar "wlan.11n.short_gi_40mhz" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	This command returns the current setting for short Guard Interval 40mhz operation. <b>Format:</b> ! U1 getvar "wlan.11n.short_gi_40mhz"

### Example:

```
U1 setvar "wlan.11n.short_gi_40mhz" "on"
```

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.11n.short\_gi\_20mhz

This command enables/disables short Guard Interval (GI) in 20 mhz mode.

Commands	Details
<b>setvar</b>	This command enables/disables short Guard Interval in 20 mhz mode. <b>Format:</b> ! U1 setvar "wlan.11n.short_gi_20mhz" "value" <b>Values:</b> "on" "off" <b>Default:</b> "off"
<b>getvar</b>	This command returns the current setting for short Guard Interval 20mhz operation. <b>Format:</b> ! U1 getvar "wlan.11n.short_gi_20mhz"

### Example:

```
U1 setvar "wlan.11n.short_gi_20mhz" "on"
```

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.8021x.validate\_peap\_server\_certificate

This command determines if the printer will validate the PEAP server certificate.

Commands	Details
<b>setvar</b>	Description <b>Format:</b> ! U1 setvar "wlan.8021x.validate_peap_server_certificate" "value" <b>Values:</b> "on" "off" <b>Default:</b> "on"
<b>getvar</b>	This command returns the current setting. <b>Format:</b> ! U1 getvar "wlan.8021x.validate_peap_server_certificate"

### Example:

```
! U1 setvar "wlan.8021x.validate_peap_server_certificate"
```

**Important** • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.active\_channels

This command returns list of current active channels defined by [wlan.allowed\\_band](#) on page 1191 and [wlan.user\\_channel\\_list](#) on page 1277.

**Supported Devices** ZT200 Series

**Type** getvar

Commands	Details
getvar	<p>This command returns the list of current active channels.</p> <p><b>Format:</b> ! U1 getvar "wlan.active_channels"</p> <p><b>Result:</b> One or more of the following channels: 1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,56,60,64,100,104,108, 112,116,132,136,140,149,153,157,161,165,all</p>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.adhoc\_last\_channel

Reports the last channel used for WiFi ad hoc communication.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "wlan.adhoc_last_channel" <b>Values:</b> a numeric value between 1-11 <b>Default:</b> "1"

### Supported Devices

- iMZ 220, iMZ320
- QLn220, QLn320, QLn420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.authenticated

Returns the authentication state of the wireless interface.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "wlan.authenticated" <b>Values:</b> "yes" = the printer wlan connection has been authenticated "no" = the printer wlan connection has not been authenticated

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.authentication\_error

Reports the last error that occurred during the WLAN authentication process.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "wlan.authentication_error" <b>Values:</b> "none" = the authentication was successful. "timed out" = the authentication did not succeed in the allotted time.

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.available

Determines if a WLAN radio has been installed in the printer.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "wlan.available" <b>Values:</b> "yes" = a WLAN radio is installed "no" = a WLAN radio is installed

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.allowed\_band

This command provides a method to restrict the 802.11n radio to either the 2.4 GHz or 5 GHz band.

Use this option when it is beneficial to have the radio use only one frequency band. Setting the 802.11n radio to one band will reduce roaming and radio association times since the radio will not scan as many channels.

Commands	Details
<b>setvar</b>	This command restricts the 802.11n radio to either the 2.4 GHz or 5 GHz band. <b>Format:</b> ! U1 setvar "wlan.allowed_band" "value" <b>Values:</b> "2.4, 5, all" <b>Default:</b> "all" <b>Note</b> • If both bands are desired, use "all"
<b>getvar</b>	This command returns the current setting for allowed bands. <b>Format:</b> ! U1 getvar "wlan.allowed_band"

**Example:** This example sets the allowed band to only the 2.4 GHz band.

```
U1 setvar "wlan.allowed_band" "2.4"
```

### Related Commands:

- [wlan.active\\_channels on page 1186](#)
- [wlan.user\\_channel\\_list on page 1277](#)

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.adhocautomode

This printer setting refers to enabling or disabling the adhoc auto mode.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the adhoc auto mode. <b>Format:</b> ! U1 setvar "wlan.adhocautomode" "value" <b>Values:</b> "on" = adhoc auto mode enabled "off" = adhoc auto mode disabled <b>Default:</b> "off"
<b>getvar</b>	This command instructs the printer to respond with the adhoc auto mode status. <b>Format:</b> ! U1 getvar "wlan.adhocautomode"

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "wlan.adhocautomode" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.adhocchannel

This printer setting refers to specifying the wireless channel for adhoc channel.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the wireless channel for adhoc channel mode. <b>Format:</b> ! U1 setvar "wlan.adhocchannel" "value" <b>Values:</b> Decimal value between 1 and 16 inclusive <b>Default:</b> "1"
<b>getvar</b>	This command instructs the printer to respond with the wireless channel for adhoc channel mode. <b>Format:</b> ! U1 getvar "wlan.adhocchannel"

**Example:** This **setvar** example shows the value set to "1".

```
! U1 setvar "wlan.adhocchannel" "1"
```

When the **setvar** value is set to "1", the **getvar** result is "1".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.associated

This command refers to if the printer is or is not associated with an access point (AP).

**getvar**

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with yes or no, which identifies if it is associated with the AP. <b>Format:</b> ! U1 getvar "wlan.associated"

**Example:** In this example, the **getvar** result is "yes".

```
! U1 getvar "wlan.associated"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.auth\_type

This parameter selects the authentication service to be used between the printer and the Access Point. Open System and Shared Key are the two types of authentication services.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the authentication type to the specified value. <b>Format:</b> ! U1 setvar "wlan.auth_type" "value" <b>Values:</b> "open" "shared" <b>Default:</b> "open"
<b>getvar</b>	This command instructs the printer to retrieve the current authentication type. <b>Format:</b> ! U1 getvar "wlan.auth_type"

→ **Example 1:** This example instructs the printer to set the authentication type to Shared Key.  
! U1 setvar "wlan.auth\_type" "shared"  
The authentication type will be set to Shared Key after power cycle.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.bssid

This command returns the MAC address of the access point (AP) with which the printer is associated.

### getvar

Commands	Details
getvar	This command retrieves the MAC address of the access point (AP). <b>Format:</b> ! U1 getvar "wlan.bssid"

**Example:** In this example, the **getvar** result is the MAC address of the access point.

! U1 getvar "wlan.bssid"

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.channel

This command retrieves the current WI-FI channel the printer is using.

### getvar

Commands	Details
getvar	This command retrieves the current WI-FI channel the printer is using. <b>Format:</b> ! U1 getvar "wlan.channel"

**Example:** In this example, the **getvar** retrieves the current WI-FI channel the printer is using.  
! U1 getvar "wlan.channel"

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.channel\_mask

This command specifies the wireless channel masks for enabling and disabling various channels. This controls which b/g radio channels can be used by the radio for network connections.

The value for this command is a bit field where a 0 disables a channel and a 1 enables the channel. Starting from the right, bit 0 is for channel 1, bit 1 for channel 2, etc. This can be used to limit the channels scanned for networks, which may slightly improve connection and roaming speed. It also used to ensure compliance with the regulatory domains of your location.

Commonly Used Channel Mask Settings		
Region	Channels	Channel Mask
United States, Canada, Latin America	1 - 11	0x7FF
Europe, Middle East, Africa, other	1 - 13	0x1FFF
Japan	1 - 14	0x3FFF

**Note** • This command is not supported by all radios. Ensure the channel masks are set in accordance with the regulatory domains of your country.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the wireless channel mask value.</p> <p><b>Format:</b> ! U1 setvar "wlan.channel_mask" "value"</p> <p><b>Values:</b> "0x0000" to "0xFFFF" (4 hexadecimal digits preceded by "0x")</p> <p><b>Default:</b> "0x7FF"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the wireless channel mask value.</p> <p><b>Format:</b> ! U1 getvar "wlan.channel_mask"</p>

**Example 1:** This **setvar** example shows the value set to "0x7FF" for common North American channels.

```
! U1 setvar "wlan.channel_mask" "0x7FF"
```

**Example 2:** This setvar example sets the channel mask to use only channels 1,6,11.

```
! U1 setvar "wlan.channel_mask" "0x421"
```

**Result:** Only channels 1, 6, and 11 will be used by the radio.

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.country\_code

This command defines the regulatory country for which the radio is currently configured.

Commands	Format and Details
setvar	<p>Sets the country code for which the radio is to be configured.</p> <p><b>Format:</b> ! U1 setvar "wlan.country_code" "value"</p> <p> <b>Important</b> • The list of country codes is specific to each printer and depends on the printer model and its wireless radio configuration. The list is subject to change, addition, or deletion with any firmware update, at any time, without notice.</p> <p>To determine the country codes available on your printer, issue the ! U1 getvar "wlan" command to return all commands related to WLAN settings. Locate the <b>wlan.country.code</b> command in the results and view the country codes available for your printer.</p>
getvar	<p>Retrieves the country code for which the radio is currently configured.</p> <p><b>! U1 getvar "wlan.country_code"</b></p>

**Example:** In this example, the **setvar** sets the country code to USA/Canada.

**! U1 setvar "wlan.country\_code" "usa/canada"**

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZT210, ZT220, ZT230, ZT420

### Note

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.current\_tx\_rate

This command retrieves the transmission rate of the wireless print server.

**getvar**

Commands	Details
<b>getvar</b>	This command instructs the printer to retrieve the current transmit rate of the wireless print server. <b>Format:</b> ! U1 getvar "wlan.current_tx_rate"

**Example:** In this example, the **getvar** retrieves the transmission rate of the wireless print server.

```
! U1 getvar "wlan.current_tx_rate"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.enable

This parameter can be used to enable or disable printer's Wireless LAN functionality.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "wlan.enable" "value" <b>Values:</b> "on" = Wireless LAN functionality is enabled "off" = Wireless LAN functionality is disabled <b>Default:</b> "off"
getvar	<b>Format:</b> ! U1 getvar "wlan.enable"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.encryption\_index

This parameter refers to the WEP (Wired Equivalent Privacy) encryption key index. It determines which one of the four encryption keys is to be used by the client (printer).

Commands	Details
<b>setvar</b>	This command instructs the printer to set the encryption key index the specified value. <b>Format:</b> ! U1 setvar "wlan.encryption_index" "value" <b>Values:</b> "1" "2" "3" "4" <b>Default:</b> "1"
<b>getvar</b>	This command instructs the printer to retrieve the current encryption key setting. <b>Format:</b> ! U1 getvar "wlan.encryption_index"

**Example:** In this example, the **setvar** command instructs the printer to set the encryption key index to 1.

```
! U1 setvar "encryption_index" "1"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.encryption\_key[1|2|3|4]1

These parameters refer to the first, second, third, and fourth indexed WEP encryption keys. The WEP encryption keys are hexadecimal strings that are either 10 or 26 characters long depending on the encryption method (40-bit or 128 bit). The keys should match the wireless network WEP encryption keys.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the encryption key value. <b>Format:</b> ! U1 setvar "wlan.encryption_key[1 2 3 4]" "value" <b>Values:</b> 10 hexadecimal characters for 40-bit encryption and 26 hexadecimal characters for 128-bit encryption. <b>Default:</b> All zeroes (10 or 26, depending on encryption setting)
<b>getvar</b>	This command instructs the printer respond with the encryption key value. <b>Format:</b> ! U1 getvar "wlan.encryption_key1"

→ **Example 1:** In these examples, the **getvar** results assume that the printer is using 40-bit encryption with the default settings.

```
! U1 getvar "wlan.encryption_key1"
! U1 getvar "wlan.encryption_key2"
! U1 getvar "wlan.encryption_key3"
! U1 getvar "wlan.encryption_key4"
```

**Results for each key:** "0000000000"

→ **Example 2:** In these examples, the **setvar** command instructs the printer to set the encryption key value. This example assumes that the printer is using 40-bit encryption.

```
! U1 setvar "wlan.encryption_key1" "A1B2C3D4F5"
! U1 setvar "wlan.encryption_key2" "G1H2J3K4L5"
! U1 setvar "wlan.encryption_key3" "M1N2P3Q4R5"
! U1 setvar "wlan.encryption_key4" "S1T2V3W4X5"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.encryption\_mode

This parameter refers to WEP (Wired Equivalent Privacy) encryption. This parameter enables and disables the printer's WEP encryption. When using WEP encryption make sure that the encryption key matches the wireless network WEP encryption key.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn the LEAP mode "on" or "off". <b>Format:</b> ! U1 setvar "wlan.encryption_mode" "value" <b>Values:</b> "off" "40-bit" "128-bit" <b>Default:</b> "off"
<b>getvar</b>	This command returns the type of encryption that is currently being used by the printer. <b>Format:</b> ! U1 getvar "wlan.encryption_mode"

→ **Example 1:** This example instructs the printer to set encryption to 40-bit.

```
! U1 setvar "wlan.encryption_mode" "40-bit"
```

→ **Example 2:** This example instructs the printer to turn encryption off.

```
! U1 setvar "wlan.encryption_mode" "off"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.essid

This printer setting refers to the printer's stored ESSID. Setting the ESSID to "" will set the printer in a "**broadcast**" mode.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the ESSID. <b>Format:</b> ! U1 setvar "wlan.essid" "value" <b>Values:</b> 32 character alphanumeric string <b>Default:</b> "125"
<b>getvar</b>	This command instructs the printer to respond with the stored ESSID value. <b>Format:</b> ! U1 getvar "wlan.essid"

**Example:** This **setvar** example shows the value set to "125".

```
! U1 setvar "wlan.essid" "125"
```

When the **setvar** value is set to "125", the **getvar** result is "125".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.firmware\_version

This command refers to the firmware version of the wireless radio card.

**getvar**

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the current version of the wireless radio card firmware. <b>Format:</b> ! U1 getvar "wlan.firmware_version"

**Example:** In this example, the **getvar** result is the version of Symbol 4137 card (for example, "F3.91-69").

```
! U1 getvar "wlan.firmware_version"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.addr

This command allows you to get or set the wireless print servers's IP address.

**Important** • For a set IP address to take affect, the IP protocol must be set to permanent and the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change its current wireless print server IP address upon powering the printer on.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.addr" "value"</p> <p><b>Values:</b> any valid IP address</p> <p><b>Default:</b> "0.0.0.0"</p> <p> <b>Note</b> • The <b>setvar</b> value of this command can be affected by the <b>wlan.ip.dhcp.enable</b> command.</p>
<b>getvar</b>	<p>This command instructs the printer to respond with its current wireless print server IP address.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.addr"</p>

**Example:** This **setvar** example shows the value set to "10.14.4.235".

```
! U1 setvar "wlan.ip.addr" "10.14.4.235"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "10.14.4.235".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.arp\_interval

This print server setting allows you to specify the ARP (Address Resolution Protocol) interval or the ARP cache time out for the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to respond with the ARP interval or the ARP cache time out value for the wireless print server. <b>Format:</b> ! U1 setvar "wlan.ip.arp_interval" "value" <b>Values:</b> 0 to 30 seconds <b>Default:</b> "0"
<b>getvar</b>	This command instructs the printer to respond with the ARP interval or the ARP cache time out value (in seconds) for the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.arp_interval"

**Example:** This **setvar** example shows the value set to "0".

```
! U1 setvar "wlan.ip.arp_interval" "0"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "0".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.default\_addr\_enable

This command allows you to default the wireless print server's IP address.

**Important** • For a set IP address to take affect, the IP protocol must be set to permanent and the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command tells the printer to use it's default address, if no address is provided through DHCP or BOOTP. If you do not assign an IP address after 2 minutes, the 10/100 Internal PS defaults to IP address 192.168.254.254.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.default_addr_enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"on" = enabled</li> <li>"off" = disabled</li> </ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to show the status of the setting of the wireless print server's default IP address feature.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.default_addr_enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "wlan.ip.default_addr_enable" "on"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "on".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.arp\_verify

Specifies whether an ARP broadcast will be sent out to verify that the IP address received from the DHCP server is not already in use.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "wlan.ip.dhcp.arp_verify" "value" <b>Values:</b> "on" = an ARP broadcast will be sent out "off" = an ARP broadcast will not be sent out <b>Default:</b> "on" = for Desktop and Industrial printers "off" = for Mobile printers
getvar	<b>Format:</b> ! U1 getvar "wlan.ip.dhcp.arp_verify"

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.cache\_ip

This command enables or disables the IP cache of the wireless print server.

Commands	Details
<b>setvar</b>	This command sets the status of the IP cache. <b>Format:</b> ! U1 setvar "ip.dhcp.cache_ip" "value" <b>Values:</b> "on" = enabled "off" = disabled <b>Default:</b> "off"
<b>getvar</b>	This command retrieves the status of the IP cache. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.cache_ip"

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "wlan.ip.dhcp.cache_ip" "off"
```

When the **setvar** value is set to "off", the **getvar** result is "off".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.cid\_all

This printer setting defines the entire client identifier (DHCP option 61) if DHCP is enabled on the wireless print server and "wlan.ip.dhcp.cid\_type" is set to "0", or "2". The MAC address is used if the type is set to "1".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the client identifier prefix and suffix of the wireless print server. The prefix gets cleared and the suffix contains the entire client identifier.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.dhcp.cid_all" "value"</p> <p><b>Values:</b> A maximum length of 60 characters if the CID type is ASCII, or 120 characters if the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier prefix and suffix of the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.dhcp.cid_all"</p>

**Example:** This **setvar** example shows the value set to "printer".

```
! U1 setvar "wlan.ip.dhcp.cid_all" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.cid\_enable

This command determines if DHCP (option 61) is turned on or off of the wireless print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the status of the client identifier of the wireless print server.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.dhcp.cid_enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"off" = client identifier is turned off</li><li>"on" = client identifier is turned on</li></ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the status of the client identifier of the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.dhcp.cid_enable"</p>

**Example:** This **setvar** example shows the value set to "off".

```
! U1 setvar "wlan.ip.dhcp.cid_enable" "off"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "off".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.cid\_prefix

This printer setting defines the prefix to be prepended to the DHCP client identifier (option 61) when DHCP is enabled on the wireless print server and "wlan.ip.dhcp.cid\_type" is set to "0" or "2".

Commands	Details
<b>setvar</b>	This command instructs the printer to change the CID prefix of the wireless print server. <b>Format:</b> ! U1 setvar "wlan.ip.dhcp.cid_prefix" "value" <b>Values:</b> Any text string up to 10 characters if the CID type is ASCII, or 20 characters if the CID type is hexadecimal. <b>Default:</b> ""
<b>getvar</b>	This command instructs the printer to respond with the client identifier prefix of the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.cid_prefix"

**Example:** This **setvar** example shows the value set to "PRT001".

```
! U1 setvar "wlan.ip.dhcp.cid_prefix" "PRT001"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "PRT001".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.cid\_suffix

This printer setting defines the unique suffix to be used as the client identifier (DHCP option 61) if DHCP is enabled on the wireless print server and "wlan.ip.dhcp.cid\_type" is set to "0" or "2".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to change the client identifier suffix value on the wireless print server.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.dhcp.cid_suffix" "value"</p> <p><b>Values:</b> The maximum length of a value allowed is 60 ASCII characters when the CID type is ASCII, or 120 hexadecimal values when the CID type is hexadecimal.</p> <p><b>Default:</b> ""</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier suffix on the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.dhcp.cid_suffix"</p>

**Example:** This **setvar** example shows the value set to "printer".

```
! U1 setvar "wlan.ip.dhcp.cid_suffix" "printer"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "printer".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.cid\_type

This printer setting defines the type of client identifier (DHCP option 61) that will be sent if DHCP is enabled on the wireless print server. A value of "1" means the type of "Ethernet" and the printer's MAC address will be used. A value of "0" or "2" means the client identifier sent will be "wlan.ip.dhcp.cid\_prefix" concatenated with "wlan.ip.dhcp.cid\_suffix".

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to enable "synthetic" client identifier for the wireless print server.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.dhcp.cid_type" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"0" = ASCII string</li> <li>"1" = wireless radio card's MAC address</li> <li>"2" = HEX value</li> </ul> <p><b>Default:</b> "1"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the client identifier type for the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.dhcp.cid_type"</p>

**Example:** This **setvar** example shows the value set to "1".

```
! U1 setvar "wlan.ip.dhcp.cid_type" "1"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "1".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.lease.last\_attempt

This command retrieves the last time a DHCP request was sent from the wireless print server.

### getvar

Commands	Details
<b>getvar</b>	This command retrieves the last time a DHCP request was sent from the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.lease.last_attempt"

**Example:** In this example, the **getvar** retrieves the last time a DHCP request was sent from the wireless print server.

```
! U1 getvar "wlan.ip.dhcp.lease.last_attempt"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.lease.length

This command retrieves the original length (in seconds) of the DHCP lease on the wireless print server.

**getvar**

Commands	Details
<b>getvar</b>	This command retrieves the original length (in seconds) of the DHCP lease on the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.lease.length"

**Example:** This command retrieves the original length of the DHCP lease on the wireless print server.

```
! U1 getvar "wlan.ip.dhcp.lease.length"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.lease.server

This command retrieves the address of the print server that provided the DHCP lease on the wireless print server.

### getvar

Commands	Details
<b>getvar</b>	This command retrieves the address if the print server that provided the DHCP lease on the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.lease.server"

**Example:** In this example, the **getvar** retrieves the server that provided the DHCP lease on the wireless print server.

```
! U1 getvar "wlan.ip.dhcp.lease.server"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.lease.time\_left

This command retrieves the time (in seconds) left in the current DHCP lease on the wireless print server.

### getvar

Commands	Details
<b>getvar</b>	This command retrieves the time (in seconds) left in the current DHCP lease on the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.lease.time_left"

→ **Example:** In this example, the **getvar** retrieves the time left in the current DHCP lease on the wireless print server.

```
! U1 getvar "wlan.ip.dhcp.lease.time_left"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.option12

This command specifies if the DHCP option 12 (host name) is on or off in the discovery packet that is sent from the wireless print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the DHCP option 12 (host name) is on or off in the discovery packet that is sent from the wireless print server.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.dhcp.option12" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"on" = turns on option 12</li><li>"off" = turns off option 12</li></ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command retrieves the status of the DHCP option 12 (host name) is on or off in the discovery packet that is sent from the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.dhcp.option12"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "wlan.ip.dhcp.option12" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.option12\_format

This command specifies the format of the option 12 value to be used in the discovery packet of the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the format of option 12 value to be used in the discovery packet of the wireless print server. <b>Format:</b> ! U1 setvar "wlan.ip.dhcp.option12_format" "value" <b>Values:</b> string <b>Default:</b> ""
<b>getvar</b>	This command retrieves the format of option 12 value to be used in the discovery packet of the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.option12_format"

**Example:** This **setvar** example shows configuring the wlan.ip.dhcp.option12\_format to the value contained in the device.friendly\_name.

It is necessary to surround the SGD entry to be used as source for the data with the < and > characters.

```
! U1 setvar "wlan.ip.dhcp.option12_format" "<device.friendly_name>"
```

To further explain, if the above command was issued and the value currently stored in the device.friendly\_name parameter was "ShipPrinter", then the response to following command would be "ShipPrinter":

```
! U1 getvar "wlan.ip.dhcp.option12_value"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.option12\_value

This command retrieves the actual value which will be used in the discovery packet of the wireless print server.

### getvar

Commands	Details
getvar	<p>This command retrieves the actual value which will be used in the discovery packet of the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.dhcp.option12_value"</p>

→ **Example:** This **setvar** example shows configuring the wlan.ip.dhcp.option12\_format to the value contained in the device.friendly\_name.

It is necessary to surround the SGD entry to be used as source for the data with the < and > characters.

**! U1 setvar "wlan.ip.dhcp.option12\_format" "<device.friendly\_name>"**

To further explain, if the above command was issued and the value currently stored in the device.friendly\_name parameter was "ShipPrinter", then the response to following command would be "ShipPrinter":

**! U1 getvar "wlan.ip.dhcp.option12\_value"**

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.request\_timeout

This command sets the maximum time (in seconds) to wait for a response to a DHCP discovery request on the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the maximum time (in seconds) to wait for a response to a DHCP discovery request on the wireless print server. <b>Format:</b> ! U1 setvar "wlan.ip.dhcp.request_timeout" "value" <b>Values:</b> "2" through "30" <b>Default:</b> "2"
<b>getvar</b>	This command retrieves the maximum time (in seconds) to wait for a response to a DHCP discovery request on the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.request_timeout"

**Example:** This **setvar** example shows the value set to "2".

```
! U1 setvar "wlan.ip.dhcp.request_timeout" "2"
```

When the **setvar** value is set to "2", the **getvar** result is "2".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.requests\_per\_session

This command retrieves the maximum amount of DHCP discover requests for a single DHCP session on the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the maximum amount of DHCP discover requests for a single DHCP session on the wireless print server. <b>Format:</b> ! U1 setvar "wlan.ip.dhcp.requests_per_session" "value" <b>Values:</b> "1" through "10" <b>Default:</b> "2"
<b>getvar</b>	This command retrieves the currently set maximum amount of DHCP discover requests for a single DHCP session on the wireless print server. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.requests_per_session"

**Example:** This **setvar** example shows the value set to "2".

```
! U1 setvar "wlan.ip.dhcp.requests_per_session" "2"
```

When the **setvar** value is set to "2", the **getvar** result is "2".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dhcp.session\_interval

This command retrieves how long it will take for a DHCP session to time out before a new DHCP session begins on the wireless print server.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the DHCP session time out. <b>Format:</b> ! U1 setvar "wlan.ip.dhcp.session_interval" "value" <b>Values:</b> "0" through "60" <b>Default:</b> "10"
<b>getvar</b>	This command retrieves the current DHCP session time out. <b>Format:</b> ! U1 getvar "wlan.ip.dhcp.session_interval"

**Example:** This **setvar** example shows the value set to "10".

```
! U1 setvar "wlan.ip.dhcp.session_interval" "10"
```

When the **setvar** value is set to "10", the **getvar** result is "10".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.dns.servers

This command retrieves a space delimited list of the domain name servers from a wlan print server.

### getvar

Commands	Details
getvar	This command retrieves a list of space delimited DNS wlan print servers. <b>Format:</b> ! U1 getvar "wlan.ip.dns.servers"

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.gateway

This command instructs the printer to change the wireless print server's gateway address.

**Note** • This setting refers to the gateway address. A set value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the wireless printer server's gateway address. <b>Format:</b> ! U1 setvar "wlan.ip.gateway" "value" <b>Values:</b> Any valid gateway address <b>Default:</b> "0.0.0.0"
<b>getvar</b>	This command instructs the printer to respond with the wireless printer server's gateway address. <b>Format:</b> ! U1 getvar "wlan.ip.gateway"

**Example:** This **setvar** example shows the value set to "10.3.5.1".

```
! U1 setvar "wlan.ip.gateway" "10.3.5.1"
```

When the **setvar** value is set to "10.3.5.1", the **getvar** result is "10.3.5.1".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.netmask

This setting refers to the wireless print server's subnet mask address. This value is ignored if the IP protocol is not set to permanent.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the wireless print servers's subnet mask. <b>Format:</b> ! U1 setvar "wlan.ip.netmask" "value" <b>Values:</b> Any valid subnet mask. <b>Default:</b> "255.255.255.0"
<b>getvar</b>	This command instructs the printer to respond with wireless print server's subnet mask. <b>Format:</b> ! U1 getvar "wlan.ip.netmask"

→ **Example:** This **setvar** example shows the value set to "255.255.255.0".

```
! U1 setvar "wlan.ip.netmask" "255.255.255.0"
```

When the **setvar** value is set to "255.255.255.0", the **getvar** result is "255.255.255.0".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.port

This printer setting refers to the wireless print server's port number that the TCP print service is listening on. Normal TCP communications from the host should be directed to this port.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the wireless print server's TCP/UDP port number. <b>Format:</b> ! U1 setvar "wlan.ip.port" "value" <b>Values:</b> 1 - 65535 (excluding any ports currently used by other services, such as 21, 23, 80, and 515). <b>Default:</b> "9100"
<b>getvar</b>	This command instructs the printer to respond with the wireless printer server's TCP/UDP port number. <b>Format:</b> ! U1 getvar "wlan.ip.port"

**Example:** This **setvar** example shows the value set to "**9100**".

```
! U1 setvar "wlan.ip.port" "9100"
```

When the **setvar** value is set to "**9100**", the **getvar** result is "**9100**".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.port\_alternate

This command sets the port number of the alternate wlan port.

**Note** • Print servers supporting this command will monitor both the primary port and the alternate port for connections at the same time.

Commands	Details
setvar	<p>This command sets the alternate wlan port for the print server.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.port_alternate" "value"</p> <p><b>Values:</b> Any valid TCP port address.</p> <p><b>Default:</b> 9100</p>
getvar	<p>This command returns the current alternate wlan port setting.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.port_alternate"</p> <p><b>Values:</b> The current port setting.</p>

**Example 1:** This **setvar** example shows the value set to "**6101**".

```
U1 setvar "wlan.ip.port_alternate" "6101"
```

**Example 2:** This setvar example sets the channel mask to use only channels 1,6,11.

```
! U1 setvar "wlan.channel_mask" "0x421"
```

**Result:** Only channels 1, 6, and 11 will be used by the radio.

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

**Supported Devices** ZT200 Series

## wlan.ip.port\_json\_config

This command determines the TCP port number to listen on for JSON configuration packets.

### Supported Devices

- iMZ 220™, iMZ 320™
- QLn220™, QLn320™, QLn420™
- ZT210™, ZT220™, ZT230™

Type `setvar; getvar`

Commands	Details
<b>setvar</b>	<p>This command determines the TCP port number on which to listen for JSON configuration packets.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.port_json_config" "value"</p> <p><b>Values:</b> Any valid port number except ports already in use or the standard network ports.</p> <ul style="list-style-type: none"> <li>• <b>0</b> = disable the port</li> <li>• <b>1-65535</b> = port number to listen on.</li> </ul> <p><b>Default:</b> "9200"</p>
<b>getvar</b>	<p>This command retrieves the TCP port number which is listening for JSON configuration packets.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.port_json_config"</p>

**Example:** In this example, the `getvar` command causes the printer to get the TCP port number which is listening for JSON configuration packets.

```
! U1 getvar "wlan.ip.port_json_config"
```

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.protocol

This command configures the IP addressing method used by the wireless print server.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to configure the IP addressing method used by the wireless print server.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.protocol" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"<b>bootp</b>" = uses the standard bootp addressing method to obtain an IP address and configuration</li> <li>"<b>dhcp</b>" = uses the standard dhcp addressing method to obtain an IP address and configuration for a server specified period of time</li> <li>"<b>rarp</b>" = uses the standard rarp addressing method to obtain an IP address</li> <li>"<b>glean only</b>" = uses the IP address from a PING packet that is sent to its hardware address (unicast address)</li> <li>"<b>permanent</b>" = uses static values assigned through other commands</li> <li>"<b>all</b>" = tries all of the dynamic addressing methods, not permanent, to obtain an IP address</li> </ul> <p><b>Default:</b> "all"</p>
<b>getvar</b>	<p>This command returns the value of the currently selected IP protocol used by the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.protocol"</p>

**Example:** In this example, the **setvar** result is the current programming language that the printer is using.

```
! U1 setvar "wlan.ip.protocol" "bootp"
```

What the **setvar** value is set to is the **getvar** result. In this example, the **getvar** result is "**bootp**".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.timeout.enable

This network setting refers to enabling the connection timeout on the wireless print server. For this to take effect, the print server must be reset.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to enable or disable the timeout checking on the wireless print server.</p> <p><b>Format:</b> ! U1 setvar "wlan.ip.timeout.enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"off" = turns off the connection checking</li><li>"on" = turns on the connection checking</li></ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to return whether the timeout checking is enabled on the wireless print server.</p> <p><b>Format:</b> ! U1 getvar "wlan.ip.timeout.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "wlan.ip.timeout.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.timeout.value

This network setting refers to the number of seconds before the connection times out for the wireless print server. For this to take effect, the print server must be reset.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the time value of the wireless print server, in seconds, before the connection times out. <b>Format:</b> ! U1 setvar "wlan.ip.timeout.value" "value" <b>Values:</b> "1" through "3600" <b>Default:</b> "300"
<b>getvar</b>	This command instructs the printer to respond with the time, in seconds, before the connection times out. <b>Format:</b> ! U1 getvar "wlan.ip.timeout.value"

**Example:** This **setvar** example shows the value set to "300".

```
! U1 setvar "wlan.ip.timeout.value" "300"
```

When the **setvar** value is set to "300", the **getvar** result is "300".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.wins.addr

Specifies the WINS server address. If WINS Addressing is done via DHCP, then this value will automatically be filled by the DHCP server.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "wlan.ip.wins.addr" "value" <b>Values:</b> a valid IP address <b>Default:</b> "0.0.0.0"
getvar	<b>Format:</b> ! U1 getvar "wlan.ip.wins.addr"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.ip.wins.permanent\_source

Specifies if the source of the WINS address is DHCP or if it is set manually.

Commands	Details
setvar	<b>Format:</b> ! U1 setvar "wlan.ip.wins.permanent_source" "value" <b>Values:</b> "off": Use DHCP assigned WINS address "on": Use manually set WINS address (set via <code>wlan.ip.wins.addr</code> ) <b>Default:</b> "off"
getvar	<b>Format:</b> ! U1 getvar "wlan.ip.wins.permanent_source"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.keep\_alive.enable

This setting controls the printers ability to send a LSAP (link service access point) packet to the access point on an user controllable interval. This feature is included to accommodate access points that require a regular confirmation that wireless clients are still active.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to send a LSAP (link service access point) packet to the access point on an user controllable interval.</p> <p><b>Format:</b> ! U1 setvar "wlan.keep_alive.enable" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"on" = turns on keep_alive</li><li>"off" = turns off keep_alive</li></ul> <p><b>Default:</b> "on"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the <b>wlan.keep_alive.enable</b> setting.</p> <p><b>Format:</b> ! U1 getvar "wlan.keep_alive.enable"</p>

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "wlan.keep_alive.enable" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.keep\_alive.timeout

This printer setting manages the interval at which the LSAP (link service access point) packet is sent.

Commands	Details
<b>setvar</b>	This command instructs the printer to configure the frequency at which the printer sends the <b>wlan.keep_alive</b> packet. <b>Format:</b> ! U1 setvar "wlan.keep_alive.timeout" "value" <b>Values:</b> 5 to 300 seconds <b>Default:</b> "15"
<b>getvar</b>	This command instructs the printer to respond with the <b>wlan.keep_alive.timeout</b> interval value. <b>Format:</b> ! U1 getvar "wlan.keep_alive.timeout"

**Example:** This **setvar** example shows the value set to "15".

```
! U1 setvar "wlan.keep_alive.timeout" "15"
```

When the **setvar** value is set to "15", the **getvar** result is "15".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.kerberos.kdc

This printer setting refers to the Kerberos Key Distribution Center (KDC). The KDC is a trusted server which maintains a database with account information for all security principals (users) for a particular site or administrative domain (realm).

Commands	Details
<b>setvar</b>	This command instructs the printer to change the Kerberos KDC. <b>Format:</b> ! U1 setvar "wlan.kerberos.kdc" "value" <b>Values:</b> 0-32 ASCII characters <b>Default:</b> "krbtgt"
<b>getvar</b>	This command instructs the printer to respond with the current Kerberos KDC. <b>Format:</b> ! U1 getvar "wlan.kerberos.kdc"

**Example:** This **setvar** example shows the value set to "krbtgt".

```
! U1 setvar "wlan.kerberos.kdc" "krbtgt"
```

When the **setvar** value is set to "krbtgt", the **getvar** result is "krbtgt".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.kerberos.mode

This printer setting refers to the Kerberos network authentication protocol. Kerberos provides secure mutual authentication for a wireless client through a Symbol Access Point, based on user information stored on a Kerberos KDC (Key Distribution Center) server.

Commands	Details
<b>setvar</b>	This command instructs the printer to turn Kerberos mode "on" or "off". <b>Format:</b> ! U1 setvar "wlan.kerberos.mode" "values" <b>Values:</b> "off" = disables Kerberos mode "on" = enables Kerberos mode <b>Default:</b> "off"
<b>getvar</b>	This command instructs the printer to respond with the current Kerberos mode. <b>Format:</b> ! U1 getvar "wlan.kerberos.mode"

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "wlan.kerberos.mode" "on"
```

When the **setvar** value is set to "on", the **getvar** result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.kerberos.password

This printer setting refers to the Kerberos password. The password must correspond to a user profile established on the Kerberos KDC server in use.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the Kerberos password. <b>Format:</b> ! U1 <b>setvar</b> "wlan.kerberos.password" "value" <b>Values:</b> 0-32 alphanumeric characters <b>Default:</b> "password"
<b>getvar</b>	This command instructs the printer to respond with the current Kerberos password. <b>Format:</b> ! U1 <b>getvar</b> "wlan.kerberos.password" For protection a single "*" prints.

**Example:** This **setvar** example shows the value set to "password".

```
! U1 setvar "wlan.kerberos.password" "password"
```

When the **setvar** value is set to "password", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.kerberos.realm

This printer setting refers to the Kerberos realm, an administrative domain with its own Kerberos server (KDC).

**Important** • If you are using a Windows 2000 Server the realm must be all upper-case. For details, see [Example 2](#) below.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the Kerberos realm. <b>Format:</b> ! U1 setvar "wlan.kerberos.realm" "value" <b>Values:</b> 0-64 alphanumeric characters <b>Default:</b> "kerberos"
<b>getvar</b>	This command instructs the printer to respond with the current Kerberos realm. <b>Format:</b> ! U1 getvar "wlan.kerberos.realm"

**Example 1:** This **setvar** example shows the value set to "zebra".

```
! U1 setvar "wlan.kerberos.realm" "zebra"
```

When the **setvar** value is set to "zebra", the **getvar** result is "zebra".

**Example 2:** This **setvar** example shows the value set to "ZEBRA" on a Windows 2000 server.

```
! U1 setvar "wlan.kerberos.realm" "ZEBRA"
```

When the **setvar** value is set to "ZEBRA", the **getvar** result is "ZEBRA".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.kerberos.username

This printer setting refers to the Kerberos user name. The user name must correspond to a user profile established on the Kerberos KDC server in use.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the Kerberos user name. <b>Format:</b> ! U1 setvar "wlan.kerberos.username" "value" <b>Values:</b> 0-32 alphanumeric characters <b>Default:</b> "user"
<b>getvar</b>	This command instructs the printer to respond with the current Kerberos user name. <b>Format:</b> ! U1 getvar "wlan.kerberos.username"

**Example:** This **setvar** example shows the value set to "user".

```
! U1 setvar "wlan.kerberos.username" "user"
```

When the **setvar** value is set to "user", the **getvar** result is "user".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.leap\_mode

This printer setting refers to Cisco LEAP (Lightweight Extensible Authentication Protocol). LEAP provides secure mutual authentication for a wireless client through a Cisco Aironet Access Point, based on user information stored on a backend RADIUS (Remote Authentication in Dial-Up User Service) /AAA (Authentication, Authorization, and Accounting) server.

**Note •**

1. This command is only supported on printers using firmware Vxx.18.xx or earlier.
2. This command is not supported on units with a Frequency Hopping Spread Spectrum (FHSS) radio.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to turn the LEAP mode "on" or "off".</p> <p><b>Format:</b> ! U1 setvar "wlan.leap_mode" "values"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"off" = disables LEAP mode</li> <li>"on" = enables LEAP mode</li> </ul> <p><b>Default:</b> "off"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the LEAP mode.</p> <p><b>Format:</b> ! U1 getvar "wlan.leap_mode"</p>

**Example:** This setvar example shows the value set to "on".

```
! U1 setvar "wlan.leap_mode" "on"
```

When the setvar value is set to "on", the getvar result is "on".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.leap\_password

This printer setting refers to the LEAP password. The password must correspond to a user profile established on the RADIUS/AAA server in use.

**Note •** This parameter is not supported on units with a Frequency Hopping Spread Spectrum (FHSS) radio.

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.leap\_username

This printer setting refers to the LEAP user name. The user name must correspond to a user profile established on the RADIUS/AAA server in use.

**Note •** This parameter is not supported on units with a Frequency Hopping Spread Spectrum (FHSS) radio.

Commands	Details
<b>setvar</b>	This command instructs the printer to change the LEAP user name. <b>Format:</b> ! U1 setvar "wlan.leap_username" "values" <b>Values:</b> 0-32 alphanumeric ASCII characters. <b>Default:</b> "user"
<b>getvar</b>	This command instructs the printer to respond with the LEAP user name. <b>Format:</b> ! U1 getvar "wlan.leap_username"

**Example:** This setvar example shows the value set to "user".

```
! U1 setvar "wlan.leap_username" "user"
```

When the setvar value is set to "user", the getvar result is "user".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.mac\_addr

This command retrieves the MAC address of the wireless print server.

**getvar**

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the MAC address of the wireless print server. <b>Format:</b> ! U1 getvar "wlan.mac_addr"

**Example:** In this example, the **getvar** result is the MAC address for the wireless print server.

! U1 getvar "wlan.mac\_addr"

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.mac\_raw

This command specifies the RAW MAC address of the wireless print server. The raw mac address is the mac address without the colons (":").

### getvar

Commands	Details
getvar	This command retrieves the RAW MAC address of the wireless print server. <b>Format:</b> ! U1 getvar "wlan.mac_raw"

**Example:** In this example, the **getvar** retrieves the RAW MAC address of the wireless print server.

```
! U1 getvar "wlan.mac_raw"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.operating\_mode

This printer setting refers to the network operating mode. Infrastructure mode means that the printer will try to associate with an access point. Ad hoc mode means that the printer will try to associate with a device other than an access point and join a standalone network.

To use "ad hoc" mode configure the printer as follows:

- Set the ESSID to the new network's ESSID.
- Turn off the DHCP and assign an IP Address to the printer.
- Set the subnet mask on the printer to the new network's subnet mask.
- Change the operating mode on the printer to "ad hoc".

Commands	Details
<b>setvar</b>	This command instructs the printer to set the network operating mode. <b>Format:</b> ! U1 setvar "wlan.operating_mode" "value" <b>Values:</b> "adhoc" = printer will try to associate with a network device "infrastructure" = printer will try to associate with an access point <b>Format:</b> "infrastructure"
<b>getvar</b>	This command instructs the printer to respond with the network-mode value. <b>Format:</b> ! U1 getvar "wlan.operating_mode"

**Example:** This setvar example shows the value set to "infrastructure".

```
! U1 setvar "wlan.operating_mode" "infrastructure"
```

When the setvar value is set to "infrastructure", the getvar result is "infrastructure".

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.password

This printer setting refers to the generic password that is used by the wireless securities that need a password.

**Important** • Kerberos has its own password field

Commands	Details
<b>setvar</b>	This command instructs the printer to set a generic password for the wireless securities that need a password. <b>Format:</b> ! U1 setvar "wlan.password" "value" <b>Values:</b> A maximum of 32 alphanumeric characters. <b>Default:</b> "password"
<b>getvar</b>	This command instructs the printer to respond with a generic password for wireless securities. <b>Format:</b> ! U1 getvar "wlan.password" For protection a single "*" prints.

**Example:** This setvar example shows the value set to "password".

```
! U1 setvar "wlan.password" "password"
```

When the setvar value is set to "password", the getvar result is "\*".

**Note** •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.permitted\_channels

This command returns the list of permitted channels.

Related Commands:

- [wlan.active\\_channels](#) on page 1186
- [wlan.allowed\\_band](#) on page 1191

**Supported Devices** ZT200 Series

Type `getvar`

Commands	Details
<code>getvar</code>	<p>This command returns the list of permitted channels within the defined country or region.</p> <p><b>Format:</b> ! U1 <code>getvar "wlan.permitted_channels"</code></p> <p><b>Result:</b> One or more of the following channels: <code>1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,56,60,64,100,104,108,112,116,132,136,140</code></p>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.poor\_signal\_threshold

Sets or returns the poor signal threshold value. The poor signal threshold is a percentage of the signal strength.

Commands	Details
setvar	Format: ! U1 setvar "wlan.poor_signal_threshold" "value" Values: 0-100 Default: "0"
getvar	Format: ! U1 getvar "wlan.poor_signal_threshold"

### Supported Devices

- ZT210, ZT220, ZT230
- ZT410, ZT420

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.preamble

This printer setting selects the radio preamble length to be used.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the preamble length. <b>Format:</b> ! U1 setvar "wlan.preamble" "value" <b>Values:</b> "long" = enables long preamble "short" = enables short preamble <b>Default:</b> "long"
<b>getvar</b>	This command instructs the printer to respond with the current preamble length. <b>Format:</b> ! U1 getvar "wlan.preamble"

**Example:** This **setvar** example shows the value set to "long".

```
! U1 setvar "wlan.preamble" "long"
```

When the **setvar** value is set to "long", the **getvar** result is "long".

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.private\_key\_password

This printer setting allows the setting of the optional private key password.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the private key password. <b>Format:</b> ! U1 setvar "wlan.private_key_password" "value" <b>Values:</b> A maximum of 32 alphanumeric characters <b>Default:</b> ""
<b>getvar</b>	This command instructs the printer to respond with the value of the private key password. <b>Format:</b> ! U1 getvar "wlan.private_key_password" For protection a single "*" prints.

**Example:** This **setvar** example shows the value set to "password".

```
! U1 setvar "wlan.private_key_password" "password"
```

When the **setvar** value is set to "password", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.region\_code

This command defines the regulatory country for which the radio is currently configured.

Commands	Details
<b>setvar</b>	This command sets the region code for which the radio is to be configured. <b>! U1 setvar "wlan.region_code" "value"</b> <b>Values:</b> <ul style="list-style-type: none"><li>• <b>not available</b></li><li>• <b>usa/canada</b></li><li>• <b>japan</b></li><li>• <b>rest of world</b></li></ul>
<b>getvar</b>	This command retrieves the region code for which the radio is currently configured. <b>! U1 getvar "wlan.country_code"</b>

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.roam.interchannel\_delay

This command sets how long of a delay before scanning the next channel when roaming.

Commands	Details
<b>setvar</b>	This command sets how long of a delay before scanning the next channel when roaming. The values are in milliseconds. <b>Format:</b> ! U1 setvar "wlan.roam.interchannel_delay" "value" <b>Values:</b> 0 to 30000 <b>Default:</b> "400"
<b>getvar</b>	This command retrieves the current set delay time before scanning the next channel when roaming. <b>Format:</b> ! U1 getvar "wlan.roam.interchannel_delay"

**Example:** This **setvar** example shows the value set to "400".

```
! U1 setvar "wlan.roam.interchannel_delay" "400"
```

The **getvar** result returns the current **setvar** value. In this example, the **getvar** result is "400".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.roam.interval

This printer setting refers to specifying the wireless roam interval.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the wireless roam interval. <b>Format:</b> ! U1 setvar "wlan.roam.interval" "value" <b>Values:</b> Decimal values between 5 and 255 inclusive <b>Default:</b> "20"
<b>getvar</b>	This command instructs the printer to respond with the specified roam interval. <b>Format:</b> ! U1 getvar "wlan.roam.interval"

**Example:** This **setvar** example shows the value set to "20".

```
! U1 setvar "wlan.roam.interval" "20"
```

When the **setvar** value is set to "20", the **getvar** result is "20".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.roam.max\_chan\_scan\_time

This command sets how long the radio waits on a channel looking for probe responses.

Commands	Details
<b>setvar</b>	This command sets how long the radio waits on a channel looking for probe responses. The values are in milliseconds. <b>Format:</b> ! U1 setvar "wlan.roam.max_chan_scan_time" "value" <b>Values:</b> 10 to 500 <b>Default:</b> "100"
<b>getvar</b>	This command retrieves the current setting for how long the radio waits on a channel looking for probe responses. <b>Format:</b> ! U1 getvar "wlan.roam.max_chan_scan_time"

**Example:** This **setvar** example shows the value set to "100".

```
! U1 setvar "wlan.roam.max_chan_scan_time" "100"
```

The **getvar** result returns the current **setvar** value. In this example, the **getvar** result is "100".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.roam.max\_fail

This command determines the number of consecutive tx packet failures, at which point the radio should start its roaming algorithm.

Commands	Details
<b>setvar</b>	This command sets the max_fail threshold value. <b>Format:</b> ! U1 setvar "wlan.roam.max_fail" "value" <b>Values:</b> 2 to 75 inclusive <b>Default:</b> 10
<b>getvar</b>	This command returns the number for the max_fail threshold. <b>Format:</b> ! U1 getvar "wlan.roam.max_fail"

→ **Example:** In this example, the **setvar** sets the max\_fail threshold value to 30 packets.

```
! U1 setvar "wlan.roam.max_fail" "30"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.roam.rssi

This command allows you to specify the absolute value of the negative dBm for the RSSI threshold, which is the point at which the radio will start the roaming algorithm.

Commands	Details
<b>setvar</b>	This command sets the RSSI threshold value. <b>Format:</b> ! U1 setvar "wlan.roam.rssi" "value" <b>Values:</b> 60 to 125 <b>Default:</b> 74
<b>getvar</b>	This command retrieves the absolute value of the negative dBm for the RSSI threshold. <b>Format:</b> ! U1 getvar "wlan.roam.rssi"

**Example:** In this example, the **setvar** sets the RSSI threshold value to -80 dBm.

```
! U1 setvar "wlan.roam.rssid" "80"
```

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.roam.signal

This printer setting refers to specifying the wireless roam signal.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the wireless roam signal. <b>Format:</b> ! U1 setvar "wlan.roam.signal" "value" <b>Values:</b> Decimal values between 1 and 75 inclusive. <b>Default:</b> "50"
<b>getvar</b>	This command instructs the printer to respond with the specified wireless roam signal. <b>Format:</b> ! U1 getvar "wlan.roam.signal"

**Example:** This **setvar** example shows the value set to "50".

```
! U1 setvar "wlan.roam.signal" "50"
```

When the **setvar** value is set to "50", the **getvar** result is "50".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.security

This printer setting allows you to specify both the wireless encryption type and authentication type in one command.

**Note** • The supporting parameters that are required vary based on the security type that you select. See *Supporting SGD Commands for Different Security Types* on page 1264 for instructions for each security type.

When using certificate files, Zebra printers support:

- using Privacy Enhanced Mail (PEM) formatted certificate files.
- using the client certificate and private key as two files, each downloaded separately.
- using exportable PAC files for EAP-FAST.

These certificate files can only be sent using ZPL, not SGD. The ZPL command to use when sending these certificate files is the **~DY** command.

Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

**Important** • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the wireless security value.</p> <p><b>Format:</b> ! U1 setvar "wlan.security" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>"1" = No wireless security or "none"</li> <li>"2" = WEP 40-bit or "wep 40-bit"</li> <li>"3" = WEP 128-bit or "wep 128-bit"</li> <li>"4" = EAP-TLS or "eap-tls"</li> <li>"5" = EAP-TTLS or "eap-ttls"</li> <li>"6" = EAP-FAST or "eap-fast"</li> <li>"7" = PEAP or "peap"</li> <li>"8" = LEAP or "leap"</li> <li>"9" = WPA PSK or "wpa psk" (Key rotation for WPA2 PSK is supported in firmware versions V53.15.8Z , V60.15.8Z, and later.)</li> <li>"10" = WPA EAP-TLS or "wpa eap-tls"</li> <li>"11" = WPA EAP-TTLS or "wpa eap-ttls"</li> <li>"12" = WPA EAP-FAST or "wpa eap-fast"</li> <li>"13" = WPA PEAP or "wpa peap"</li> <li>"14" = WPA LEAP or "wpa leap"</li> <li>"15" = Kerberos or "kerberos"</li> </ul> <p><b>Default:</b> "1"</p>
<b>getvar</b>	<p>This command instructs the printer to return the name and not the type. If an invalid security mode is entered the printer returns Invalid Mode.</p> <p><b>Format:</b> ! U1 getvar "wlan.security" "value"</p>

→ **Example:** This `setvar` example shows the value set to "1".

```
! U1 setvar "wlan.security" "1"
```

When the `setvar` value is set to "1", the `getvar` result is "none".

**Note •**

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## Supporting SGD Commands for Different Security Types

The supporting SGD commands required for `wlan.security` vary based on the security type that you select. You must send the additional commands for your printer to be able to work on your wireless network. Follow the example and format for your specific security type in this section, substituting your own wireless network data.

---

### Security Type 1: No Wireless Security Active

Additional parameters that need to be set: none

→ **Example:** This example turns off all wireless securities controlled under this command, but it does not reset the printer's wireless settings to their defaults.

```
! U1 setvar "wlan.security" "1"
```

---

### Security Type 2: WEP 40-Bit

Additional parameters that need to be set and the SGD commands to use:

- WEP encryption index (see [wlan.wep.index on page 1282](#))
- WEP authentication type (see [wlan.wep.auth\\_type on page 1281](#))
- WEP key type (see [wlan.wep.key\\_format on page 1288](#))
- the actual values of any WEP encryption keys to be used (see [wlan.wep.key1 on page 1283](#), [wlan.wep.key2 on page 1284](#), [wlan.wep.key3 on page 1285](#), or [wlan.wep.key4 on page 1286](#))

**Example:** This example configures the printer for WEP 40-bit encryption using index key 1, open authentication, and a hexadecimal WEP key with a value of "A1B2C3D4F5."

```
! U1 setvar "wlan.security" "2"  
! U1 setvar "wlan.wep.index" "1"  
! U1 setvar "wlan.wep.auth_type" "open"  
! U1 setvar "wlan.wep.key_format" "hex"  
! U1 setvar "wlan.wep.key1" "A1B2C3D4F5"
```

---

### Security Type 3: WEP 128-Bit

Additional parameters that need to be set and the SGD commands to use:

- WEP encryption index (see [wlan.wep.index](#) on page 1282)
- WEP authentication type (see [wlan.wep.auth\\_type](#) on page 1281)
- WEP key type (see [wlan.wep.key\\_format](#) on page 1288)
- the actual values of any WEP encryption keys to be used (see [wlan.wep.key1](#) on page 1283, [wlan.wep.key2](#) on page 1284, [wlan.wep.key3](#) on page 1285, or [wlan.wep.key4](#) on page 1286)

**Example:** This example configures the printer for WEP 128-bit encryption using index key 2, open authentication, and four hexadecimal WEP keys.

```
! U1 setvar "wlan.security" "3"  
! U1 setvar "wlan.wep.index" "2"  
! U1 setvar "wlan.wep.auth_type" "open"  
! U1 setvar "wlan.wep.key_format" "hex"  
! U1 setvar "wlan.wep.key1" "001122334455667788"  
! U1 setvar "wlan.wep.key2" "112233445566778899"  
! U1 setvar "wlan.wep.key3" "223344556677889900"  
! U1 setvar "wlan.wep.key4" "334455667788990011"
```

---

### Security Type 4: EAP-TLS

Additional parameters that need to be set and the SGD commands to use:

- optional private key password (see [wlan.private\\_key\\_password](#) on page 1255)

→ **Example:** This example configures the printer for EAP-TLS authentication with an optional private key password with a value of “**private**.”

```
! U1 setvar "wlan.security" "4"  
! U1 setvar "wlan.private_key_password" "private"
```

---

## Security Type 5: EAP-TTLS

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)

→ **Example:** This example configures the printer for EAP-TTLS authentication, including a user ID with a value of “**user**” and a password with a value of “**password**.”

```
! U1 setvar "wlan.security" "5"  
! U1 setvar "wlan.username" "user"  
! U1 setvar "wlan.password" "password"
```

---

## Security Type 6: EAP-FAST

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)
- optional private key password (see [wlan.private\\_key\\_password](#) on page 1255)

→ **Example:** This example configures the printer for EAP-FAST authentication, including a user ID of “**user**,” a password of “**password**,” and an optional private key of “**private**.”

```
! U1 setvar "wlan.security" "6"  
! U1 setvar "wlan.username" "user"  
! U1 setvar "wlan.password" "password"  
! U1 setvar "wlan.private_key_password" "private"
```

---

## Security Type 7: PEAP

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)

→ **Example:** This example configures the printer for PEAP authentication, including a user ID with a value of “user” and a password with a value of “password.”

```
! U1 setvar "wlan.security" "7"  
! U1 setvar "wlan.username" "user"  
! U1 setvar "wlan.password" "password"
```

---

## Security Type 8: LEAP

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)

→ **Example:** This example configures the printer for LEAP authentication, including a user ID with a value of “user” and a password with a value of “password.”

```
! U1 setvar "wlan.security" "8"  
! U1 setvar "wlan.username" "user"  
! U1 setvar "wlan.password" "password"
```

---

## Security Type 9: WPA PSK

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments. Key rotation for WPA2 PSK is supported in firmware version 60.15.8Z and later and in firmware version 53.15.8Z and later.

Additional parameters that need to be set and the SGD commands to use:

- Pre-Shared Key (PSK) value (see [wlan.wpa.psk](#) on page 1287)

→ **Example:** This example configures the printer for WPA PSK authentication with a PSK value of all zeroes (64 hexadecimal digits).

```
! U1 setvar "wlan.security" "9"  
! U1 setvar "wlan.wpa.psk" "00000000..."
```

---

## Security Type 10: WPA EAP-TLS

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

Additional parameters that need to be set and the SGD commands to use:

- optional private key password (see [wlan.private\\_key\\_password](#) on page 1255)

**Example:** This example configures the printer for WPA EAP-TLS authentication with an optional private key password with a value of “**private**.”

```
! U1 setvar "wlan.security" "10"  
! U1 setvar "wlan.private_key_password" "private"
```

---

## Security Type 11: WPA EAP-TTLS

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)

**Example:** This example configures the printer for WPA EAP-TTLS authentication, including a user ID with a value of “**user**” and a password with a value of “**password**.”

```
! U1 setvar "wlan.security" "11"  
! U1 setvar "wlan.username" "user"  
! U1 setvar "wlan.password" "password"
```

---

## Security Type 12: WPA EAP-FAST

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)

- optional private key password (see [wlan.private\\_key\\_password](#) on page 1255)

→ **Example:** This example configures the printer for WPA EAP-FAST authentication, including a user ID of "user," a password of "password," and an optional private key of "private."

```
! U1 setvar "wlan.security" "12"
! U1 setvar "wlan.username" "user"
! U1 setvar "wlan.password" "password"
! U1 setvar "wlan.private_key_password" "private"
```

---

## Security Type 13: WPA PEAP

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)

→ **Example:** This example configures the printer for WPA PEAP authentication, including a user ID with a value of "user" and a password with a value of "password."

```
! U1 setvar "wlan.security" "13"
! U1 setvar "wlan.username" "user"
! U1 setvar "wlan.password" "password"
```

---

## Security Type 14: WPA LEAP

**Note** • Configuring the printer for WPA also allows the printer to be used in WPA2 environments.

Additional parameters that need to be set and the SGD commands to use:

- user ID (see [wlan.username](#) on page 1278)
- password (see [wlan.password](#) on page 1251)

→ **Example:** This example configures the printer for WPA LEAP authentication, including a user ID with a value of “**user**” and a password with a value of “**password**.”

```
! U1 setvar "wlan.security" "14"  
! U1 setvar "wlan.username" "user"  
! U1 setvar "wlan.password" "password"
```

---

## Security Type 15: Kerberos

Additional parameters that need to be set and the SGD commands to use:

- Kerberos user ID (see [wlan.kerberos.username](#) on page 1244)
- Kerberos password (see [wlan.kerberos.password](#) on page 1242)
- realm (see [wlan.kerberos.realm](#) on page 1243)
- Key Distribution Center (KDC) (see [wlan.kerberos.kdc](#) on page 1240)

→ **Example:** This example configures the printer for Kerberos encryption, including a Kerberos user ID with a value of “**user**,” a Kerberos password with a value of “**password**,” a realm of “**zebra**,” and a KDC of “**krbtgt**.”

```
! U1 setvar "wlan.security" "15"  
! U1 setvar "wlan.kerberos.username" "user"  
! U1 setvar "wlan.kerberos.password" "password"  
! U1 setvar "wlan.kerberos.realm" "zebra"  
! U1 setvar "wlan.kerberos.kdc" "krbtgt"
```

## wlan.signal\_noise

This command returns the signal noise on the wireless network. Values above 40% represent a very significant noise, and radio communication is not reliable.

### getvar

Commands	Details
getvar	This command instructs the printer to return the current signal noise on the wireless network. <b>Format:</b> ! U1 getvar "wlan.signal_noise"

**Example:** In this example, the getvar result is the current signal\_noise value.

```
! U1 getvar "wlan.signal_noise"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.signal\_quality

This command instructs the printer to return the current signal quality of the wireless network. Values below 40% represent a very poor signal quality, and radio communication is not reliable.

### getvar

Commands	Details
getvar	This command instructs the printer to return the current signal quality of the wireless network. <b>Format:</b> ! U1 getvar "wlan.signal_quality"

**Example:** In this example, the getvar result is the current signal\_quality value.

```
! U1 getvar "wlan.signal_quality"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.signal\_strength

This command returns the signal strength of the connection to the access point as a percentage value between zero (not connected) and 100 (strongest signal). Values below 40% represent a very poor signal and radio communication is not reliable.

### getvar

Commands	Details
<b>getvar</b>	This command instructs the printer to respond with the current signal strength. <b>Format:</b> ! U1 getvar "wlan.signal_strength"

**Example:** In this example, the getvar result is "93".

```
! U1 getvar "wlan.signal_strength"
```

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.station\_name

This printer setting refers to the station name.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the station name. <b>Format:</b> ! U1 setvar "wlan.station_name" "value" <b>Values:</b> A maximum of 32 alphanumeric characters <b>Default:</b> "ZEBRA"
<b>getvar</b>	This command instructs the printer to respond with the station name value. <b>Format:</b> ! U1 getvar "wlan.station_name"

**Example:** This **setvar** example shows the value set to "ZEBRA".

```
! U1 setvar "wlan.station_name" "ZEBRA"
```

When the **setvar** value is set to "ZEBRA", the **getvar** result is "ZEBRA".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.tx\_power

This printer setting refers to specifying the wireless transmit power.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the wireless transmit power. <b>Format:</b> ! U1 setvar "wlan.tx_power" "value" <b>Values:</b> Decimal values of 1, 5, 20, 30, 50, 100 <b>Default:</b> "100"
<b>getvar</b>	This command instructs the printer to respond with the wireless transmit power. <b>Format:</b> ! U1 getvar "wlan.tx_power"

**Example:** This **setvar** example shows the value set to "100".

```
! U1 setvar "wlan.tx_power" "100"
```

When the **setvar** value is set to "100", the **getvar** result is "100".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.tx\_rate

This printer setting refers to specifying the wireless transmit rate.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the wireless transmit rate. <b>Format:</b> ! U1 setvar "wlan.tx_rate" "value" <b>Values:</b> 1, 2, 5.5, 11, all <b>Default:</b> "all"
<b>getvar</b>	This command instructs the printer to respond with the wireless transmit rate. <b>Format:</b> ! U1 getvar "wlan.tx_rate"

**Example:** This **setvar** example shows the value set to "all".

```
! U1 setvar "wlan.tx_rate" "all"
```

When the **setvar** value is set to "all", the **getvar** result is "all".

### Note •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.user\_channel\_list

This command sets the list of available channels.

### Related Commands:

- [wlan.active\\_channels](#) on page 1186
- [wlan.allowed\\_band](#) on page 1191
- [wlan.permitted\\_channels](#) on page 1252

Commands	Details
<b>setvar</b>	This command sets the list of available channels. <b>Format:</b> ! U1 setvar "wlan.user_channel_list" "value" <b>Values:</b> One or more of the following: <b>1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,56,60,64,100,104,108,112,116,132,136,140,149,153,157,161,165,all</b> <b>Default:</b> "all"
<b>getvar</b>	This command retrieves the currently set list of available channels. <b>Format:</b> ! U1 getvar wlan.user_channel_list"

**Example:** This example sets the available channel list to channels 1-9.

```
! U1 setvar "wlan.user_channel_list" "1,2,3,4,5,6,7,8,9"
```

### Supported Devices ZT200 Series

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.username

This printer setting refers to the generic user name that is used by the wireless securities that need a user name.

**Important** • Kerberos has its own user name field.

Commands	Details
<b>setvar</b>	This command instructs the printer to set a generic user name for wireless securities that need a user name. <b>Format:</b> ! U1 setvar "wlan.username" "value" <b>Values:</b> A maximum of 32 alphanumeric characters <b>Default:</b> "user"
<b>getvar</b>	This command instructs the printer to respond with a generic user name for the wireless securities that need a user name. <b>Format:</b> ! U1 getvar "wlan.username"

**Example:** This **setvar** example shows the value set to "user".

```
! U1 setvar "wlan.username" "user"
```

When the **setvar** value is set to "user", the **getvar** result is "user".

**Note** •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.waveagent.enable

This command enables/disables the internal agent for support of Veriwave's WaveDeploy system. WaveDeploy is a software product used for performing network site surveys.

Commands	Details
<b>setvar</b>	This command enables or disables internal agent support for waveagent. <b>Format:</b> ! U1 setvar "wlan.waveagent.enable" "value" <b>Values:</b> "off" "on" <b>Default:</b> "off"
<b>getvar</b>	This command instructs the printer to respond with the current waveagent support status. <b>Format:</b> ! U1 getvar "wlan.waveagent.enable"

### Example:

```
! U1 setvar "wlan.waveagent.enable" "on"
```

**Supported Devices** ZT200 Series

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.waveagent.udp\_port

This command specifies the UDP port number used by WaveAgent.

Commands	Details
<b>setvar</b>	This command specifies the port to be used by WaveAgent. <b>Format:</b> ! U1 setvar "wlan.waveagent.udp_port" "value" <b>Values:</b> "1" to "64000" <b>Default:</b> "18100"
<b>getvar</b>	This command instructs the printer to respond with the current port setting for WaveAgent. <b>Format:</b> ! U1 getvar "wlan.waveagent.udp_port"

**Example:** This **setvar** example shows the value set to "on".

```
! U1 setvar "wlan.waveagent.udp_port" "21000"
```

**Supported Devices** ZT200 Series

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wep.auth\_type

For the WEP security type, this printer setting selects the authentication type to be used between the printer and the access point. The authentication types are open system and shared key.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the WEP authentication type. <b>Format:</b> ! U1 setvar "wlan.wep.auth_type" "value" <b>Values:</b> "open" = enables the open authentication type "shared" = enables the shared authentication type <b>Default:</b> "open"
<b>getvar</b>	This command instructs the printer to retrieve the current WEP authentication type. <b>Format:</b> ! U1 getvar "wlan.wep.auth_type"

**Example:** This **setvar** example shows the value set to "open".

```
! U1 setvar "wlan.wep.auth_type" "open"
```

When the **setvar** value is set to "open", the **getvar** result is "open".

### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wep.index

This printer setting refers to the WEP (Wired Equivalent Privacy) encryption key index. This printer setting determines which one of the four encryption keys is to be used by the client (printer).

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the encryption key index.</p> <p><b>Format:</b> ! U1 setvar "wlan.wep.index" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"><li>"1" = enables encryption key 1</li><li>"2" = enables encryption key 2</li><li>"3" = enables encryption key 3</li><li>"4" = enables encryption key 4</li></ul> <p><b>Default:</b> "1"</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the encryption key index.</p> <p><b>Format:</b> ! U1 getvar "wlan.wep.index"</p>

**Example:** This **setvar** example shows the value set to "1".

```
! U1 setvar "wlan.wep.index" "1"
```

When the **setvar** value is set to "1", the **getvar** result is "1".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wep.key1

This printer setting refers to the first indexed WEP encryption key. The WEP encryption key is a hexadecimal or string value. This key should match the wireless network WEP encryption key 1.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the encryption key.</p> <p><b>Format:</b> ! U1 setvar "wlan.wep.key1" "value"</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>10 hexadecimal characters for 40-bit encryption</li> <li>26 hexadecimal characters for 128-bit encryption</li> </ul> <p><b>Default:</b> All zeros</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the encryption key.</p> <p><b>Format:</b> ! U1 getvar "wlan.wep.key1"</p> <p>For protection a single "*" prints.</p>

**Example:** This **setvar** example shows the value set to "A1B2C3D4F5".

```
! U1 setvar "wlan.wep.key1" "A1B2C3D4F5"
```

When the **setvar** value is set to "A1B2C3D4F5", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wep.key2

This printer setting refers to the second indexed WEP encryption key. The WEP encryption key is a hexadecimal string value. This key should match the wireless network WEP encryption key 2.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the encryption key. <b>Format:</b> ! U1 setvar "wlan.wep.key2" "value" <b>Values:</b> 10 hexadecimal characters for 40-bit encryption 26 hexadecimal characters for 128-bit encryption <b>Default:</b> All zeros
<b>getvar</b>	This command instructs the printer respond with the encryption key. <b>Format:</b> ! U1 getvar "wlan.wep.key2" For protection a single "*" prints.

**Example:** This **setvar** example shows the value set to "A1B2C3D4F5".

```
! U1 setvar "wlan.wep.key2" "A1B2C3D4F5"
```

When the **setvar** value is set to "A1B2C3D4F5", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wep.key3

This printer setting refers to the third indexed WEP encryption key. The WEP encryption key is a hexadecimal string value. This key should match the wireless network WEP encryption key 3.

Commands	Details
<b>setvar</b>	<p>This command instructs the printer to set the encryption key.  <b>Format:</b> ! U1 setvar "wlan.wep.key3" "value"  <b>Values:</b>            10 hexadecimal characters for 40-bit encryption            26 hexadecimal characters for 128-bit encryption  <b>Default:</b> All zeros</p>
<b>getvar</b>	<p>This command instructs the printer to respond with the encryption key.  <b>Format:</b> ! U1 getvar "wlan.wep.key3"            For protection a single "*" prints.</p>

**Example:** This **setvar** example shows the value set to "A1B2C3D4F5".

```
! U1 setvar "wlan.wep.key3" "A1B2C3D4F5"
```

When the **setvar** value is set to "A1B2C3D4F5", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wep.key4

This printer setting refers to the fourth indexed WEP encryption key. The WEP encryption key is a hexadecimal string value. This key should match the wireless network WEP encryption key 4.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the encryption key. <b>Format:</b> ! U1 setvar "wlan.wep.key4" "value" <b>Values:</b> 10 hexadecimal characters for 40-bit encryption 26 hexadecimal characters for 128-bit encryption <b>Default:</b> All zeros
<b>getvar</b>	This command instructs the printer respond with the encryption key. <b>Format:</b> ! U1 getvar "wlan.wep.key4" For protection a single "*" prints.

**Example:** This **setvar** example shows the value set to "A1B2C3D4F5".

```
! U1 setvar "wlan.wep.key4" "A1B2C3D4F5"
```

When the **setvar** value is set to "A1B2C3D4F5", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wpa.psk

This printer setting specifies the pre-shared key (PSK) value to use when the WPA authentication is set to PSK.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the pre-shared key. <b>Format:</b> ! U1 setvar "wlan.wpa.psk" "value" <b>Values:</b> 64 hexadecimal digits <b>Default:</b> 64 zeros (00000000...)
<b>getvar</b>	This command instructs the printer to respond with the pre-shared key. <b>Format:</b> ! U1 getvar "wlan.wpa.psk" For protection a single "*" prints.

**Example:** This **setvar** example shows the value set to "00000000...".

```
! U1 setvar "wlan.wpa.psk" "00000000..."
```

When the **setvar** value is set to "00000000...", the **getvar** result is "\*".

**Note •**

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

## wlan.wep.key\_format

This printer setting specifies the format for the WEP key.

**Important** • This printer setting should proceed any of the **wep.key** settings if you select a non-default value.

Commands	Details
<b>setvar</b>	This command instructs the printer to set the WEP key format. <b>Format:</b> ! U1 setvar "wlan.wep.key_format" "value" <b>Values:</b> "ascii" = WEP key is set by ASCII string "hex" = WEP key is a Hex string <b>Default:</b> "hex"
<b>getvar</b>	This command instructs the printer to respond with the WEP key format. <b>Format:</b> ! U1 getvar "wep.key_format"

**Example:** This **setvar** example shows the value set to "ascii".

**! U1 setvar "wlan.wep.key\_format" "ascii"**

When the **setvar** value is set to "ascii", the **getvar** result is "ascii".

**Note** •

- For printer support, see [SGD Command Support on page 1365](#).
- For details on SGD command structure, see [Command Structure on page 611](#).

## wlan.wpa.wpa\_version

Returns the currently active WPA version.

Commands	Details
getvar	<b>Format:</b> ! U1 getvar "wlan.wpa.wpa_version" <b>Values:</b> "WPA": WPA being used. "WPA2": WPA2 being used. "": Reported if wireless LAN is not connected or WPA is not enabled.

### Supported Devices

- iMZ220, iMZ320
- QLn220, QLn320
- ZD410, ZD420
- ZD500
- ZQ510, ZQ520
- ZR338
- ZR628, ZR638
- ZT210, ZT220, ZT230
- ZT410, ZT420

#### Note •

- For printer support, see [SGD Command Support](#) on page 1365.
- For details on SGD command structure, see [Command Structure](#) on page 611.

# Zebra Code Pages

This section provides you with a visual of the different Zebra Code pages.

# **ASCII**

This section shows the American Standard Code for Information Interchange (ASCII) code used by Zebra printers.

## ASCII Code Chart

Shaded areas in [Table 32](#) indicate characters not recommended for command prefix, format prefix, or delimiter characters.

**Table 32 • ASCII Code Chart**

## Standard Printer Fonts

Most Zebra printers come standard with 15 bitmapped fonts and one scalable font, see [Figure 3](#). Additional downloadable bitmapped and scalable fonts are also available. Character size and density (how dark it appears) depend on the density of the printhead and the media used.

**Figure 3 • Examples of the Standard Printer Fonts**

To use one of these fonts, you must either use the change alphanumeric default font command (^CF) or specify an alphanumeric field command (^A).

The standard Zebra character set is Code 850 for character values greater than 20 HEX. There are six HEX character values below 20 HEX that are also recognized. [Figure 4](#) shows how these character values are printed.

**Note •** Unidentified characters should default to a space.

Figure 4 • Recognized HEX Values below 20 HEX

A HEX	1a	will print a	0 (numeric)
A HEX	1b	will print a	%
A HEX	1c	will print a	%
A HEX	1d	will print a	IJ
A HEX	1e	will print a	ij
A HEX	1f	will print a	\

## Proportional and Fixed Spacing

Proportional spacing is different than fixed spacing. In [Table 33](#), the intercharacter gap (ICG), the space between characters, is constant for fonts A through H, which means that the spacing between all characters is the same. For example, the spacing between the letters **MW** is the same as between the letters **IE**.

[Figure 5](#) is an example of fixed space fonts:

**Figure 5 • Fixed Space Fonts Proportion**

The baseline is the imaginary line on which the bottom (base) of all characters (except any descenders) rest. The area between the baseline and the bottom of the matrix is used for any character “descenders.” Baseline numbers define where the baseline is located in relationship to the top of the matrix. For example, the baseline for font “E” is 23 dots down from the top of the matrix.

**Table 33 • Intercharacter Gap and Baseline Parameters**

Font	H x W (in dots)	Type	Intercharacter Gap (in dots)	Baseline (in dots)
A	9 x 5	U-L-D	1	7
B	11 x 7	U	2	11
C,D	18 x 10	U-L-D	2	14
E	28 x 15	OCR-B	5	23
F	26 x 13	U-L-D	3	21
G	60 x 40	U-L-D	8	48
H	21 x 13	OCR-A	6	21
GS	24 x 24	SYMBOL	PROPORTIONAL	3 x HEIGHT/4
0	DEFAULT: 15 x 12		PROPORTIONAL	3 x HEIGHT/4

## Scalable Versus Bitmapped Fonts

For scalable fonts, setting the height and width equally produces characters that appear the most balanced. Balanced characters are pleasing to the eye because actual height and width are approximately equal to each other. This is achieved through the use of a smooth-scaling algorithm in the printer.

For bitmapped fonts, this balancing is built into the font. In actuality, the height of a bitmap font is slightly larger than the width. Bitmap fonts are always at the maximum size of the character's cell.

### Scalable Fonts

All dot parameters used in the commands to create scalable fonts are translated into a point size because scalable fonts are measured in point sizes, not dots. To determine how many dots to enter to obtain a particular point size, use the following formula. The actual point size will be an approximate value.

$$\text{Dots} = \frac{(\text{Point size}) \times (\text{Dots per inch of Printer})}{72}$$

- For printers using a 6 dot/mm printhead the “dots per inch of printer” value is 152.4
- For printers using a 8 dot/mm printhead the “dots per inch of printer” value is 203.2
- For printers using a 12 dot/mm printhead the “dots per inch of printer” value is 304.8
- For printers using a 24 dot/mm printhead the “dots per inch of printer” value is 609.6

The actual height and width of the character in dots will vary, depending on the font style and the particular character. Therefore, some characters will be smaller and some will be larger than the actual dot size requested. The baselines for all scalable fonts are calculated against the dot size of the cell. The baseline is 3/4 down from the top of the cell. For example, if the size of the cell is 80 dots, the baseline will be 60 dots (3/4) down from the top of the cell.

For more information concerning fonts and related commands, see [~DB on page 164](#) and [~DS on page 173](#).

### Bitmapped Fonts

Internal bitmapped fonts can be magnified from 1 to 10 times their normal (default) size. The magnification factor is in whole numbers. Therefore, if the normal size of a bitmapped font is 9 dots high and 5 dots wide, a magnification factor of 3 would produce a character of 27 dots high and 15 dots wide. Height and width can be magnified independently.

#### Magnification Factor

The font commands contain parameters for entering the height and width of printed characters. The values are always entered in dots. When entering these values for bitmapped fonts, use the following formula:

$$\text{Base Height} \times \text{Magnification Factor} = \text{Height Parameter Value}$$

The same principle applies when calculating width.

Example:

Base height = 9 dots  
Base width = 5 dots

To magnify a bitmapped character with the above specifics 3 times its size:

Height parameter = 27 [9 x 3]  
Width parameter = 15 [5 x 3]

## Changing Bitmapped Font Size

Alphanumeric field command (^A) parameters h and w control the magnification and, therefore, the ultimate size of the font. The parameter is specified in dots, but ZPL II actually uses an integer multiplier times the original height/width of the font. For example, if you specify

`^AD,54`

you get characters three times their normal size (54 dots high), but if you specify

`^AD,52`

you receive the same result, not characters 52 dots high.

Defining only the height or width of a bitmapped font forces the magnification to be proportional to the parameter defined. If neither is defined, the ^CF height and width are used. For example, if the height is twice the standard height, the width will be twice the standard width.

**Example:** If a ^CF command, with height and width parameters defined, is used to set the first font, any ^A commands (to select a different font) that follow must have the height and width parameter filled in.

If this is not done, the newly selected font will be magnified using values for the ^CF height and width parameters. This is an example of what happens:

ZPL II CODE	GENERATED LABEL
<pre><code>^XA^LL1800 ^FO50,50^CFD,26,10^FDZEBRA....^FS ^FO50,100^FD"Bar Code, Bar None"^FS ^FO50,200^AA^FDZEBRA....^FS ^FO50,250^FD"Bar Code, Bar None"^FS ^XZ</code></pre>	<p>ZEBRA....</p> <p>"Bar Code, Bar None"</p> <p>ZEBRA....</p> <p>"Bar Code, Bar None"</p>

## Font Matrices

Type Key **U** = Uppercase, **L** = Lowercase, **D** = Descenders

Table 34 • 6 dot/mm Printhead

Font	Matrix	Type	Character Size

## Bar Codes

Every bar code contains data made up of a sequence of light spaces and dark bars that represent letters, numbers, or other graphic characters. The usable characters differ among the various kinds of bar codes. Each bar code section in the [ZPL Commands on page 43](#) provides a table of applicable characters. Start and stop characters and check digits are used by many, but not all, bar codes. These will be indicated in the specific bar code explanations.

Zebra printers can print the following kinds of bar codes:

<b>Bar code modulus “X” dimensions</b> <ul style="list-style-type: none"><li>• Picket fence (non-rotated) orientation:<ul style="list-style-type: none"><li>• 203 dpi = 0.0049 in. mil to 0.049 in.</li><li>• 300 dpi = 0.0033 in. mil to 0.033 in.</li></ul></li><li>• Ladder (rotated) orientation:<ul style="list-style-type: none"><li>• 203 dpi = 0.0049 in. mil to 0.049 in.</li><li>• 300 dpi = 0.0039 in. mil to 0.039 in.</li></ul></li></ul>	<b>Linear bar codes</b> <ul style="list-style-type: none"><li>• Codabar</li><li>• Code 11</li><li>• Code 39</li><li>• Code 93</li><li>• Code 128 with subsets A/B C and UCC Case Codes</li><li>• ISBT-128</li><li>• UPC-A</li><li>• UPC-E</li><li>• EAN-8</li><li>• EAN-13</li><li>• UPC and EAN 2 or 5 digit extensions</li><li>• Planet Code</li><li>• Plessey</li><li>• Postnet</li><li>• Standard 2 of 5</li><li>• Industrial 2 of 5</li><li>• Interleaved 2 of 5</li><li>• LOGMARS</li><li>• MSI</li><li>• GS1 DataBar Omnidirectional</li></ul>
<b>Two-dimensional bar codes</b> <ul style="list-style-type: none"><li>• Aztec</li><li>• Code 49</li><li>• Maxi Code</li><li>• TLC39</li><li>• PDF-417</li><li>• QR Code</li><li>• Codablock</li><li>• DataMatrix</li><li>• Micro-PDF417</li></ul>	
<b>Bar code ratios</b> <ul style="list-style-type: none"><li>• 2:1</li><li>• 7:3</li><li>• 5:2</li><li>• 3:1</li></ul>	

## Basic Format for Bar Codes

The basic format for bar codes is quiet zone, start character, data, check digit, stop character, and quiet zone. Not all bar codes require each of these elements.

Every bar code requires a quiet zone. A quiet zone (sometimes called a “clear area”) is an area adjacent to the machine-readable symbols that ensure proper reading (decoding) of the symbols. No printing is permissible within this area. Preprinted characters, borders, and background color are acceptable if they are invisible to the reading device; these are used in some applications but restrict the type of reading device that can be used. The size of the quiet zone depends on the size of bar widths (usually 10 times the width of the narrow bar).

Figure 6 • Quiet Zone in a Bar Code

## Bar Code Field Instructions

To create a bar code, a bar code field command must be contained in the label format. [Table 38](#) shows the bar code field commands. The number in brackets denotes the print ratio. Each command produces a unique bar code.

**Important** • (\*) for Fixed Printing Ratio means that the ratio between the width of the bars in the code is a fixed standard and cannot be changed.

As another reference to the bar code field commands ratio, see [Table 12 on page 143](#).

Table 38 • Bar Code Field Commands

ZPL Command	Command Description	Ratio
<code>^B0</code>	Aztec Bar Code Parameters	[Fixed]
<code>^B1</code>	Code 11 (USD-8)	[2.0 - 3.0]
<code>^B2</code>	Interleaved 2 of 5	[2.0 - 3.0]
<code>^B3</code>	Code 39 (USD-3 and 3 of 9)	[2.0 - 3.0]
<code>^B4</code>	Code 49 (*)	[Fixed]
<code>^B5</code>	Planet Code Bar Code	[Fixed]
<code>^B7</code>	PDF417 (*)	[Fixed]
<code>^B8</code>	EAN-8 (*)	[Fixed]
<code>^B9</code>	UPC-E	[Fixed]
<code>^BA</code>	Code 93 (USS-93)(*)	[Fixed]
<code>^BB</code>	CODABLOCK A, E, F (*)	[Fixed]
<code>^BC</code>	Code 128 (USD-6) (*)	[Fixed]
<code>^BD</code>	UPS MaxiCode (*)	[Fixed]
<code>^BE</code>	EAN-13	[Fixed]
<code>^BF</code>	Micro-PDF417	[Fixed]

**Table 38 • Bar Code Field Commands (Continued)**

ZPL Command	Command Description	Ratio
<b>^BI</b>	Industrial 2 of 5	[2.0 - 3.0]
<b>^BJ</b>	Standard 2 of 5	[2.0 - 3.0]
<b>^BK</b>	ANSI Codabar (USD-4 and 2 of 7)	[2.0 - 3.0]
<b>^BL</b>	LOGMARS	[2.0 - 3.0]
<b>^BM</b>	MSI	[2.0 - 3.0]
<b>^BO</b>	Aztec Bar Code Parameters	[Fixed]
<b>^BP</b>	Plessey	[2.0 - 3.0]
<b>^BQ</b>	QR Code (*)	[Fixed]
<b>^BR</b>	GS1 Databar (formerly RSS)	[Fixed]
<b>^BS</b>	UPC/EAN Extensions (*)	[Fixed]
<b>^BU</b>	UPC-A (*)	[Fixed]
<b>^BX</b>	Data Matrix (*)	[Fixed]
<b>^BZ</b>	PostNet (*), USPS Intelligent Mail, and Planet bar codes	[Fixed]

Additionally, each bar code field command can be issued with a definition parameter string. The parameter string defines field rotation, height, and interpretation line status for all bar codes. For some bar codes, the parameter string also sets a check digit, start character, and/or stop character. Use the definition parameter string to command the printer to print bar codes of appropriate heights and densities that conform to the specifications of the application.

The use of the parameter string is optional because all parameters have default values. If the default values for all of the bar code parameters suit the application, then only the bar code command needs to be entered.

Parameters in bar code field commands are “position specific.” If a value (other than the default value) is manually entered for one parameter the ZPL II delimiter character (a comma) must be used to mark the position of the preceding parameters in the string.

To change just the third parameter, enter two commas and then the value for the third parameter. The default values will be automatically used for the first and second parameters.

## Bar Code Command Groups

Bar code commands are organized into four groups. Each group represents a type of bar code. Table 39 through Table 42 identify the groups and the bar codes they contain:

**Table 39 • Numeric Only Bar Codes**

ZPL Command	Command Description
<b>^B0</b>	Aztec Bar Code Parameters
<b>^B1</b>	Code 11

# **Mod 10 and Mod 43 Check Digits**

This section provides information about Mod 10 and Mod 43 check digits.

## **Mod 10 Check Digit**

The calculations for determining the Mod 10 Check Digit character are as follows:

### **Contents**

Mod 10 Check Digit .....	1323
Mod 43 Check Digit .....	1324

1. Start at the first position and add the value of every other position together.  
 $0 + 2 + 4 + 6 + 8 + 0 = 20$
2. The result of Step 1 is multiplied by 3.  
 $20 \times 3 = 60$
3. Start at the second position and add the value of every other position together.  
 $1 + 3 + 5 + 7 + 9 = 25$
4. The results of steps 2 and 3 are added together.  
 $60 + 25 = 85$
5. The check character (12th character) is the smallest number which, when added to the result in step 4, produces a multiple of 10.  
 $85 + X = 90$  (next higher multiple of 10)  
 $X = 5$  Check Character

This bar code illustrates the above example. The digit on the right (5) is the check digit.

## Mod 43 Check Digit

The calculations for determining the Mod 43 check Digit character are as follows:

Each character in the Code 39 character set has a specific value, as follows:

0=0	B=11	M=22	X=33
1=1	C=12	N=23	Y=34
2=2	D=13	O=24	Z=35
3=3	E=14	P=25	- =36
4=4	F=15	Q=26	. =37
5=5	G=16	R=27	Space=38
6=6	H=17	S=28	\$=39
7=7	I=18	T=29	/=40
8=8	J=19	U=30	+ =41
9=9	K=20	V=31	%=42
A=10	L=21	W=32	

**Example:** Data string 2345ABCDE/

1. Add the sum of all the character values in the data string. Using the chart above, the sum of the character values is as follows:  
$$1 + 2 + 3 + 4 + 5 + 10 + 11 + 12 + 13 + 14 + 40 = 115$$
2. Divide the total by 43. Keep track of the remainder.  
$$115/43 = 2 \text{ Remainder is } 29$$
3. The “check digit” is the character that corresponds to the value of the remainder.  
Remainder = 29  
29 is the value for the letter T.  
T is the check digit.

Below is a bar code that illustrates the example. The character on the right, T, is the check digit.

^F0125,100^B3N,Y,150,Y,N^FD12345ABCDE/^FS

## Introduction

There are many instances when it is vitally important that the information sent to the Zebra printer is received completely Error-Free. ZPL II supports an error detection protocol called Zebra Packet Response Protocol to meet this need.

**Note** • This protocol only works when using serial interface. It does not function when using parallel interface.

## What is a Protocol?

A protocol is a precisely defined set of rules. In the case of data communications, a Protocol defines how data is transmitted, received, and acknowledged between two devices.

The sole purpose of the Packet Response Protocol is to ensure that the information sent from a Host computer to the Zebra printer is received accurately. Remember, the protocol cannot insure the accuracy of the data that is actually sent from the Host computer. The commands and data needed to make a label (ZPL II Format) are encapsulated within the information sent from the Host computer.

## How Protocols Work

The basic unit of data transfer in the Packet Response Protocol is called a "Transaction." A Transaction is a two-way communication procedure that consists of information being sent from the Host computer to the Zebra printer, and the printer sending back a response to the Host computer. This response is an indication that the Zebra printer has either accepted or rejected the information sent from the Host computer.

Information is sent in the form of "Packets." Packets sent from the Host computer are called Request Packets.

When a Request Packet is received, the Zebra printer analyzes the information in the Packet. If the Request Packet is accepted, the Zebra printer will send a positive response back to the Host computer. The Host computer can then send the next Request Packet. If the information is rejected, the Zebra printer will send a negative response back to the Host computer. The Host computer then sends the same Request Packet again.

The Zebra Packet Response Protocol can be used in both single-printer applications, where there is only one Zebra printer connected to the Host computer, and multi-drop systems in which several Zebra printers are connected to the same Host computer.

## Request Packet Formats from the Host Computer

The first part of each data transfer Transaction is the sending of a Request Packet by the Host computer. The Request Packet contains a fixed length “Header” block and a variable length “Data” block. Each Packet sent from the Host computer to the Zebra printer must always use the following format.

The Request Packet Header Block is comprised of five fixed-length fields. The Request Packet Data Block is comprised of four fixed-length fields and one variable-length field. These fields are defined as follows.

Header Block					Data Block				
SOH	DST. Z-ID	SRC. Z-ID	TYPE	SEQ. #	STX	FORMAT	EXT	CRC	EOT
1	3	3	1	1	1	≤1024	1	2	1

### Header Block Fields

- **SOH** (start of header character)  
The Zebra printer interprets this character as the beginning of a new Request Packet. The ASCII Control Code character SOH (01H) is used as the Start of Header Character.
- **DST. Z-ID** (destination Zebra-ID)  
This is the three-digit ASCII I.D. number used to identify which Zebra printer is to receive the Request Packet. The Zebra printer compares this number to the Network ID number assigned to it during Printer Configuration. The Zebra printer will act on the Request Packet only if these numbers match.
- **SRC. Z-ID** (source Zebra-ID)  
This is a three-digit ASCII number used to identify the Host computer. This number is determined by the user.
- **TYPE** (packet type)  
This field is used to define the type of Request Packet being sent by the Host. Only two characters are valid in this field:
  - ‘P’ indicates a Print Request Packet
  - ‘I’ indicates an Initialize Request Packet
 Most of the Packets sent by the Host to the Zebra printer will be of the ‘P’ variety, requesting a label to be printed.  
The ‘I’ character tells the Zebra printer to initialize the packet sequence numbering. It is required in the first packet of a new printing session, after starting up the Host computer or the Zebra printer.
- **SEQ. #** (the sequence number of the request packet)  
This block contains a single digit number used to denote the current Transaction Number. The Host computer must increment this number by “1” for each new Request/Response Transaction pair, i.e. 0, 1, 2,..., 9. The numbers repeat after every 10 Transactions.

## Data Block Fields

- **STX** (Start of Text)

The Zebra printer interprets this character as the beginning of the variable-length Data Format portion of the Request Packet. The ASCII Control Code character STX (02H) is used as the Start of Text Character.

- **DATA FORMAT** (Label Information)

A variable-length portion of the Request Packet that contains the complete or partial ZPL II label format, or partial data string (such as a downloaded graphic).

This field can contain from 0 to 1024 characters. If the Format of a label is longer than 1024 characters, the Data Format fields from consecutive packets will be concatenated together in the printer's Receive Data Buffer as if they were sent as one long direct transmission.

Special consideration has been given to the possible requirement to include ASCII Control Characters (values less than 20H) in the Data Format portion of a Request Packet.

Characters such as EOT (04H), STX (02H), SOH (01H), and ETX (03H), are part of the Error Detection Protocol and could interrupt normal communication procedures if received at the wrong time.

- **ETX** (End of Text)

The Zebra printer interprets this character as the end of the variable length Data Format portion of the Request Packet. The ASCII Control Code character ETX (03H) is used as the End of Text Character.

- **CRC** (Cyclic Redundancy Check)

The CRC is a 2 character field. A Cyclic Redundancy Check is a type of error checking used to maintain the validity and integrity of the information transmitted between the Host computer and the Zebra printer. This Protocol uses the 16-bit CCITT method of producing a CRC.

The CRC is a two-byte value derived from the contents of the packet between, but not including, the SOH character and the CRC code itself. The Zebra printer will calculate a CRC of the Request Packet received and compare the value with the CRC Value in this field. The CRC of the Request Packet must match the CRC calculated by the Zebra printer in order for the Request Packet to be valid.

- **EOT** (End of Transmission)

The Zebra printer interprets this character as the end of the Request Packet. The ASCII Control Code character EOT (04H) is used as the End of Transmission Character.

## Response From the Zebra Printer

When the Zebra printer receives the EOT character, it will begin acting on the Request Packet received. The printer will compare certain characters and numeric values within the received Request Packet and send a response back to the Host computer.

### Zebra Packet Response

The Packet Response protocol provides the highest degree of error checking and is well suited to the Host-Multiple Printer application. The Response Packet from the Zebra printer will always use the following format.

The Request Packet Header Block is comprised of five fixed-length fields. The Request Packet Data Block is comprised of four fixed-length fields and one variable-length field. These fields are defined as follows.

Header Block					Data Block				
SOH	DST. Z-ID	SRC. Z-ID	TYPE	SEQ. #	STX	FORMAT	EXT	CRC	EOT
1	3	3	1	1	1	≤1024	1	2	1

### Header Block Fields

- **SOH** (Start of Header Character)  
The Zebra printer sends this character as the beginning of a new Response Packet. The ASCII Control Code character SOH (01H) is used as the Start of Header Character.
- **DST. Z-ID** (Destination Zebra-ID)  
This is the same three-digit ASCII number used to identify the Host Computer that was contained in the SRC. Z-ID field of the Request Packet that initiated this Response Packet. The Host compares this number to its known value to insure it is the proper destination.
- **SRC. Z-ID** (Source Zebra-ID)  
This is the three character ASCII Network I.D. of the Zebra printer that is sending the Response Packet.
- **TYPE** (Packet Type)  
This block is used to define the type of Response Packet being sent to the Host. Only three characters are valid in this field.
  - 'A' This is a Positive Acknowledgment to the Host computer. It indicates that the Request Packet was received without a CRC error. The Host computer may send the next Request Packet.
  - 'N' This is the Negative Acknowledgment to the Host computer. It indicates that an error was detected in the packet sent from the Host computer. The Host computer must retransmit the same Request Packet again.
  - 'S' This character indicates that the Response Packet contains the Zebra Printer Status requested by a ~HS (Host Status) command received from the Host.
- **SEQ. #** (Used to denote the current message sequence number)  
This number is identical to the message sequence number in the Request Packet. It denotes the message sequence number to which the Response Packet is replying.

## Data Block Fields

- **STX** (Start of Text)  
The Zebra printer sends this character as the beginning of the variable length Data Format portion of the Response Packet. The ASCII Control Code character STX (02H) is used as the Start of Text Character.
- **DATA FORMAT** (Label Information)  
The ‘variable length’ portion of the Response Packet. If the Packet Type field in the Response Header contains an ‘A’ or an ‘N’, no data will appear in this field. If the Packet Type field contains an ‘S’, this field will contain the Printer Status Message.
- **ETX** (End of Text)  
The Zebra printer sends this character as the end of the variable length Data Format portion of the Request Packet. The ASCII Control Code character ETX (03H) is used as the End of Text Character.
- **CRC** (Cyclic Redundancy Check)  
This is the CRC of the Response Packet as calculated by the Zebra printer. This Cyclic Redundancy Check maintains the validity and integrity of the information transmitted between the Zebra printer and the Host computer.  
This CRC is a two Byte value derived from the contents of the packet between, but not including, the SOH character and the CRC code itself. The Host computer will calculate a CRC of the received Response Packet and compare it to the CRC value in this field. The CRC of the Response Packet must match the CRC calculated by the Host computer in order for the Response Packet to be valid.
- **EOT** (End of Transmission)  
The Zebra printer sends this character as the end of the Response Packet. The ASCII Control Code character EOT (04H) is used as the End of Transmission Character.

## Disguising Control Code Characters

There may be occasions when ASCII Control Codes (00H - 19H) must be included as part of the Data Format block of a Request Packet. To eliminate any problems, these characters must be disguised so that the communication protocol does not act on them.

### This procedure must be used to disguise each Control Code.

- A SUB (1AH) character must precede each Control Code placed in the Data Format block.
- The value of 40H must be added to the Hex value of the Control Code.
- The ASCII Character corresponding to the total value produced in step 2 must be entered in the Data Format right after the SUB character.

The Zebra printer automatically converts the modified control character back to its correct value by discarding the SUB (1AH) character and subtracting 40H from the next character.

**Example:** To include a DLE (10H) character in the Data Format block:

1. Enter a SUB (1AH) character into the Data Format.
2. Add 40H to the DLE value of 10H for a resulting value of 50H.
3. Enter the ASCII character "P" (50H) in the Data Format after the SUB character.

**Note** • This technique is counted as two characters of the 1024 allowed in the Data Format block.

## Rules for Transactions

- Every Transaction is independent of every other Transaction and can only be initiated by the Host computer.
- A valid Response Packet must be received by the Host computer to complete a Transaction before the next Request Packet is sent.
- If an error is encountered during a Transaction, the entire Transaction (i.e., Request Packet and Response Packet) must be repeated.
- The Zebra printer does not provide for system time-outs and has no responsibility for insuring that its Response Packets are received by the Host computer.
- The Host computer must provide time-outs for all of the Transactions and insure that communication continues.
- If any part of a Transaction is lost or received incorrectly, it is the responsibility of the Host computer to retry the whole Transaction.

## Error Detection Protocol Application

The following are the basic requirements for setting up the Zebra printer to use the Error Detection Protocol.

**Activating the Protocol** Protocol is a front panel selection, or can be done with the ZPL command `^SC`.

**Setting Up Communications** Insure that the Host computer and the Zebra printer are characterized with the same communication parameters; i.e., Parity, Baud Rate, etc. The communications must be set up for 8 data bits.

**Setting the Printer ID Number** The Protocol uses the printer's Network ID number to insure communication with the proper unit. The Network ID is programmed into the printer by sending the printer a `^NI` (Network ID Number) command or done through the front panel.

If there is only one printer connected to the Host computer, the Network ID number should be set to all zeros (default).

If there is more than one printer, such as in a broadcast or multi-drop environment, each printer should be assigned its own unique ID number. Printers in this environment, with an ID of all zeros, will receive ALL label formats regardless of the actual printer ID number in the DST. Z-ID block of the Request Packet.

## Error Conditions and System Faults

**Restarting a Transmission** If a break in communication occurs, the Host must restart the transmission of the current label format with an Initialization Request Packet. The Zebra printer will not respond to Request Packets sent out of sequence. However, the Zebra printer will respond to an Initialization Request Packet and restart its internal counting with the sequence number of the Request Packet.

**CRC Error Conditions and Responses** A CRC error condition can be detected when the printer receives a Request Packet or when the Host computer receives a Response Packet. The following list defines these errors and how the Host computer should respond to them.

Error	Response
The CRC calculated by the Zebra printer does not match the one received as part of the Request Packet.	The Zebra printer will return a Negative Acknowledgment Response Packet. The Host computer should retry the same Transaction with the same Sequence Number.
The CRC calculated by the Host computer does not match the one received as part of the Response Packet.	The Host computer should retry the same Transaction with the same Sequence Number.

## Time-Out Error Conditions and Responses

There are certain conditions at the Zebra printer that might cause the Host computer to time-out while processing a Transaction. The following list illustrates these conditions and how the Host computer should respond to them.

Error	Response
A Request Packet from the Host computer is not received by the Zebra printer.	The Host computer times out and resends the Request Packet of the same Transaction with the same Sequence Number.
A Request Packet from the Host computer is partially received by the Zebra printer.	The Host computer times out and resends the Request Packet of the same Transaction with the same Sequence Number.
A Response Packet from the Zebra printer is not received by the Host computer.	The Host computer times out and resends the Request Packet of the same Transaction with the same Sequence Number.
A Response Packet from the Zebra printer is partially received by the Host computer.	The Host computer times out and resends the Request Packet of the same Transaction with the same Sequence Number.

## How the Zebra Printer Processes a Request Packet

The following describes the steps taken at the Zebra printer to process a Request Packet.

1. The Zebra printer looks for a SOH (Start of Header) character. As soon as it finds one, it places the SOH and all the data after it into its Receive Data Buffer. This process continues until the printer receives an EOT (End of Transmission) character.

**Note •** If a second SOH is received before an EOT is detected, the contents of the Receive Buffer will be discarded. All of the data after the second SOH will be placed in the Receive Data Buffer.

2. After detecting the EOT, the printer checks for the following:  
\* The DST. Z-ID matches the printer's Network I.D.

**Note •** If the Network ID at the printer is all zeros, the printer will accept all Request Packets regardless of the DST. Z-ID received. If a Request Packet is received with the DST. Z-ID all zeros, it is accepted by all printers regardless of their Network ID setting.

\*The Data Format begins with STX and ends with ETX.

\*The Sequence Number has not been used before.

If the check is satisfactory, proceed to Step 3 on the following page.

If any part of the check is unsatisfactory, the printer discards the data in its Receive Data Buffer and waits for another SOH. No response is sent to the computer.

### Exceptions

It is possible that the printer will send a response to the host that the host does not receive. Therefore, the host will send the same request packet to the printer again. If this happens, the printer will not use the data if it already used it before. However, the printer will send a response back to the host.

The printer calculates the CRC and compares it with the one received in the Request Packet. If the CRC is valid, the printer sends a Positive Response Packet to the Host computer. It then transfers the 'Variable Length' data from the Receive Buffer to its memory for processing. If the CRC does not match, and the printer is set up to return a Negative Response Packet, the following will take place:

1. The printer assumes that the DST. Z-ID, SRC. Z-ID, and Sequence Number are correct and that the error was in the variable data.
2. The same DST. Z-ID, printers SRC. Z-ID, and Sequence Number will be returned back to the host in the Negative Response Packet.
3. If the assumption in (a) is incorrect, the Host computer can time-out and retransmit the original Request Packet.

## How the Zebra Printer Responds to Host Status

If a ~HS (Host Status) command is received by the Zebra printer, the printer will send back an acknowledgment for the receipt of the packet. It then sends an additional packet that includes the Host Status information in the Variable Length portion of the packet.

# ZB64 Encoding and Compression

This section describes the Base 64 MIME (ZB64) encoding and compression. This is the same type of MIME encoding that is used in e-mail.

For more information on ZB64 Encoding and Compression, contact your Reseller or Zebra Representative.

## Contents

Introduction to B64 and Z64 .....	1337
B64 and Z64 Encoding .....	1339

## Introduction to B64 and Z64

The first encoding, known as B64, encodes the data using the MIME Base64 scheme. Base64 is used to encode e-mail attachments and is specifically designed to address communications path limitations, such as control characters and 7-bit data links. It encodes the data using only the printable ASCII characters:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
a b c d e f g h i j k l m n o p q r s t u v w x y z  
0 1 2 3 4 5 6 7 8 9        + / =

With the use of ZPL, this has the added benefit of avoiding the caret (^) and tilde (~) characters. Base64 encodes six bits to the byte, for an expansion of 33 percent over the un-enclosed data. This is much better than the 100 percent expansion given by the existing ASCII hexadecimal encoding.

The second encoding, known as Z64, first compresses the data using the LZ77 algorithm to reduce its size. (This algorithm is used by the PKWARE® compression program PKZIP™ and is integral to the PNG graphics format.) The compressed data is then encoded using the MIME Base64 scheme as described above.

A CRC is calculated across the Base64-encoded data. If the CRC-check fails or the download is aborted, the object can be invalidated by the printer.

The robust encodings can be piggybacked on the existing download commands with full backward compatibility. This is done by prefacing the new encodings with a header that uniquely identifies them. The download routines in the printer firmware can key-off the header to determine whether the data is in the old ASCII hexadecimal encoding or one of the new encodings. This allows existing downloadable objects to be used in their present format, while new objects can be created using the same download commands with the new encodings for increased integrity and reduced download times.

For easy reference, B64 and Z64 are referred to as ZB64. In any reference to the ZB64 encoding, assume that both Base64-only (B64) and LZ77/Base64 (Z64) encodings are accepted.

**Example:** The following is an example of an existing download command using the new encoding:

```
~DTARIAL,59494,:Z64:H4sICMB8+DMAC0FSSUFML1RURgDsmand8VEW7x5+Z0edsyibZ
NNJhlyWhbEJlIwYSwJDGNkmwghJlglJYEEEhQIPSggKAjEAIIiVaSoIJYNBAkIGgGxUBVU
UCGU0JQSC0WFnPvbE+SF18+9H+8f973X+3Jm93umzzNznnvNSSFGRJ6ARAVZvXK7XDaX
LyTiR5B7ontuZPQ824I5RKIa6ew+aba8+pU1rVDZiciv
```

[multiple lines deleted]

```
/06DU5wZ7ie2+g4xzDPwCpwm3nqw2GAPcdclxF4fIP66jHjncmKvKzh/ZUNCx19/QQx2
HXHYB4m/PkQcdCdx2G70Yt+mszkMh4iZxoifvkh89BFipo87kwD/Bf/d0cycAAEA:a1b
2
```

The parameters are identical to the existing ~DT command:

Table 43 •

Parameter	Details
<b>o</b> = font name	<b>Values:</b> any valid TrueType name, up to 8 characters <b>Default:</b> if a name is not specified, UNKNOWN is used In this example, Arial is the specified font.
<b>s</b> = font size	<b>Values:</b> the number of memory bytes required to hold the Zebra-downloadable format of the font <b>Default:</b> if an incorrect value or no value is entered, the command is ignored In this example, 59494 is the size. To maintain compatibility with the existing ASCII hexadecimal encoding, this field must contain the size of the un-enclosed and uncompressed object — the number of bytes that are finally placed into the printer's memory, not the number of bytes downloaded.

Table 43 •

Parameter	Details
<b>data = data string</b>	<p><b>Values:</b> a string of ASCII hexadecimal values (two hexadecimal digits/byte). The total number of two-digit values must match parameter <b>s</b>.</p> <p><b>Default:</b> if no data is entered, the command is ignored</p> <p>Everything following the size field is data. The new encoding imposes a header with a unique signature. The new encoding must start with the characters :B64: (data encoded in Base-64 only) or :Z64: (data compressed with LZ77, then encoded in Base-64) followed by the encoded data.</p> <p>After the data is presented, another colon (:) and four hexadecimal digits comprise the CRC. The Base64 standard allows new-line characters (carriage returns and line feeds) to be inserted into the encoded data for clarity. These characters are ignored by the printer.</p>

When downloading graphics, the colon is used in the current ASCII hexadecimal encoding indicate “repeat the previous dot row.” Since this shorthand is invalid for the first character of data (no previous dot row has been downloaded), it is safe for the printer to detect the leading colon character as the lead-in for the new encodings.

## B64 and Z64 Encoding

These download encodings, B64 and Z64, are created as drop-in replacements for the existing ASCII hexadecimal encoding.

B64 encoding do the following:

- Encode the compressed data using the MIME Base64 algorithm.
- Calculate a CRC across the encoded data.
- Add a unique header to differentiate the new format from the existing ASCII hex encoding.

Z64 encoding do the following:

- Compress the data using the LZ77 algorithm.
- Encode the compressed data using the MIME Base64 algorithm.
- Calculate a CRC across the encoded data.
- Add a unique header to differentiate the new format from the existing ASCII hexadecimal encoding.

The data field have this format:

**:id:encoded\_data:crc**

**Table 44 •**

Parameter	Details
<b>:id</b>	the identifying string B64 or Z64
<b>:iencoded_data</b>	data to download, compressed with LZ77 (if the id parameter is set to Z64) and encoded with Base64.
<b>:crc</b>	four hexadecimal digits representing the CRC calculated over the :encoded_data field.

The printer calculates a CRC across the received data bytes and compare this to the CRC in the header. A CRC mismatch is treated as an aborted download.

The B64 and Z64 encodings can be used in place of the ASCII hexadecimal encoding in any download command. The commands are:

- ~DB** – Download Bitmap Font
- ~DE** – Download Encoding
- ~DG** – Download Graphic
- ~DL** – Download Unicode Bitmap Font
- ~DS** – Download Scalable Font
- ~DT** – Download TrueType Font
- ~DU** – Download Unbounded TrueType Font
- ^GF** – Graphic Field (with compression type set to “ASCII hex”)

The **~DB** (Download Bitmap Font) command can use the new encodings in place of the ASCII hexadecimal encoding in data sub-fields. Each character is encoded individually. However, for small amounts of data, the identifying B64 or Z64 header and trailing CRC may negate any gains made by using the new format.

For backward compatibility, the **^HG** (Host Graphic) command uses the ASCII hexadecimal encoding. It does not use the new encodings.

# Field Interactions

This section provides you with examples that show how commands interact with various justification parameters. The examples are in charts for these orientations:

Normal Orientation .....	1342
Rotated Orientation .....	1343
Bottom Up Orientation.....	1344
Inverted Orientation.....	1345

These charts are designed so that you can identify the location of the field origin and interactions between the rotation, formatting and justification commands.

## Normal Orientation

Table 45 shows you the various normal orientation outputs:

Table 45 • Normal Orientation Examples

	^FPH	^FPV	^FPR
^FO Left Justified	+ABCDE	A B C D E	EDCBA+
^FT Left Justified	-ABCDE	A B C D E	EDCBA-
^FO Right Justified	ABCDE+	A B C D E	EDCBA
^FT Right Justified	ABCDE-	A B C D E	EDCBA

## Rotated Orientation

Table 46 shows you the various rotated orientation outputs:

Table 46 • Rotated Orientation Examples

	^FPH	^FPV	^FPR
^FO Left Justified	+ABCDE	A B C D E	EDCBA
^FT Left Justified	+ABCDE	E D C B A	EDCBA
^FO Right Justified	+ABCDE	E D C B A	EDCBA
^FT Right Justified	ABCDE	A B C D E	EDCBA

## Bottom Up Orientation

Table 47 shows you the various bottom up orientation outputs:

Table 47 • Bottom Orientation Examples

	^FPH	^FPV	^FPR
^FO Left Justified	A B C D E	A B C D E	E D C B A
^FT Left Justified	A B C D E	A B C D E	E D C B A
^FO Right Justified	E D C B A	A B C D E	E D C B A
^FT Right Justified	E D C B A	A B C D E	E D C B A

## Inverted Orientation

Table 48 shows you the various inverted orientation outputs:

**Table 48 • Inverted Orientation Examples**

	^FPH	^AVP	^FPR
^FO Left Justified	ABCDE	+E D C B A	+A B C D E
^FT Left Justified	ABCDE	+E D C B A	+A B C D E
^FO Right Justified	ABCDE	+E D C B A	+A B C D E
^FT Right Justified	ABCDE	+E D C B A	+A B C D E

# Real Time Clock

This appendix contains the information needed to install, program, and operate the Real Time Clock (RTC) option. This hardware option is available as either a factory-installed or field-installable option in specific printer products manufactured and sold by Zebra Technologies Corporation.

The Real Time Clock option is currently available for following printers, and requires that the firmware version shown is installed on that printer.

## Contents

## Control Panel Programming

New parameters for the Real Time Clock have been added to the Control Panel Configuration. These parameters are located immediately following the **FORMAT CONVERT** prompt. Refer to the printer/print engine *User Guide* for complete configuration information.

- X.9.x firmware added the parameters to *Xill* printers and *170PAX/170PAX2* print engines.
- X.10.x firmware added the parameters to *Xilll* printers and *PAX3* print engines.
- X.13.x firmware added the parameters to *XilllPlus* printers, *PAX4* print engines.
- X.13.0.13Z firmware added the parameters to *105SL* printers.

## Real Time Clock Parameters

The parameters listed on the following pages are added to the Control Panel Configuration prompts only when both the Real Time Clock hardware option and the appropriate version of firmware are installed:

- X.9.x or later firmware installed in the *Xill* series printers or the *170PAX/170PAX2* series print engines.
- X.10.x or later firmware installed in the *Xilll* series printers or the *PAX3* series print engines.
- X.13.0.13Z or later firmware installed in the *105SL* printers
- X.13.x or later firmware installed in the *XilllPlus* series printers, the *PAX4* series print engines, or the *S4M* printers.

The RTC ZPL II commands apply to all printers/print engines with the Real Time Clock hardware option and proper firmware.

### Idle Display

Selects the printer/print engine Idle Display format and the method of displaying the time/date information. This parameter also affects the Configuration Label printout and the **RTC DATE** and **RTC TIME** formats.

#### Selections

- FW VERSION
- MM/DD/YY 24HR
- MM/DD/YY 12HR
- DD/MM/YY 24HR
- DD/MM/YY 12HR

If FW VERSION is selected, the format on the Configuration Label and on the RTC DATE and RTC TIME parameters is MM/DD/YY 24HR.

## RTC Date

Allows entry of the RTC date in the format selected by the **IDLE DISPLAY** parameter.

**Note** • The RTC parameters are password-protected. Refer to your printer's user guide for specific instructions on accessing and modifying printer parameters.

Printer Model	Action
PAX Series print engines, Xi Series printers, and 105SL printers	<ol style="list-style-type: none"><li>1. Use the <b>LEFT</b> oval key to select the position to be adjusted</li><li>2. Then, use the <b>RIGHT</b> oval key to select the correct value for that position.</li></ol>
Z4Mplus and Z6Mplus printers	<ol style="list-style-type: none"><li>1. Press <b>SELECT</b> to select the parameter.</li><li>2. Use the <b>MINUS (-)</b> key to select the position to be adjusted</li><li>3. Then, use the <b>PLUS (+)</b> key to select the correct value for that position.</li><li>4. Press <b>SELECT</b> to accept any changes and deselect the parameter.</li></ol>
S4M printer	<ol style="list-style-type: none"><li>1. Press <b>ENTER</b>. The printer displays the current RTC date.</li><li>2. Modify the values as follows:<ul style="list-style-type: none"><li>• Press the right arrow to move to the next digit position.</li><li>• To increase the value, press the up arrow.</li><li>• To decrease the value, press the down arrow.</li></ul></li><li>3. Press <b>ENTER</b> to accept the value shown.</li></ol>

**Note** • Invalid dates, such as 2/29/1999, may be entered, but will not be saved.

## RTC Time

Allows entry of the RTC time in the format selected by the **IDLE DISPLAY** parameter.

**Note** • The RTC parameters are password-protected. Refer to your printer's user guide for specific instructions on accessing and modifying printer parameters.

Printer Model	Action
PAX Series print engines, Xi Series printers, and 105SL printers	<ol style="list-style-type: none"><li>1. Use the <b>LEFT</b> oval key to select the position to be adjusted</li><li>2. Use the <b>RIGHT</b> oval key to select the correct value for that position.</li></ol>
Z4Mplus and Z6Mplus printers	<ol style="list-style-type: none"><li>1. Press <b>SELECT</b> to select the parameter.</li><li>2. Use the <b>MINUS (-)</b> key to select the position to be adjusted.</li><li>3. Use the <b>PLUS (+)</b> key to select the correct value for that position.</li><li>4. Press <b>SELECT</b> to accept any changes and deselect the parameter.</li></ol>

Printer Model	Action
S4M printer	<ol style="list-style-type: none"> <li>1. Press ENTER. The printer displays the current RTC date.</li> <li>2. Modify the values as follows:           <ul style="list-style-type: none"> <li>• Press the right arrow to move to the next digit position.</li> <li>• To increase the value, press the up arrow.</li> <li>• To decrease the value, press the down arrow.</li> </ul> </li> <li>3. Press ENTER to accept the value shown.</li> </ol>

## RTC General Information

The Real Time Clock commands are only applicable if the Real Time Clock option is installed in the printer. For those printers with an LCD control panel display, additional control panel configuration parameters are also included.

The ZPL II Field Clock **^FC** command is used to specify the clock-indicator character for the primary, secondary, and third clocks. This command must be included within each label field command string whenever the date or time clock values are required within the field. No date or time clock information can be printed in a label field unless this command is included. The **^FC** command can now be combined with the **^SN** command in V60.13.0.10 and later.

A clock-indicator can be any printable character except the ZPL II Format Prefix, Control Prefix, or Delimiter characters. The default value for the primary clock-indicator is the percent sign **%**. The secondary and third clock-indicators have no defaults and must be specified in order for that clock to be used.

The Field Data **^FD** command has been expanded to recognize the clock-indicators and associated command characters, and to replace them during the printing process with the corresponding time or date parameter. For example, if the primary clock-indicator is the percent sign **%**, then during printing, the character sequence **%H** in the **^FD** statement would be replaced by the 2-digit current hour.

**Note** • If the Real Time Clock is not installed, or the **^FC** command has not preceded the **^FD** statement, no replacement would occur. In this case, the characters **%H** would print as text on the label.

The name of the day of the week, the name of the month, and the AM or PM designation can also be inserted in place of a specific clock-indicator/command character sequence. See [Table 49](#) for the list of command characters and their functions.

**Table 49 • Command Characters**

Command Character	Function
<b>%a</b>	is replaced by the abbreviated weekday name
<b>%A</b>	is replaced by the weekday name
<b>%b</b>	is replaced by the abbreviated month name
<b>%B</b>	is replaced by the month name

Table 49 • Command Characters

Command Character	Function
%d	is replaced by the day of the month number, 01 to 31
%H	is replaced by the hour of the day (military), 00 to 23
%I	is replaced by the hour of the day (civilian), 01 to 12
%j	is replaced by the day of the year, 001 to 366
%m	is replaced by the month number, 01 to 12
%M	is replaced by the minute, 00 to 59
%p	is replaced by the AM or PM designation
%S	is replaced by the seconds, 00 to 59
%U	is replaced by the week# of the year, 00 to 53, Sunday is 1st day*
%W	is replaced by the week# of the year, 00 to 53, Monday is 1st day**
%w	is replaced by the day# of the week, 00 (Sunday) to 06 (Saturday)
%y	is replaced by the 2 digits of the year, 00 to 99
%Y	is replaced by the full 4 digit year number—where% is the specified clock-indicator character

\*. %U establishes Sunday as the first day of the year.

\*\*.%W establishes Monday as the first day of the year.

The Set Offset **^SO** command permits the printing of specific times and dates relative to the primary clock. The secondary (or third) clock is enabled when secondary (or third) offsets are entered using this command. The secondary (or third) clock time and date are determined by adding the offsets to the current clock reading.

One **^SO** command is required to set the secondary offset; an additional **^SO** command is required for a third offset. The offsets remain until changed or until the printer is either powered down or reset.

**Note** • Only dates from January 1, 1998 to December 31, 2097 are supported. Setting the offsets to values that result in dates outside this range is not recommended and may have unexpected results.

The Set Mode/Language (see **^SL** on page 335) command is used to select the language the days of the week and the months are printed in. This command also sets the printing mode, which can be **S** for START TIME, **T** for TIME NOW, or a Numeric Value for the time accuracy. In START TIME mode, the time printed on the label is the time that is read from the Real Time Clock when the label formatting begins (when the **^XA** command is received by the printer). In TIME NOW mode, the time printed on the label is the time that is read from the Real Time Clock when the label is placed in the queue to be printed. In Numeric Value mode, a time accuracy tolerance can be specified.

## First Day of the Week Affects Calendar Week

The **%U** and **%W** commands set the first day of the week. The week numbering starts at the beginning of the year with Week 01 representing the **first full week** of the year. Any day(s) before that established first day of the week are part of the Week 00. The following examples show how setting different days as the first day of the week affect the calendar week.

**Important** • The **%U** and **%W** commands determine the numbering for all weeks in the year.

### Example: January, 2005 with Week 00

Set Sunday as the first day of the week using the **%U** command. In this example, notice that Saturday, January 1st is Week 00 and Sunday, January 2nd begins Week 01.

Sun	Mon	Tue	Wed	Thu	Fri	Sat
						1
2	3	4	5	6	7	8
9	10	11	12	13	14	15
16	17	18	19	20	21	22
23	24	25	26	27	28	29
30	31					

First Day of the Week →

Week 00 ←

Week 01 ←

### Example: January, 2005 with Week 00

Set Monday as the first day of the week using the **%W** command. In this example, notice that Saturday, January 1st and Sunday, January 2nd are Week 00 and Monday, January 3rd begins Week 01.

Mon	Tue	Wed	Thu	Fri	Sat	Sun
					1	2
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30
31						

First Day of the Week →

Week 00 ←

Week 01 ←

→ Example: January, 2006 without Week 00

Set Sunday as the first day of the week using the **%U** command. Since 2006 begins on a Sunday, there is no Week 00 in this example.

First Day of the Week

No Week 00

Week 01

Sun	Mon	Tue	Wed	Thu	Fri	Sat
No Week 00						
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	31				

→ Example: January, 2006 with Week 00

Set Monday as the first day of the week using the **%W** command. In this example, Saturday, January 1st is Week 00 and Sunday, January 2nd begins Week 01.

First Day of the Week

Week 00

Week 01

						1
2	3	4	5	6	7	8
9	10	11	12	13	14	15
16	17	18	19	20	21	22
23	24	25	26	27	28	29
30	31					

## Time and Date Precision

As of V60.13.0.1 firmware, the **^CO** command is now ignored. While the S4M printer has a lower firmware version number (V50.x), its firmware was recently released and follows the rule to ignore the **^CO** command.

The time and date placed in a label field is determined at the time the label bitmap is created by the printer (start time mode). If a batch of labels is formatted, the date and time will be the same for all labels in the batch. If the printer is paused during the printing process and remains in that state for a period of time, when printing resumes, the time and date will still be the same as when the batch was first started.

If more precise time and date stamps are required on versions prior to V60, follow the process below. For versions after V60, use the Numeric Value mode as shown in [^SL on page 335](#).

Cycle the printer/print engine power Off (O) and On (I) to clear the memory before performing the steps below.

1. Print a Memory Usage Label (**^XA^WD\* : \* . \*^XZ**) and note the following value:  
Available RAM (in BYTES) (A) \_\_\_\_\_
2. Print a Configuration Label and note these values:  
Printer "Print Width" (in DOTS) (B) \_\_\_\_\_  
(NOT the Label Width)  
Label Length (in DOTS) (C) \_\_\_\_\_
3. Determine the desired maximum number of queued labels with the (D) \_\_\_\_\_ same Time and Date value.

**Note** • Increasing the number of queued labels will improve throughput performance, but Real Time Clock values will be less accurate. Two is usually a good compromise.

4. Substitute the values for B through D from the previous page into the following formula:  
The "label queue" memory required (in BYTES) (E) \_\_\_\_\_  
 $(B \times C \times D)/8 =$
5. Substitute the values for A and E into the following formula:  
The **^CO** command memory required (in KBYTES) (F) \_\_\_\_\_  
 $(A-E)/1024)-5=$

**Note** • If the value of (F) is less than zero, then no **^CO** command is needed. If the value of (F) is greater than zero, use the integer portion in the **^CO** command.

#### Example:

Available RAM (A)	= 71478 BYTES
Print Width (B)	= 832 DOTS
Label Length (C)	= 1000 DOTS
Max Labels Queued (D)	= 2

Then —

The label queue memory required (E) =

$(B \times C \times D)/8 = 208000$  BYTES

And —

The **^CO** command memory required (F) =

$(71478-208000)/1024)-5=489.87$  KBYTES

Therefore, the correct **^CO** command string to add to the label format would be:

**^XA^COY,489^XZ**

This command string will cause 489 KBYTES to be set aside as Font Memory and make it unavailable as label format memory. The memory remaining will only allow two labels to be formatted at one time, and the time and date will be more precise for those two labels.

**Note** • For the 170PAX2 print engine, you must disable the Reprint Function for the Time Now Mode to function properly.

## ZPL II Samples

The ZPL II scripts shown on this page establish the initial settings for the date and time clock. The script below then references these settings to provide the output shown in [Figure 7 on page 1357](#).

Setting the date and time for the Real Time Clock only needs to be done once. The date and time are maintained by an on-board battery when the printer is reset or the printer is turned Off (O).

To set the date and time to April 23, 2005 at 2:30pm, the following command string should be sent to the printer:

```
^XA  
  ^ST04,23,2005,02,30,0,P^FS  
^XZ
```

To initialize the Real Time Clock and set up two offset values (offset #2 set to 3 months and 1 hour in the future, offset #3 set to 1 year in the past), the following command sequence should be sent to the printer:

```
^XA  
  ^SL  
  ^S02,3,0,0,1,0,0^FS  
  ^S03,0,0,-1,0,0,0^FS  
^XZ
```

The above ZPL II scripts initialize the RTC date and time and must be sent to a printer to provide proper date and time parameters for the ZPL II script below.

The following ZPL II script illustrates the various methods of printing the date and time initialized in the script above within separate fields on continuous media. [Figure 7 on page 1357](#) illustrates the printout of this script on a label.

For the below example, the **^FC** command delimiters are:

```
% Primary clock indicator
{ Secondary clock indicator
# Third clock indicator

^XA
^LL175
^FO10,025^AD^FC%,{,#^FD1: Mil: %H:%M:%S Civ: %I:%M:%S %p^FS
^FO10,050^AD^FC%,{,#^FD2: Mil: {H:{M:{S Civ: {I:{M:{S {p^FS
^FO10,075^AD^FC%,{,#^FD3: Mil: #H:#M:#S Civ: #I:#M:#S #p^FS
^FO10,100^AD^FC%,{,#^FD1: On %A, %B %d
, %Y (%a, %m/%d/%y, %d %b %Y).^FS
^FO10,125^AD^FC%,{,#^FD2: On {A, {B {d, {Y (
{a, {m/{d/{y, {d {b {Y).^FS
^FO10,150^AD^FC%,{,#^FD3: On #A, #B #d, #Y (
#a, #m/#d/#y, #d #b #Y).^FS

^XZ
```

**Figure 7 • Printed Result of the Above ZPL II Script**

- 1: Mil: 14:30:00 Civ: 02:30:00 PM
- 2: Mil: 15:30:00 Civ: 03:30:00 PM
- 3: Mil: 14:30:00 Civ: 02:30:00 PM
- 1: On Wed, April 23, 2005 (Fri, 04/23/05, 23 Apr 2005)
- 2: On Saturday, July 23, 2005 (Sat, 07/23/05, 23 Jul 2005)
- 3: On Friday, April 23, 2004 (Fri, 04/23/04, 23 Apr 2004)

The following are examples of the time stamp using the **^SL1** and **^SL5** at 2 ips and 10 ips for the Enhanced Real Time Clock (V60.13.0.10 and later).

**Note** • They show the variation of time due to print speed and label complexity.

```
^XA
^SL1^FS
^FO187,184^A0N,101,121^FC%^FD%H:%M:%S^FS
^PQ10
^XZ
```

# ZBI Character Set

This section provides you with the set of characters that are supported on the front panel of the following Zebra printers with ZBI 2.0: *XIIIIPPlus*, 105SL, Z4M/Z6M, ZM400/ZM600, RZ400/RZ600, PAX4 and S4M when V60.16.0Z or V53.16.0Z, or later firmware are loaded. These characters can be used in ZBI programs to display content on the LCD.

## Character Set

These are the supported characters for these Zebra printers:

- *XIIIIPPlus*
- 105SL
- Z4M/Z6M
- PAX4
- S4M:

Char. code	0 0 0 0 0 0 1 1 1 1 1 1	0 0 0 1 1 1 1 0 0 1 1 1 1	0 1 1 0 0 1 1 1 1 0 0 1 1	0 0 1 0 1 0 1 0 1 0 1 0 1

# SGD Command Support

This appendix provides you with details identifying which SGD commands can be used with different printers and firmware versions.

## Printer and Firmware Compatibility

This section provides supported printer models and minimum firmware versions for all SGD commands. In order to set and get configurations, the SGD commands can be used through the Ethernet, serial, parallel, and USB interfaces.

**Note** • The printer responds with the printer setting of "?" if the printer setting:

- does not exist
- has not been configured yet

If you have ...	Then...
<ul style="list-style-type: none"><li>• 105SL</li><li>• PAX4</li><li>• S4M</li><li>• Xi4</li><li>• <i>XilllPlus</i></li></ul>	<ul style="list-style-type: none"><li>• Z4MPlus/Z6MPlus</li><li>• ZM400/ZM600</li><li>• ZT200 Series</li><li>• ZE500 Series</li></ul> <p>Go to <a href="#">Table 50, Table Top and Print Engine SGD Firmware Compatibility</a> on page 1366.</p>
<ul style="list-style-type: none"><li>• ZD500R</li><li>• HC100</li><li>• KR403</li><li>• LP2824 Plus</li><li>• TLP2824 Plus</li></ul>	<ul style="list-style-type: none"><li>• G-Series</li><li>• GT800</li><li>• GC420d</li><li>• GC420t</li><li>• GK800</li><li>• GK888</li></ul> <p>Go to <a href="#">Table 51, Desktop and Kiosk SGD Firmware Compatibility</a> on page 1378.</p>
<ul style="list-style-type: none"><li>• R110PAX4</li><li>• R110Xi (UHF)</li><li>• R110Xi HF</li><li>• R170Xi</li></ul>	<ul style="list-style-type: none"><li>• R4Mplus</li><li>• RXi4</li><li>• RZ400/RZ600</li></ul> <p>Go to <a href="#">Table 52, RFID Printer SGD Firmware Compatibility</a> on page 1399.</p>

## Standard Table Top Printers and Print Engines

**Important** • All the firmware versions noted in [Table 50](#) refer to the minimum firmware version required. For Desktop and Kiosk printers see [Table 51](#). For RFID printer support, see [Table 52](#).

**Table 50 • Table Top and Print Engine SGD Firmware Compatibility**

## RFID Printers

**Important** • All the firmware versions noted in [Table 52](#), refer to minimum firmware version required. For non-RFID Table Top printers and Print Engines, see [Table 50](#). For non-RFID Desktop printers, see [Table 51](#).

Once an RFID Ready printer has been reconfigured as a RFID Printer, [Table 52](#) should be used.

For commands not listed in [Table 52](#), refer to [Table 50](#) and [Table 51](#) and compare your firmware version to the Vxx.xx.xx firmware to which it most closely corresponds.

# Firmware Features

This appendix covers features added to major firmware releases.

## Firmware x.17

Identifies features that are available in printers with firmware version Vx.17.x or later.

The following is an overview of the new and enhanced features available in firmware version V53.17.x, V56.17.xZ, V60.17.x, V61.17.xZ, and later.

### Mirror

Mirror is a feature that gives you the ability to:

- Centrally manage and monitor the deployment of your Zebra printers
- Centrally configure and maintain your Zebra printers through remote updates
- Remotely monitor printer updates – via the “Feedback” feature
- There are several Set/Get/Do (SGD) commands that can initiate Mirror. For details see *Mirror Printer Configuration* [on page 1425](#).

### Benefits

- When using Mirror, updating the configuration and firmware on the printer is remotely managed from a centralized FTP server. Configurations can be uniformly deployed to individual printers or to groups of printers. Unique configurations can also be targeted to printers as needed. Through the “Feedback” feature, Administrators can easily log and monitor configuration updates on a printer-by-printer basis. Typical uses of Mirror include:
- Configuring printers as they are first received.
- Performing scheduled maintenance updates, sending firmware, fonts, graphics and other objects to the printer as needed.
- Changing printer configurations in order to move printers from one role to another.

- Supported printers and print servers:

Printer	Print Servers
Xi4™ -series	<ul style="list-style-type: none"><li>• Internal, Integrated 10/100 IPV4 wired</li><li>• Internal Wireless Plus</li></ul>
ZM400™	<ul style="list-style-type: none"><li>• Internal, Integrated 10/100 IPV4 wired</li><li>• Internal Wireless Plus</li></ul>
ZM600™	<ul style="list-style-type: none"><li>• Internal, Integrated 10/100 IPV4 wired</li><li>• Internal Wireless Plus</li></ul>
S4M™	<ul style="list-style-type: none"><li>• Internal Wireless Plus</li></ul>

Print Servers connected to the parallel port, either externally or internally, are not supported for Mirror use.

## Wireless Markup Language (WML)

WML offers a text-based method of designing customized menus on the LCD front panel of selected printers. By leveraging Set-Get-Do (SGD) and Zebra Programming Language (ZPL) commands, menus that feature both display and command features can be created. The WML “card” structure makes it possible to link from one menu screen to another, creating menus that are as many levels “deep” as desired or reduced to only those options needed by the printer operator.

## Firmware x.16

.16t

Identifies features that are available in printers with firmware version V60.16.x, V53.16.x, or later.

The following is an overview of the new and enhanced features available in firmware version V53.16.x and V60.16.x, and later; it is ZBI 2.0-Ready. These include:

- ZBI 2.0 can be enabled by placing a ZBI 2.0 key on the printer via the ZBI Key Manager & Downloader utility. Printers can be ordered from the factory with the ZBI 2.0 option enabled. Printers can be ZBI-Enabled in the field by purchasing and using a ZBI Key Kit. Printers can be ZBI-Enabled in the field by purchasing a key at [www.zebrasoftware.com](http://www.zebrasoftware.com).
- Printers which have been ZBI-Enabled will not display a “Z” at the end of the firmware version string. For example, a printer which has been ZBI-Enabled will display the firmware version as “V53.16.1”, while a printer which has not been ZBI-Enabled will display the firmware version as “V53.16.1Z”
- The printer configuration label will display the ZBI status for the printer:
  - ZBI-Enabled

ENABLED.....	ZBI
2.0.....	ZBI VERSION
READY.....	ZBI STATUS

- Not ZBI-Enabled

DISABLED.....	ZBI
2.0.....	ZBI VERSION

- The printer configuration label will list which ZBI program is running.

ENABLED.....	ZBI
2.0.....	ZBI VERSION
CHOICES.BAS.....	ZBI STATUS

- ZBI 2.0 is backwards compatible with previous versions of ZBI. Any code which was specifically written to handle a maximum string length of 255 characters will need to be reviewed to ensure it works with unlimited string lengths.
- Other ZBI 2.0 Features:
  - List ZBI programs from the front panel
  - Start/Stop ZBI programs from the front panel
  - Button presses on front panel can be registered as events in ZBI programs.
  - Applicator port control
  - Support for longer strings, the length of the string dependent on available memory.
  - Support for NULL values in Strings and String operations
  - SNMP & Set/Get/Do (SGD) Control of ZBI
  - On-printer Debugging (via ZBI-Developer)
  - ZBI 2.0 Program Encryption
  - ZBI 2.0 programs can be made hidden and/or persistent
- New ZBI 2.0 Commands:

ACCEPT	INTTOHEX\$
ADDBREAK	READ
AUXPORT_GETPIN	REGISTEREVENTS
AUXPORT_RELEASEPIN	SERVERSOCKET
AUXPORT_SETPIN	SPLIT
AUXPORT_STEALPIN	SPLITCOUNT
CLIENTSOCKET	SUB
CLOSE ALL	TCPX
DELBREAK	TRIGGEREVENT
HANDLEEVENT	UNREGISTEREVENTS
HEXToint	WRITE

## Firmware x.15

.15↑

Identifies features that are available in printers with firmware version V60.15.x, V50.15.x, or later.

The following is an overview of the new and enhanced features available in firmware version V60.15.x, V50.15.x, or later. These include:

- Additional wireless securities
- New and updated ZPL commands (including wireless commands)
- Extended SNMP features, providing SNMP based control over commonly-needed printer settings.
- Support for Set / Get / Do (SGD) commands

### Wireless Securities

Firmware V60.15.x and V50.15.x offer support for a wider range of wireless securities. These are the supported wireless securities:

- WEP-40-BIT
- WEP-128-BIT
- EAP-TLS
- EAP-TTLS
- EAP-FAST
- PEAP
- LEAP
- WPA-PSK
- WPA EAP-TLS
- WPA EAP-TTLS
- WPA EAP-FAST
- WPA PEAP
- WPA LEAP
- KERBEROS\*

\* Use of any given wireless security is dependent on the RF card being used.

## ZPL and SGD Commands

**Table 53** identifies the new commands and updates to existing commands in firmware version V60.15.x, V50.15.x, or later. The bolded items are either new commands or new enhancements to existing commands.

**Table 53 • x.15 Features in Detail**

Command	Details
<b>^KC</b>	The <b>^KC</b> command is a new command with firmware version V60.15.x, V50.15.x, or later. It allows wireless print servers to have their own client identifier (CID). When the print server is active it uses the CID on the printer. When both print servers are active they have the option to use the CID on the printer, or their own CID.
<b>~DY</b>	Firmware version V60.15.x, V50.15.x, or later supports <b>.NRD</b> (non readable file) files and <b>.PAC</b> files (protected access credential).
<b>~WS</b>	Firmware version V60.15.x, V50.15.x, or later added these new parameters: <ul style="list-style-type: none"> <li>• wireless pulse—adds a pulse to the network traffic generated by the printer. To keep the printer online, a pulse is necessary with some network configurations.</li> <li>• wireless pulse interval—when the wireless pulse feature is enabled this sets the interval at which the wireless pulse is sent.</li> <li>• channel mask—for commonly used channel masks.</li> <li>• international mode—disables or enables International mode</li> </ul>
<b>^WX</b>	The <b>^WX</b> command configures the wireless security settings for printers using the wireless print server.

## SNMP

Firmware V60.15.x, V50.15.x, or later feature support for an extended Management Information Base (MIB) file. The extended support now covers many of the printer settings, such as darkness, media type, and other printer specific settings. The MIB file can be downloaded from [www.zebra.com](http://www.zebra.com) for use with SNMP management systems.

## Set / Get / Do Support

Printers with firmware V60.15.x and V50.15.x support a new set of commands known as Set / Get / Do (SGD) commands. These commands allow you to configure and get status on the wireless settings in the printer. For details on the supported commands, see *SGD Printer Commands* [on page 609](#).

## XML-Enabled Printing

Printers with firmware V60.15.8Z, V53.15.8Z, or later support XML-Enabled printing. For details, go to <http://www.zebra.com/xml>. This new feature does not alter the ZPL capabilities of the printer.

## Firmware x.14

.14↑

Identifies features that are available in printers with firmware version V60.14.x, V50.14.x, or later.

**Table 54** identifies the new commands and enhancements to existing commands in firmware V60.14.x, V50.14.x, or later. The bolded items are either new commands or new enhancements to existing commands.

**Table 54 • x.14 Features in Detail**

Command	Details
<b>^CI</b>	<p>The <b>^CI</b> command selects the encoding and character set. To identify the encoding, include a <b>^CI</b> in the ZPL script. These encodings are now supported with the <b>^CI</b> command:</p> <p>These are new variables that were added to the desired character set or a parameter of the existing <b>^CI</b> command:</p> <ul style="list-style-type: none"> <li><b>Big 5 HKSCS (^CI26) with BIGHK.DAT.</b> This supports the Hong Kong supplementary character set of the Big 5 character set and encoding. You can download the Big 5 HKSCS DAT table from <a href="http://www.zebra.com">www.zebra.com</a>.</li> <li><b>Code Page 1252 (^CI27).</b> The <b>^CI27</b> command supports code page 1252.</li> <li><b>GB 18030 (^CI26) with GB18030.DAT.</b> This supports the GB 18030 character set and encoding standard.</li> <li><b>Unicode Support.</b> These new values were added to the <b>^CI</b> command:           <ul style="list-style-type: none"> <li><b>28</b> = Unicode (UTF-8 encoding)</li> <li><b>29</b> = Unicode (UTF-16 Big-Endian encoding)</li> <li><b>30</b> = Unicode (UTF-16 Little-Endian encoding)</li> </ul> </li> </ul>
<b>~DY</b>	The <b>~DY</b> command downloads fonts to the printer. Firmware version V60.14.x, V50.14.x, or later improves support for TrueType fonts and adds support for TrueType Extension fonts. When OpenType fonts can be downloaded as a TrueType font they are supported.
<b>^FH</b>	The <b>^FH</b> command allows you to enter the hexadecimal value for any character directly into the <b>^FD</b> statement. It has been updated to function with Unicode encodings.
<b>^FL</b>	The <b>^FL</b> command provides the ability to link any TrueType font, including private character fonts to associated fonts, such that if the base font does not have a glyph for the required character, the printer looks to the linked fonts for the glyph. The font links are user-definable.
<b>^FO, ^FT, ^FW</b>	In firmware version earlier than V60.15.x, V50.15.x or later, the <b>^FO</b> and <b>^FT</b> commands were left-justified. In firmware version V60.14.x, V50.14.x, or later, a new parameter supports right- and auto-justification. Using the <b>^FW</b> command allows you to set justification options.
<b>^HT</b>	Over a communication port, the <b>^HT</b> command receives the complete list of the font links.

**Table 54 • x.14 Features in Detail**

<b>Command</b>	<b>Details</b>
<b>^LF</b>	The <b>^LF</b> command prints out a list of the linked fonts.
<b>^PA</b>	The Advanced Text Layout Options command ( <b>^PA</b> ) is new in firmware version V60.14.x, V50.14.x, or later. Advanced text layout, such as bidirectional text layout, character shaping, and OpenType support, can be activated with the <b>^PA</b> command. The glyph displayed when the character is missing from a font (default glyph) can be changed from a space character to the default glyph of a font, which is often a square box.
<b>^SL</b>	A new parameter was added to the <b>^SL</b> command to support the Japanese language in the Real Time Clock feature set.
<b>^TB</b>	The text block ( <b>^TB</b> ) command is a new command in firmware version V60.14.x, V50.14.x, or later. The <b>^FB</b> command allows you to print text into a defined block type format; it does not support complex text layout. In contrast, the <b>^TB</b> command supports a text block with complex text.

## Global Printing Solution

The Global Printing solution greatly simplifies international character label printing by supporting Unicode compatible fonts and encoding (UTF-8, UTF-16BE and UTF-16LE) directly in its printers.

These are new and enhanced features available in firmware version V60.14.x, v50.14.x, or later:

- Advanced text layout options
- Big 5 HKSCS
- GB 18030
- Unicode support (UTF-8 and UTF-16)
- Code Page 1252
- Field hexadecimal
- Field origin justification
- Font linking
- Improved font support
- Real-time clock – Japanese support
- Text block

For details on these new features, see [Table 53 on page 1411](#).

Zebra firmware V60.14.x, V50.14.x, or later continues to support locale-specific encoding formats. These formats include:

- Code Page 850
- Shift JIS

- GB
- Unified Hangul Code
- Big 5

## What Is Unicode?

Unicode is a universal code page (which converts numeric codes into characters) that can be used with many computer platforms and software applications. While ASCII and other traditional code page encoding systems support 256 characters or less, Unicode can support almost 100,000 characters for all major languages. The languages include complex non-Western languages that can be difficult to print.

Unicode encoding and supporting fonts allow the printer to seamlessly output in any language. As a result, you do not have to select the language, font, code page, or configure or adjust the printer. Zebra's printer-resident capabilities provide fast label output and seamless multi-language printing.

You can create private libraries of logos and special characters and include them in labels. The ability to create custom characters is valuable for creating shipping labels for Asia, as many Asian fonts don't support characters for names, street names, and other proper nouns. Firmware V60.14.x, V50.14.x, or later offers features that support bidirectional printing or complex text layout, including:

- Arabic
- Hindi
- Thai
- Vietnamese
- Other languages

# Mirror

This section provides an overview of Mirror, details on how to use it, and configuration examples.

## Mirror Overview

Mirror is a feature that gives you the ability to:

- Centrally manage and monitor the deployment of your Zebra printers
- Centrally configure and maintain your Zebra printers through remote updates
- Remotely monitor printer updates - via the "Feedback" feature

There are several Set/Get/Do (SGD) commands that are used to configure and initiate Mirror. For details see, [Mirror Printer Configuration on page 1425](#).

## Benefits

When using Mirror, updating the configuration and firmware on the printer is remotely managed from a centralized FTP server. Configurations can be uniformly deployed to individual printers or to groups of printers. Unique Configurations can also be targeted to printers as needed.

Through the "Feedback" feature, Administrators can easily log and monitor configuration updates on a printer-by-printer basis.

Typical uses of Mirror include:

- configuring printers as they are first received
- performing scheduled maintenance updates, sending firmware, fonts, graphics and other objects to the printer as needed
- changing printer Configurations in order to move printers from one role to another

[Figure 10](#) provides an illustration of Mirroring.

Figure 10 • Mirror Illustration

<b>1</b>	<b>Workstation</b> — sends SGD commands to the printer to configure it for Mirror use.
<b>2</b>	<b>FTP Server</b> — Stores configuration files and responds to Mirror requests from the printer. Receives and stores “Feedback” content.
<b>3</b>	<b>Access Point</b> — wireless network infrastructure
<b>4</b>	<b>Hub</b> — wired network infrastructure
<b>5</b>	<b>Zebra Printer(s)</b> — Configured using SGD commands. Sends Mirror requests to the FTP server to receive files. Transmits “Feedback” content to the FTP server to log Mirror event transactions and resulting printer settings.

## Professional Services for Mirror Configuration

Zebra offers a Professional Services group that can help with the configuring the Mirror feature. To inquire about Zebra's Professional Services, contact your Zebra account representative.

## Requirements

These are the requirements for Mirror:

- Zebra printer loaded with Mirror capable firmware and Print Server. For details, see [Table 55, Printers and Print Servers that Support Mirror](#) on page 1418.
- FTP server (with UNIX-style directory listings), configured with the following directories:
  - "<update-root>"/appl - This directory is used for printer firmware updates. During an update operation, the printer will first check the "<update-root>/appl" directory for new printer firmware

- "<update-root>"/files - This directory is used for printer-resident files. Files in this directory will be stored locally on the printer's file system. Files are not processed by the printer; they are only stored.
- "<update-root>"/commands - This directory is used for a limited number of printer executable commands. The contents of files in this directory will be sent to the printer's command interpreter for execution.
- "<feedback-root>" - This optional directory is used to receive Mirror feedback content from the printer. The content sent to this directory is defined by the "feedback.get" template file stored on the printer.
- A client account (user name and password) on the FTP server for the printer to use.
- A Terminal Emulation program, used to send SGD commands to the printer to configure Mirror.

## Supported Printers and Print Server Types

These are the Zebra printers, firmware versions, and Zebra print servers that support Mirror.

**Table 55 • Printers and Print Servers that Support Mirror**

Printer	Firmware	Print Servers
ZT400	V75.19.7Z (or later)	<ul style="list-style-type: none"> <li>• ZebraNet a/b/g/n Print Server</li> <li>• Internal Wireless Plus</li> <li>• Wireless Plus</li> </ul>

**Note** • Print Servers connected to the parallel port, either externally or internally, are not supported for Mirror use.

## How Mirror Works

Mirror utilizes a network connection and FTP communications to perform remote updates and feedback operations. At printer startup and/or at regular intervals, the printer will establish a FTP connection back to a central FTP server and check for updates. During an update operation, the printer will check for updated files in specific directories at the FTP server.

These are the specific FTP server directories that will be checked:

- "<update-root>"/appl - This directory is used for printer firmware updates. During an update operation, the printer will first check the "<update-root>/appl" directory for new printer firmware
- "<update-root>"/files - This directory is used for printer-resident files. Files in this directory will be stored locally on the printer's file system. Files are not processed by the printer; they are only stored.
- "<update-root>"/commands - This directory is used for a limited number of printer executable commands. The contents of files in this directory will be sent to the printer's command interpreter for execution.
- "<feedback-root>" - This optional directory is used to receive Mirror feedback content from the printer. The content sent to this directory is defined by the "feedback.get" template file stored on the printer.

**Note** • "<update-root>" refers to the value of the "ip.mirror.path" configuration parameter.

Files in the <update-root>/files directory should not have download headers in them. They should be in the exact format they will be in when stored on the printer's file system. Examples of download headers are: ~DY, ~DG, ! CISDFCRC16 or ~DF.

**Important** • When the printer is in the Mirror process:

- It is unavailable for other tasks.
- The LCD will indicate that it is performing a Mirror function, showing when the printer is downloading firmware and the names of the object files as they are transferred to the printer.

## Mirror Process Summary

The Mirror process follows a specific series of steps:

1. After power-up, the printer will first check the `<update-root>/app1` directory on the FTP server for new printer firmware and update the printer if necessary
2. If the printer did not find new firmware to download, it will then check in the `<update-root>\files` and `<update-root>/commands` directories for updated files - and download them as needed.
3. As a final Mirror step, the printer can perform an optional Feedback operation, transmitting a file of user-defined printer configuration information to `<feedback-root>` directory on the FTP server.
4. Finally, if any files or commands were downloaded during **Step 2:**, the printer will automatically reset itself.

## Mirror Process Details

The following items are important to be aware of when configuring the FTP server to support Firmware updated via Mirror.

- Firmware files must be named using the following format:  
`<firmware version>.zpl`, where `<firmware version>` is the exact Firmware revision contained in the file. For example, for Firmware version "V53.17.5Z", the filename stored on the FTP server must be "V53.17.5Z.ZPL". If the file name and Firmware version do not match, the update will not succeed.
- The firmware filename stored on the FTP server is not case sensitive. This means that "V53.17.5Z.ZPL" and "v53.17.5Z.zpl" will be processed in the exact same way.
- The `/app1` directory can contain only one (1) file at a time. If there is more than 1 file in this directory, the printer will not download anything and will skip the firmware update.

During a Mirror event, the printer will use `<firmware version>` part of the filename contained in the `/app1` directory on the FTP server to check if the Firmware stored on the FTP server is different than the firmware the printer is currently using. If the `<firmware version>` part of the Firmware file name in the `/app1` directory on the FTP server does not exactly match the printer's Firmware version, the file on the FTP server will be downloaded and used to update the printer. Once the printer is updated with the new Firmware, the printer will reset and begin using the new Firmware.

**Note** • Performing the Firmware update first is important because it is possible that the files or commands to be downloaded via Mirror will be dependent on the new firmware.

After the printer has completed the Firmware portion of an update operation, it will check the "<update-root>/files" directory and "<update-root>/commands" directory (in that order) for updated files that need to be retrieved. If a file exists on the FTP server and the server timestamp for the file does not match the printer's archived timestamp for the file, the printer will re-download the file and update its timestamp info. Files that are on the Mirror FTP server but not currently present on the printer will be sent to the printer. The supported file types are the standard files supported on ZPL printers.

If any files are downloaded during this portion of an update operation, the printer will reboot after the file downloads have completed. At this point, the update operation is complete.

**Important •**

- Files in the <update-root>/files directory should not have download headers in them. They should be in the exact format they will be in when stored on the printer's file system. Examples of download headers are: ~DY, ~DG, ! CISDFCRC16 or ~DF.
- ZPL files in the <update-root>/files directory must use the printers internal characters for the Format Command Prefix (^), Delimiter Character (,) and Control Command Character (~). This means that the caret (^) should be replaced with a HEX 1E, the comma (,) should be replaced with a HEX 1F and the tilde (~) should be replaced with a HEX 10.

After an update operation is complete, a printer will perform a feedback operation, if configured to do so. During a feedback operation, the printer will open its feedback template file (named **feedback.get**), populate it based on its contents, and upload the resulting contents file to the FTP server, in the "<feedback-root>" directory.

**Note •** "<feedback-root>" refers to the value of the "ip.mirror.feedback.path" configuration parameter

## Creating ZPL Files for Use in the "<update-root>/files" Directory

When creating ZPL formats that will be stored in the "<update-root>/files" directory it is necessary to edit the files using the following guidelines:

1. Files must contain only one format. This means that if a file contains multiple ^XA and ^XZ commands, those sections of the file must be split into separate formats, or combined as one format.
2. The characters used for the Format Command Prefix (^), Delimiter Character (,) and Control Command Characters (~) must be substituted for their Hexadecimal equivalents.
3. The ^XA and ^XZ commands must be removed from the formats.
4. The ^DF command should be removed.

## One Format per File

Files must contain only one format. This means that if a file contains multiple ^XA and ^XZ commands, those sections of the file must be split into separate formats, or combined as one format. For example, if a ZPL file contains both an initialization string and a format, the two sections must be either split into two files, or combined into one format.

For example, given the following formats:

```
^XA
^LT0^MNW^MTT^PON^PMN^LH0,0^JMA^PR2,2^LRN^CI0
^XZ
^XA
^FO20,100^IME:ZEBRA.BMP^FS
^A@N,75,75,TT0003M_.TTF
^FO20,400^FDZebra Technologies^FS
^XZ
```

The following file should be created, which includes all of the command in one file:

```
^XA
^LT0^MNW^MTT^PON^PMN^LH0,0^JMA^PR2,2^LRN^CI0
^FO20,100^IME:ZEBRA.BMP^FS
^A@N,75,75,TT0003M_.TTF
^FO20,400^FDZebra Technologies^FS
^XZ
```

## Character Substitution

The characters used for the Format Command Prefix (^), Delimiter Character (,) and Control Command Characters (~) must be substituted for their Hexadecimal equivalents. During normal operation, this is how the printer works with ZPL formats. For example, when a ZPL format is sent to the printer via a telnet, RS-232 or Ethernet connection and stored for later use, it automatically processes the file and makes these character substitutions.

When ZPL formats are sent to the printer from the "<update-root>/files" directory they are stored on the printers memory, but not processed. For this reason, it is necessary to preprocess the files so that they are ready for use.

The following character substitutions must be made to files sent from the "<update-root>/files" directory:

Original Character	Substitute Character
Command Prefix The default is the Caret (^)	HEX 1E
Delimiter Prefix The default is the comma ( , )	HEX 1F
Control Prefix The default is the tilde (~)	HEX 10

For example, given the following format:

```
^XA
^FO20,100^IME:ZEBRA.BMP^FS
^A@N,75,75,TT0003M_.TTF
^FO20,400^FDZebra Technologies^FS
^XZ
```

It would be necessary to replace the ^ characters with a HEX 1E and the , characters with a HEX 1F. This can be done using a Text Editor. See [Example Files on page 1424](#) for more information.

## Removing the ^XA and ^XZ commands

Additionally, the ^XA and ^XZ commands should be removed from the format. The printer will automatically add these commands back in to process the file. See [Example Files on page 1424](#) for more information.

## Removing the ^DF command

In some cases, you might have been using files that contain the ^DF command. The purpose of the ^DF command is to instruct the printer to store everything that comes after it in a ZPL file. For example, you might have a file that contains the following:

```
^XA
^DFE:STOREFMT.ZPL^FS
^FO25,25^AD,36,20^FN1^FS
^FO165,25^AD,36,20^FN2^FS
^FO25,75^AB,22,14^FDBUILT BY^FS
^FO25,125^AE,28,15^FN1
^XZ
```

The purpose of the above format - when sent to a printer - would be to store a file called "STOREFMT" to the E memory location on the printer. In production, the goal would be to recall and print the "STOREFMT" file using the following ZPL commands:

```
^XA
^XFE:STOREFMT.ZPL^FS
^FN1^FDZEBRA^FS
^FN2^FDPRINTER^FS
^XZ
```

When this is done using Mirror, the format being sent to the printer must be altered. The line with the ^DF command must be removed - this is because the Mirror process is taking care of storing the format to the E memory location. In this scenario, the original format would be edited to look like this:

```
^FO25,25^AD,36,20^FN1^FS
^FO165,25^AD,36,20^FN2^FS
^FO25,75^AB,22,14^FDBUILT BY^FS
^FO25,125^AE,28,15^FN1
```

The character substitution described above must also be done on the file before it is stored in the "<update-root>/files" directory.

The "recall" format - using the ^XFE:STOREFMT.ZPL command - does not need to be altered or edited. It can be used as it was previously.

## Example Files

Example of files that have already been altered in the manner described above are available as "Mirror File Examples" at [www.zebra.com](http://www.zebra.com).

To see an example file, right-click the paper-clip icon and select Open File or Save Embedded File to Disk 

## File Naming Recommendations

- Files in the "<update-root>/files" directory and "<update-root>/commands" directory should not have the same name.
- Files in the "<update-root>/files" should not contain multiple label formats. If you need to Mirror multiple formats, the recommended method is to split the formats into separate files.

## Command Use Recommendations

- Files in the "<update-root>/commands" directory should use only SGD commands or the following ZPL commands:
  - ~CC
  - ~CD
  - ~CT
  - ~JA
  - ~JL
  - ~JS
  - ~JX
  - ~RO
- Do not add a device.reset SGD command to the end of a file in the "<update-root>/commands" directory. Mirror will reset itself automatically after performing an update, so there is no need for this command.

## Configuration

This section provides detail on the configuring the printer and FTP server for Mirror.

### Mirror FTP Server Configuration

For a Zebra printer to successfully use Mirror, the Mirror FTP server must have the following:

- A client account (user name and password) for the printer to use
- A root (base) directory for Mirror updates. This root directory must have the following subdirectories:  
`/appl`  
`/files`  
`/commands`
- A Mirror feedback folder (optional)

**Important** • The printer's FTP user account must have the necessary permissions to read/write files in the update and feedback root directories. The `/appl`, `/files`, and `/commands` subdirectories are read only; the Mirror feedback folder is read/write. If these permissions are not properly set, the Mirror update and feedback processes will be unsuccessful.

### Mirror Printer Configuration

The following SGD commands are used to configure Mirror on the printer:

- |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## The Feedback.get File

The Feedback feature is one of the key benefits of the Mirror process. During a Mirror operation, the printer can upload a file to the FTP Server that contains information about the configuration of the printer. This information can then be leveraged by the Administrator to monitor the printer's setup. Using the Feedback feature is optional.

The "feedback.get" file is a template file stored on the printer. It controls what content is uploaded to the "<feedback-root>" directory on the FTP server. The directory on the FTP server where the printer will send Feedback content to is controlled by the "ip.mirror.feedback.path" command.

Within the feedback.get file it is possible to leverage SGD commands to insert current printer status and configuration strings into the file. This feature can help make the Feedback file on the FTP server more unique and useful to the Administrator.

Additionally, the first line of the feedback.get file is used to control the name of the file that will be uploaded and stored on the FTP server.

For example, if first line of the "feedback.get" file was:

```
"zebra.<wlan.mac_raw>.<ip.mirror.feedback.odometer>"
```

That line would be evaluated by the printer and used as the Feedback destination file name to create on the FTP server.

Using the example above, if the MAC address of the wireless print server was "00a0f8ae56d7" and the Feedback odometer was currently at "33", the Feedback file created the FTP server would be named:

```
"zebra.00a0f8ae56d7.33.txt"
```

The "feedback.get" file can be sent to the printer using the !CISDFCRC16 command. For additional information, see [CISDFCRC16 on page 651](#).

**Note** • The first line of the feedback.get file is not included when the Feedback data is written to FTP server.

## Example Feedback.get file

Here is an example of a "feedback.get" file and its resulting uploaded file:

```
zebra.<wlan.mac_raw>.<ip.mirror.feedback.odometer>
```

```
Application Name = <appl.name>
Serial Number = <device.friendly_name>
```

```
Mirror Success = <ip.mirror.success>
Mirror Auto = <ip.mirror.auto>
Mirror Path = <ip.mirror.path>
Mirror Last Update = <ip.mirror.success_time>
```

```
Bootp Enable = <ip.bootp.enable>
DHCP Enable = <ip.dhcp.enable>
Data Port = <ip.port>
Associated AP = <wlan.bssid>
RF ESSID = <wlan.essid>
RF Firmware = <wlan.firmware_version>
RF Signal Strength = <wlan.signal_strength>
RF Channel Mask = <wlan.channel_mask>
```

```
Label Length = <odometer.total_print_length>
Print Length = <odometer.label_dot_length>
```

When this file is processed by the printer and uploaded to the FTP server, the resulting upload file on the FTP server would contain data similar to this:

```

Application Name = V53.17.2Z
Serial Number = ZBR123456

Mirror Success = Yes
Mirror Auto = on
Mirror Path = /update-root/ZM400/
Mirror Last Update = 12345678

Bootp Enable = on
DHCP Enable = on
Data Port = 9100
Associated AP = 124
RF ESSID = MyEssid
RF Firmware = 5.2.1
RF Signal Strength = 98
RF Channel Mask = FF

Label Length = 100
Print Length = 200

```

## How to Set Up and Use Mirror

This section provides multiple scenarios which include specific examples that demonstrate how to set up and use Mirror.

### Scenario One

In this scenario, the printer is configured to perform a Mirror update operation ("`ip.mirror.auto = on`") and feedback operation ("`ip.mirror.feedback.auto = on`") every time the printer restarts. On startup, after a network connection has been established, the printer will attempt to make a FTP connection to the server address 10.14.5.133, using the "user name" and "password" of the printer.

If the connection is successful, the printer will attempt to perform an update operation using the root directory "`/all_printers/s4m/role1`". After the update operation is complete, the printer will attempt a Feedback operation, uploading the resulting Feedback file to the "`/all_feedback`" directory on the server.

Using the command set in the example below, the printer will not attempt any *periodic* Mirror Update or Feedback operations. It will only perform Mirror operations on startup or when explicitly instructed to using the "`ip.mirror.fetch`" command.

**Note** • If a file starts with "/" it signifies the base directory of that file system. If a file is contained in the user's account, they do not start with a "/" .

**Example:** This example shows a Mirror configuration command set. Each line item of the command set is identified with a number. For details on each line item, see the table below.

```
10 ! U1 SETVAR "ip.mirror.auto" "on"
20 ! U1 SETVAR "ip.mirror.username" "printer"
30 ! U1 SETVAR "ip.mirror.password" "printer"
40 ! U1 SETVAR "ip.mirror.server" "10.14.5.133"
50 ! U1 SETVAR "ip.mirror.path" "/all_printers/s4m/role1"
60 ! U1 SETVAR "ip.mirror.feedback.auto" "on"
70 ! U1 SETVAR "ip.mirror.feedback.path" "/all_feedback"
80 ! U1 SETVAR "ip.mirror.feedback.freq" "0"
```

1	Configures the printer to perform a Mirror Update operation at power-up.
2	Configures the FTP Server "user name" for the printer to use
3	Configures the FTP Server "password" for the printer to use
4	Configures the FTP server address the printer should make a FTP connection to.
5	If the FTP connection is successful, the printer should attempt to perform an Update operation using this root directory.
6	Configures a printer to automatically perform a Mirror Feedback operation at start-up.
7	Configures the printer to upload the resulting Feedback file to the designated directory on the server.
8	Configures a printer to repeat the Feedback operation zero times.

## Scenario Two

In this scenario, the printer is configured to not perform a Mirror Update function at start-up. It is configured to perform a Mirror Feedback operation at start-up and thereafter at every 60 minutes.

When the 60 minutes elapses, the printer will attempt to make a FTP connection to the server address 10.14.5.133. If the FTP connection is successful, the printer will attempt a Feedback operation, uploading the resulting Feedback file to the "/all\_feedback" directory on the server. After the initial Feedback operation, subsequent Feedback operations will occur at an interval of 60 minutes.

**Important** • Using the command set in the example below, for the printer to attempt any Mirror Update operation unless the "ip.mirror.fetch" command is sent to the printer.

**Example:** This example shows a Mirror configuration command set. Each line item of the command set is identified with a number. For details on each line item, see the table below.

```
10 ! U1 SETVAR "ip.mirror.auto" "off"
20 ! U1 SETVAR "ip.mirror.username" "printer"
30 ! U1 SETVAR "ip.mirror.password" "printer"
40 ! U1 SETVAR "ip.mirror.server" "10.14.5.133"
50 ! U1 SETVAR "ip.mirror.path" "/all_printers/s4m/role1"
60 ! U1 SETVAR "ip.mirror.feedback.auto" "on"
70 ! U1 SETVAR "ip.mirror.feedback.path" "/all_feedback"
80 ! U1 SETVAR "ip.mirror.feedback.freq" "60"
```

<b>1</b>	Configures the printer to not perform a Mirror Update operation at start-up
<b>2</b>	Configures the FTP Server "user name" for the printer to use
<b>3</b>	Configures the FTP Server "password" for the printer to use
<b>4</b>	Configures the FTP server address the printer should make a FTP connection to.
<b>5</b>	If the FTP connection is successful, the printer should attempt to perform an Update operation using this root directory.
<b>6</b>	Configures a printer to automatically perform a Mirror Feedback operation at start-up.
<b>7</b>	Configures the printer to upload the resulting Feedback file to the designated directory on the server.
<b>8</b>	Configures the printer to attempt a Feedback operation every 60 minutes.

## Troubleshooting

If a Mirror process completes unsuccessfully, troubleshooting information can be retrieved by sending this command to the printer:

```
! U1 GETVAR "ip.mirror.last_error"
```

[Table 56](#) lists possible printer responses, an explanation of each, and resolutions. [Table 57](#) provides problem scenarios and solutions.

**Important** • A mirror path can have up to 50 characters.

**Table 56 • Printer Response Troubleshooting**

Printer Response	Explanation	Resolution
"connection failed"	The network connection to the Mirror FTP server failed while attempting to perform a printer update.	<ul style="list-style-type: none"> <li>Check the user name, password, and server address for the Mirror FTP server and ensure that these values are set correctly in the printer.</li> <li>Ensure that the user name assigned to the printer has the proper permission to log into the Mirror FTP server.</li> <li>Check that the printer has a successful network connection and is able to send and receive network data.</li> </ul>
"Failed to get File: [filename]"	During an update operation, the printer's attempt to retrieve the file [filename] failed.	<ul style="list-style-type: none"> <li>Ensure that the printer's network connection has not been interrupted. If it has, re-establish network connectivity and retry the update.</li> <li>Check the server's access permissions for the user name assigned to the printer. Make sure the user name is granted access to read [filename] from the server.</li> </ul>
"feedback connection failed"	The network connection to the Mirror FTP server failed while attempting to send printer feedback.	<ul style="list-style-type: none"> <li>Check the user name, password, and server address for the Mirror FTP server and ensure that these values are set correctly in the printer.</li> <li>Ensure that the user name assigned to the printer have the proper permission to log into the Mirror FTP server.</li> <li>Check that the printer has a successful network connection and is able to send and receive network data.</li> </ul>

Table 56 • Printer Response Troubleshooting (Continued)

Printer Response	Explanation	Resolution
<b>"Failed getting file to parser : [filename]"</b>	During an update operation, the printer's attempt to retrieve a file [filename] in the <code>&lt;mirror_path&gt;/appl</code> directory failed.	<ul style="list-style-type: none"> <li>• Ensure that the printer's network connection has not been interrupted. If it has, re-establish network connectivity and retry the update.</li> <li>• Check the server's access permissions for the user name assigned to the printer. Make sure the user name is granted access to read [filename] from the server.</li> </ul>
<b>"Failed to send feedback file: &lt;feedback_path&gt;/&lt;feedback_filename&gt;"</b>	During a feedback operation, the printer's attempt to store the feedback file in the <code>&lt;feedback_path&gt;</code> directory failed.	<ul style="list-style-type: none"> <li>• Ensure that the printer's network connection has not been interrupted. If it has, re-establish network connectivity and retry the update.</li> <li>• Check the server's access permissions for the user name assigned to the printer. Make sure the user name is granted access to write to the <code>&lt;feedback_path&gt;</code> directory.</li> <li>• Ensure that the <code>&lt;feedback_path&gt;</code> directory exists on the remote server.</li> </ul>
<b>"Too many files in the firmware download directory"</b>	The Mirror FTP server has more than one file in the <code>&lt;mirror_path&gt;/appl</code> directory.	Ensure that there is only one (1) firmware file in the <code>&lt;mirror_path&gt;/appl</code> directory.

**Table 57 • Problem Scenario Troubleshooting**

Problem Scenario	Solution
I performed a Mirror Update and now my printer is continuously reprogramming.	<p>Ensure that the name of the firmware file in <code>&lt;mirror_path&gt;/appl</code> matches the version of firmware contained in that file.</p> <p><b>Example:</b> For firmware version V53.17.2Z, the name of the file in the <code>&lt;mirror_path&gt;/appl</code> directory must be <code>V53.17.2Z.ZPL</code> to prevent the continuous reprogramming cycle.</p>
Every time a Mirror Update is run, a file is fetched even though no changes have been made to the files on the server.	<ul style="list-style-type: none"><li>Check the names of the files in the <code>&lt;mirror_path&gt;/files</code> and <code>&lt;mirror_path&gt;/commands</code> directories. If the names are longer than 16 characters (minus extensions), then the printer will truncate them to 16 characters when downloading. If two filenames truncate to the same 16 characters, the printer will not be able to tell the difference between them and will re-download one of the two files during every update operation.</li><li>Check the names of the files in the <code>&lt;mirror_path&gt;/files</code> and <code>&lt;mirror_path&gt;/commands</code> directories. If any of the names are the same, then the printer will not be able to tell the difference. Therefore it will get the one in the files directory, update the timestamp file, and then it will get the one in the commands directory and update the timestamp file. Then, the next time through the one in the files directory will have a different timestamp, so it will get that file again and then check the commands directory, and so on.</li><li>Check the server's access permissions for the user name assigned to the printer. Make sure the user name is granted access to read all files in the <code>&lt;mirror_path&gt;/files</code> and <code>&lt;mirror_path&gt;/commands</code> directories.</li></ul>
The printer is continually rebooting.	<ul style="list-style-type: none"><li>Check the <code>/commands</code> directory. If a <code>file.delete</code> command resides, then you need to remove <code>file.delete</code> or modify your script.</li></ul>

## WML Overview

Wireless Markup Language (WML) offers a text-based method of designing customized menus on the LCD front panel of selected printers. By leveraging Set-Get-Do (SGD) and Zebra Programming Language (ZPL) commands, menus that feature both display and command features can be created. The WML “card” structure makes it possible to link from one menu screen to another, creating menus that are as many levels “deep” as desired or reduced to only those options needed by the printer operator.

For details on SGD commands, see [SGD Printer Commands on page 609](#). For details on ZPL commands, see [ZPL Commands on page 43](#).

## WML Details

A WML file is made up of tags, which are similar to HTML tags. For a list of the supported WML tags, see [WML Tags on page 1438](#).

Using WML on the printer is dependent on the presence of a single index.wml file, stored in the printer's E: memory. The index.wml file can contain one or more “cards”, with each card defining the content of a single menu. Everything within the card tag (<card> </card>) constitutes one complete front panel menu. Cards can also contain hyperlinks to other menus. If the index.wml has three cards, with links between the cards, that means there are three front panel menus. It is also possible to create multiple .wml files, with links between them and the index.wml file. In cases where multiple .wml files are used, it is recommended that each file should be structured to provide a link back to the main menu as described in the index.wml card.

**Note •** Only one `index.wml` file can reside on a printer at any time

WML defined menus can use Set-Get-Do (SGD) commands to retrieve or set printer settings. For example, a menu might display the printer's current baud rate, while also offering other potential baud rate settings for the printer selection. In more advanced uses, WML defined menus can cause ZPL command files, stored in the printer E: memory, to be injected into the printers command engine – where they will be read in and acted upon. In this use, the ZPL command file files are known as .nrd files.

For example, a WML defined menu could call an .nrd file that contains a customized set of printer configuration commands. In this way, different profiles can be created for the printer - making it possible for the printer operator to select the appropriate configuration profile needed for the task the printer is being used in.

An important concept to consider is that the WML menu completely defines what is displayed on the printers screen. If an item is not included in the WML menu definition it will not be displayed to the user.

**Note •** The `index.wml` file must reside on the printer's E: drive for the WML menu to display. If the `index.wml` file is on a drive other than E:, then the standard front panel menus display.

**Note** • When a WML menu is resident on the printer, the standard menu system can be easily be accessed by holding down the Cancel and Setup/Exit buttons (on the ZM400) or the Cancel and Setup/Exit buttons (on Xi4) or the Select button (on GX) on the front panel while the printer powers up. Hold the buttons down until the PRINT READY message displays on the front panel. To return to the WML defined menu, reset the printer again.

## Supported Printers

NEEDS TO BE UPDATED FOR LINK-OS PRINTERS IN A FUTURE RELEASE (CMM 06/2015)

WML is supported on the following printers, using the indicated firmware. The buttons on the printers' front panel that are used for Navigating WML defined menus are noted.

**Note** • When a WML defined menu is in use, the stripes pattern found at the top of selected printers is not displayed.

Table 58 • WML-Supported Printers

Printer	Firmware	Number of "lines" available	Menu Navigation Buttons	Keys to Access Standard Menu System
105SLPlus	V53.17.15Z (or later)	5	Select + (PLUS) - (MINUS)	Hold down CANCEL & SETUP/EXIT during power-up
Xi4™ series	V53.17.5Z (or later)	5	Select + (PLUS) - (MINUS)	Hold down CANCEL & SETUP/EXIT during power-up
ZE500™	V53.17.15Z (or later)	5	Select + (PLUS) - (MINUS)	Hold down CANCEL & SETUP/EXIT during power-up
ZM400™	V53.17.5Z (or later)	5	Select + (PLUS) - (MINUS)	Hold down CANCEL & SETUP/EXIT during power-up
ZM600™	V53.17.5Z (or later)	5	NEXT/SAVE + (PLUS) - (MINUS)	Hold down CANCEL & SETUP/EXIT during power-up
G™ -series	V56.17.5Z (or later)	4	SELECT SCROLL	Hold down SELECT during power-up

## Professional Services for WML Content Creation

Zebra offers a Professional Services group that can help with the creation of WML content. To inquire about Zebra's Professional Services, contact your Zebra account representative.

## WML Tags

**Table 1** shows the WML tags and tag parameters that can be used to create a menu system. As with other tag-based languages, such as HTML and XML, ending tags should be used to indicate the end of a structure. An example of an ending tag would be </wml>, which indicates the end of a WML script.

## Using WML

**Important** • Using end tags is required to create well formed and functional WML scripts.

**Table 59 • WML Tag Descriptions**

<wml> </wml>	indicates the beginning/end of the WML script
<display> </display>	indicates the beginning/end of the content to display on-screen
<card> </card>	indicates the beginning/end of a card
<p> </p>	indicates the beginning/end of a Paragraph
 	Line break
<a href="#menu">Menu</a>	Hyperlink to another card
<timer value="xx"> </timer>	Controls display timer in 10 <sup>th</sup> of a second increments
" ontimer="#main"	Controls action to take at timer end
alerts="on"	Controls display of on-screen alerts
\$(&command.command)	\$ executes a SGD "get" command
<do .....><setvar .....></do>	Controls execution of do and setvar commands

This section provides you with the necessary steps to prepare and transmit WML content to the printer. There are two methods to send WML content to the printer - via the FTP protocol or using the "CISDFCRC16" command. Both methods are detailed below.

The & (ampersand) character should not be used within the body of any Paragraph tag (<p>). If an ampersand is present within the body of a Paragraph tag, a WML-based menu may not function as expected.

The ampersand character should NEVER be used within a paragraph tag for any of the printer's soft keys (P1, P2, etc.); doing so can render the menu inoperable.

## Create a Sample index.wml File:

1. Open a text editor.
2. Type (or copy/paste) the following text:

```
<wml>
<display>
  <card>
    <p>Hello World!!</p>
  </card>
</display>
</wml>
```

3. Save this file with this name: `index.wml`.

## Prepare the Printer to Receive WML Content via FTP:

WML files – and any .nrd files used by a WML menu structure – must be stored in the printers E: memory location. While the files are first being transmitted to the printer, they should not be processed by the printers ZPL formatting engine. This can be done by configuring the SGD settings "ip.ftp.enable" and "ip.ftp.execute\_file".

The "ip.ftp.enable" setting allows the printer to receive content via the FTP protocol. The "ip.ftp.execute\_file" setting controls the printers' ability to process or not process commands received via the FTP protocol using the printers ZPL engine. By default, both settings are enabled.

1. Set "ip.ftp.enable" to "on" and the "ip.ftp.execute\_file" to "off".

### To do this, send these commands to the printer:

```
! U1 setvar "ip.ftp.enable" "on"
! U1 setvar "ip.ftp.execute_file" "off"
```

2. To confirm these commands are correctly set, send the getvar command to check the settings. To do this, send these commands to the printer:

```
! U1 getvar "ip.ftp.enable"
! U1 getvar "ip.ftp.execute_file"
```

If a terminal emulation program is being used, the following response should be returned from the printer.

"on""off"

**Note** • Only printers using the Internal 10/100 wired or Internal Wireless Plus & Wireless Plus print server can use the ! U1 setvar "ip.ftp.execute\_file" "off" command. For other print servers, use the "CISDFCRC16" command method detailed below.

## Send WML Content to the Printer via FTP

1. Go to a command prompt.
2. At the command line prompt, type "ftp xxx.xxx.xxx.xxx", where xxx.xxx.xxx.xxx is the IP Address of the printer. For example, if the IP Address of the printer is 10.3.5.34, the command would be:  
`ftp 10.3.5.34`
3. Press Enter to connect to the printer.
4. Press Enter to log in to the printer.
5. At the FTP prompt, type "put index.wml" and press Enter. The index.wml file will be transferred to the printer's E: memory.
6. Type "quit" to disconnect from the printer and exit FTP.
7. Power cycle the printer.

Once the printer completes the power cycle the display should look similar to this:

For additional index.wml examples, see [WML Examples on page 1443](#).

**Note** • When a WML menu is resident on the printer, the standard menu system can be easily be accessed by holding down the Cancel and Setup/Exit buttons (on the ZM400) or the Cancel and Setup/Exit buttons (on Xi4) or the Select button (on GX) on the front panel while the printer powers up. Hold the buttons down until the PRINT READY message displays on the front panel. To return to the WML defined menu, reset the printer again.

**Important** • When using the "ip.ftp.execute\_file" command, be sure to reset the command back to "on" for use in production processes. If the setting is left in the "off" configuration, when label formats or firmware are sent to the printer via FTP they will not be processed as intended – and the E: memory location can quickly become full.

## Resetting the "ip.ftp.execute\_file setting

1. To reset the "ip.ftp.execute\_file" setting to the default state, send the following command to the printer.  
`! U1 setvar "ip.ftp.execute_file" "on"`

## Sending WML Content to the Printer via the CISDFCRC16 Command:

WML files – and any .nrd files used by a WML menu structure – must be stored in the printers E: memory location. While the files are first being transmitted to the printer, they should not be processed by the printers ZPL formatting engine. This can be done by using the CISDFCRC16 command. This command allows content to be written directly to the E: memory location, without being processed by the printers ZPL formatting engine. By using the CISDFCRC16 command, WML content can be transmitted to the printer via the Serial, USB or Parallel ports.

For additional information on the CISDFCRC16 command, see [page XX](#).

1. To send the sample index.wml shown earlier, send the following commands to the printer:

```
! CISDFCRC16
0000
INDEX.WML
0000004E
0000
<wml>
<display>
<card>
<p>Hello World!!</p>
</card>
</display>
</wml>
```

2. Power cycle the printer.

Once the printer completes the power cycle the display should look similar to this:

For additional index.wml examples, see [WML Examples on page 1443](#).

**Note** • When a WML menu is resident on the printer, the standard menu system can be easily be accessed by holding down the Cancel and Setup/Exit buttons (on the ZM400) or Cancel and Setup/Exit buttons (on Xi4) on the front panel while the printer powers up. Hold the buttons down until the PRINT READY message displays on the front panel. To return to the WML defined menu, reset the printer again.

## Retrieving WML Content from the Printer using the file.type Command:

It is possible to retrieve .wml file content from the printer using the "file.type" SGD command. To do this, open a terminal emulation connection to the printer and issue the command. For example, to retrieve the contents of the INDEX.WML file, use the following command:

```
! U1 setvar "file.type" "E:INDEX.WML"
```

**Note** • The **file.type** command is case sensitive – if the file is stored on the printer as **INDEX.WML**, the command must use that same case. Additionally, you should note that **.nrn** files are treated as confidential – they cannot be retrieved from the printer.

## Using .nrn Files from WML Menus

It is possible to have a WML menu send the contents of a ZPL or SGD file to the printer to be processed. In this way, the WML menu can leverage complex command scripts in response to the user pressing a single button on the printer. One possible use for this capability would be to create a series of "profile" files that contain all the settings necessary to reconfigure the printer for different uses.

The command files are known as ".nrn" files and are stored directly on the printers E: memory location. The .nrn files can be created using a standard text editor and sent to the printer via FTP or using the CISDFCRC16 command. Files should have an ".nrn" extension.

## Removing WML or .nrn Files from the Printer using the file.delete Command:

It is possible to remove .wml files from the printer using the file.delete SGD command. To do this, open a terminal emulation connection to the printer and issue the command. For example, to remove the **INDEX.WML** file, use the following command:

```
! U1 do "file.delete" "E:INDEX.WML"
```

## WML Examples

The examples shown below “build” from a simple, display-only, WML menu to a more complex interactive example that uses .nrd files containing ZPL commands. In the initial examples, all lines are explained in detail, in the later examples only the new concepts are covered in detail.

Indenting is used in the examples below to improve readability, it is not necessary in actual use.

### Example 1

This example shows a basic WML menu structure that uses only fixed text. The content below shows the WML script plus numbered callouts and a table that identify the function of each of the WML tags.

```
1 ➔ <wml>
2 ➔   <display>
3 ➔     <card>
4 ➔       <p>Hello World!!</p>
5 ➔     </card>
6 ➔   </display>
7 ➔ </wml>
```

1	Beginning of the WML file.
2	Beginning of the content to be displayed.
3	The <card> tag begins the definition of this menu.
4	The <p> begins a paragraph, here displaying Hello World! The </p> ends the paragraph
5	The </card> tag ends the definition of this menu.
6	End of the content to be displayed.
7	End of the WML file.

In use, this WML menu looks similar to this:

## Example 2

This example demonstrates a WML menu structure that uses fixed text, plus two SGD commands to display the current printer settings for the Baud rate and ESSID settings on the printer.

```

1→  <wml>
2→  <display>
3→    <card>
4→      <p>Baud: $(comm.baud)</p>
5→      <br/>
6→      <p>AP: $(wlan.essid)</p>
7→    </card>
8→  </display>
9→ </wml>

```

<b>1</b>	Beginning of the WML file.
<b>2</b>	Beginning of the content to be displayed.
<b>3</b>	The <b>&lt;card&gt;</b> tag begins the definition of this menu.
<b>4</b>	The <b>&lt;p&gt;</b> begins a paragraph. ‘Baud’ displays the text Baud: \$(comm.baud) retrieves and displays the printers’ current baud rate. The <b>&lt;/p&gt;</b> ends the paragraph.
<b>5</b>	A line break
<b>6</b>	The <b>&lt;p&gt;</b> begins a paragraph. “AP:” displays the text AP: \$(wlan.essid) retrieves and displays the printers’ current ESSID setting. The <b>&lt;/p&gt;</b> ends the paragraph.
<b>7</b>	The <b>&lt;/card&gt;</b> tag ends the definition of this menu.
<b>8</b>	End of the content to be displayed.
<b>9</b>	End of the WML file

In use, this WML menu looks similar to this:

## Example 3

This example demonstrates a WML menu structure with two menus. Fixed text and SGD commands are used to display the current printer settings for the Baud rate and ESSID settings on menu one and the Firmware version and ZBI State on menu two. Through use of the ‘timer’ setting, the menu will automatically return to a defined WML card if no buttons are pressed after a set time period. The menu is configured to allow printer alerts (such as HEAD OPEN) to be displayed.

```

1→  <wml>
2→  <display>
3→    <card id="main" title="" ontimer="#main" alerts="on">
4→      <timer value="50"></timer>
5→      <p>Baud: $(comm.baud)</p>
6→      <br/>
7→      <p>AP: $(wlan.essid)</p>
8→      <p> </p><br/>
9→      <p> </p><br/>
10→     <p>     <a href="#system">Firmware</a></p>
11→   </card>
12→   <card id="system" title="" ontimer="#main" alerts="on">
13→     <timer value="50"></timer>
14→     <p>Firmware:</p><br/>
15→     <p>$(appl.name)</p><br/>
16→     <p>ZBI State:</p><br/>
17→     <p>$(zbi.key)</p><br/>
18→     <p>     <a href="#main">Main</a></p>
19→   </card>
20→ </display>
21→ </wml>
```

<b>3</b>	<card id="main" – defines the card’s id – "main". title="" – defines the title (not displayed on screen). ontimer="#main" – defines the WML card to display when the timer runs out. alerts="on"> – enables the alerts display feature.
<b>4</b>	<timer value="50"></timer> – sets the timer to 50 (in 10 <sup>th</sup> of a second increments).
<b>10</b>	<p>     <a href="#system">Firmware</a></p> – defines a link to the “system” card.
<b>12</b>	<card id="system" – defines the card’s id – "system". title="" – defines the title (not displayed on screen). ontimer="#main" – defines the WML card to display when the timer runs out. alerts="on"> – enables the alerts display feature.
<b>13</b>	<timer value="50"></timer> – sets the timer to 50 (in 10 <sup>th</sup> of a second increments).
<b>18</b>	<p>     <a href="#main">Main</a></p> – defines a link to the “main” card.

In use, these two WML menus look similar to this:

Baud: 9600

AP: 125

Firmware

Firmware:

V53.17.2

ZBI State:

Enabled

Main

**Note** • GX series printers can display four lines of text. If you are using a GX series printer, remove one line of text from each “card” to use this example.

## Example 4

This example demonstrates a WML menu structure that creates two menu screens and a link to a command file – “config.nrd” – that contains a ZPL command that will cause the unit to print a configuration label.

```

1→  <wml>
2→  <display>
3→      <card id="main" title="" ontimer="#main" alerts="on">
4→          <timer value="50"></timer>

In use, these WML menus look similar to this:

**Note** • GX series printers can display four lines of text. If you are using a GX series printer, remove one line of text from each “card” to use this example.

## Troubleshooting Scenarios

Problem Scenario	Corrective Actions
I loaded a WML menu structure on the printer, but the Factory menu structure is displaying.	<ul style="list-style-type: none"> <li>• "The WML files may have syntax errors. Reconfirm that the correct syntax has been used. When creating WML files it is recommended to start with a simple structure, validate that it's functional and build additional content onto the "known good" example</li> <li>• "Power cycle the printer and watch the start-up sequence - if a "WML ERROR" message displays during the start-up, the index.wml file has a syntax error that needs to be corrected.</li> <li>• "The index.wml file may not have been successfully transferred to the printer. Use a terminal emulation program and the following command to retrieve the index.wml file to the PC for examination: <code>! U1 setvar "file.type" "E:INDEX.WML"</code></li> <li>• "The index.wml file may not be present in the E: memory location. Validate that the file is present and correctly named.</li> <li>• "Confirm that straight quotes were used in all instances where the quote character was used (use the " character - not " or ?). SGD commands require the use of the straight quote.</li> <li>• "Confirm that the "WML Menu Cancel" buttons, (Setup and Cancel or Cancel and Setup/Exit or Select) were not held down during start up. These actions will cause the standard menu to display</li> </ul>
Some characters in the menu are cut off or some lines are not displaying at all.	<ul style="list-style-type: none"> <li>• Characters that extend past the width of the display are truncated, reposition the field as needed.</li> <li>• Check that you have not exceeded that maximum number of lines the display allows (5 lines on ZM and Xi4 series units, 4 lines on the GX series).</li> </ul>
My WML menu structure is displaying, but one of the "cards" is not displaying or is unreachable.	<ul style="list-style-type: none"> <li>• The missing "card" may not have been linked to from any of the visible "cards". Review your WML content to ensure that the correct links exist.</li> <li>• The WML files may have syntax errors, reconfirm that the correct syntax has been used. When creating WML files it is recommended to start with a simple structure, validate that it's functional and build additional content onto a known good example.</li> <li>• If the missing card content is contained in a separate .wml file, confirm that the necessary .wml files have been transferred to the printer.</li> </ul>

Problem Scenario	Corrective Actions
My WML menu structure uses SGD commands to display current settings, but the settings are not displaying.	<ul style="list-style-type: none"> <li>• Validate that the correct syntax was used for the SGD command.</li> <li>• Check the manual page for the command being used. Confirm that the command is supported by the printer &amp; firmware. Use a terminal emulation program to send just the command being used to validate it functions outside the WML menu structure.</li> <li>• Confirm that straight quotes were used in all instances where the quote character was used (use the " character – not “ or ”). SGD commands require the use of the straight quote.</li> <li>• Characters that extend past the width of the display are truncated, reposition the field as needed.</li> <li>• Check that you have not exceeded that maximum number of lines the display allows (5 on ZM and Xi4 series units).</li> </ul>
My WML menu structure used SGD commands to allow the user to alter printer settings, but the settings are not getting changed as expected.	<ul style="list-style-type: none"> <li>• Validate that the value being used in the <code>value=</code> parameter of the <code>&lt;do&gt;</code> tag is supported by the SGD command.</li> <li>• Validate that the correct syntax was used for the SGD command.</li> <li>• Check the manual page for the command being used. Confirm that the command is supported by the printer &amp; firmware. Use a terminal emulation program to send just the command being used to validate it functions outside the WML menu structure.</li> <li>• Confirm that straight quotes were used in all instances where the quote character was used (use the " character – not “ or ”). SGD commands require the use of the straight quote.</li> </ul>
My WML menu structure uses .nrd files to send commands to the printers ZPL or SGD engine, but the commands don't seem to be getting sent when the user selects the on-screen link for the action.	<ul style="list-style-type: none"> <li>• Confirm that the .nrd files are present in E: memory and named as expected. Resend or rename the files if necessary.</li> <li>• Confirm that the WML menu structure is using the correct file name(s).</li> <li>• Confirm that the commands in the files work as expected, independently of the WML menu or <code>.nrd</code> file.</li> <li>• Validate that ZPL and SGD commands have not been interlaced.</li> </ul>
I am using the <b>CISDFCRC16</b> command to transfer files, but the files are either not being transferred to the printer or are showing up with a zero (0) byte size.	<ul style="list-style-type: none"> <li>• Confirm that the Hexadecimal value used for the File Size parameter is correct. This value must be an eight digit file size specified in hexadecimal which indicates the number of bytes in the <code>&lt;data&gt;</code> section of the command. See the full manual page on the CISDFCRC16 command for additional details.</li> <li>• Validate that the CRC and Checksum parameters are correct (using the "0000" value for these parameters is recommended).</li> <li>• Confirm that the WML file name and extension are in upper case characters.</li> <li>• Confirm that the exclamation mark (!) was included before the command name ("! <b>CISDFCRC16</b>").</li> </ul>

# Using Weblink

Weblink is a feature of Zebra Link-OS™ printers. Using a secure connection, the Weblink feature allows the printer to directly connect to an internet based server, for the purpose of either sending information to the server or receiving from the server. Weblink can transport data securely through a firewall.

## When Should Weblink be Used?

Weblink can transport any information related to device management, transactional data and information to be processed at a later time. It can be used as part of an overall cost reduction solution that leverages web technologies.

Typically, an application called a 'servlet' is created and run on the internet based server, waiting for printers to connect and interact with the servlet. These servlet applications can provide a variety of functions – from sending operating system updates to the printer, to receiving data from the printer and, in turn, using that data to trigger events in other systems.

For example, a solution could be created that would feature the printer consuming data from a Bluetooth® scanner connected to the printer – with that scanned data then being sent from the printer to the internet-based servlet. The servlet would then seek out additional details related to the scanned data, format a document, and then send it to the printer for printing.

## Configuring Weblink

When any WebLink setting (with the exception of the logging settings) is adjusted either via SNMP, SGD, or JSON it is required that the printer be reset before the new value takes effect. The `weblink.printer_reset_required` setting will be set to "yes" if there are any settings that have been modified that require a printer reset.

## Basic Configuration

To determine how much configuration is necessary the following questions should be considered:

1. Is the remote server the printer is attempting to connect to outside the corporate firewall?
2. Does the firewall require a username and password to access the remote server?
3. Does the printer require a proxy server to access the remote server?

4. Does the firewall permit HTTPS connections initially or does the printer need to connect via HTTP first?

If the answer to any of these questions is 'yes', then more than the basic configuration may be necessary. Depending upon the network environment that the printer is in, accessing the remote server may only require that a few settings be set.

The minimum requirement is that the URL for the remote server be set. For simplicity, assume that only conn1 is being used (this is the typical scenario). See also *Difference Between Conn1 and Conn2 on page 1457*.

To configure the printer to connect to the remote server:

- a. Set **weblink.ip.conn1.location** to the URL of the remote server.

The URL must conform to the standards described in RFC3986 (<http://www.ietf.org/rfc/rfc3986.txt>). For example, if the remote servlet's full URL is **https://www.examplecorpinc.com/zebra/weblink/**

Configure the location setting as follows:

```
! U1 setvar "weblink.ip.conn1.location"  
"https://www.examplecorpinc.com/zebra/weblink/"
```

- b. Reset the printer.

When the printer has an IP address, it will attempt to connect to the remote server. In the event that the remote server does not indicate that the printer has connected, logging may need to be enabled in order to determine the failure.

## When a Proxy Server is Part of the Network Configuration

If a proxy server must be used to access the remote server, the printer's proxy setting must be set to connect to the server. There are typically four properties associated with a proxy server:

- The proxy server scheme: **HTTP** or **HTTPS**
- The proxy server address
- The proxy server port (optional)
- The username and password for the proxy (optional)

To supply the address of the proxy server (assuming a default port and no username/password), configure the proxy setting as follows:

```
! U1 setvar "weblink.ip.conn1.proxy" "https://my.internal.proxy/"
```

In this scenario the proxy address is **my.internal.proxy** and the scheme is **HTTPS**. The default port (1080) will be used. No username or password will be used to authenticate with the proxy.

To specify an alternate port configure the proxy as follows:

```
! U1 setvar "weblink.ip.conn1.proxy"  
"https://my.internal.proxy:3128/"
```

To specify a username and password configure the proxy as follows:

```
! U1 setvar "weblink.ip.conn1.proxy"  
"https://user:pass@my.internal.proxy/"
```

The proxy username, password, and the rest of the URL must follow the rules specified in RFC3986 (<http://www.ietf.org/rfc/rfc3986.txt>).

## When HTTP Authentication is Necessary

Use this configuration when, for example, a firewall requires a username and/or password.

It may be necessary to specify a username and password to various routers and servers along the path to the remote server. Typically when using a browser to access the server the authentication request will be presented in the form of a dialog window that asks for the username and password.

Since the printer's connection to the remote server is headless and non-interactive, the Weblink configuration allows a user to enter in a server name/username/password triplet. The triplet will be used in the event that the printer is presented with an authentication request (for example, this typically is requested via the **HTTP/1.1 401 Unauthorized** request).

To specify authentication credentials, issue the following:

```
! U1 setvar "weblink.ip.conn1.authentication.add" "servername.com  
username password"
```

In this scenario the server requesting authentication is servername.com. The username and password to be supplied are 'username' and 'password'. The server name can be either a DNS name or an IP address. The username and password cannot be retrieved from SGD, SNMP, or JSON once added. Only the server name will be returned.

More than one set of authentication triplets can be added. The printer will only use the credentials as they are needed. In other words, the printer will only use the credentials for servername.com if it receives a **HTTP/1.1 401 Unauthorized** request from servername.com.

To see what authentication triplets are specified issue:

```
! U1 getvar "weblink.ip.conn1.authentication.entries"
```

To remove authentication credentials issue the following:

```
! U1 setvar "weblink.ip.conn1.authentication.remove"  
"servername.com"
```

## Additional Firewall Configuration

Some firewalls do not allow the first connection attempt for a device to be HTTPS or require new connections periodically to keep the initial connections intact. The weblink test branch was provided to address issues that typically arise because the printer is an unattended device.

To configure the printer to attempt an **HTTP** connection anytime the **HTTPS** connection drops :

```
! U1 setvar "weblink.ip.conn1.test.location"  
"http://www.zebra.com/apps/linktest"  
! U1 setvar "weblink.ip.conn1.test.test_on" "failure"
```

The weblink.ip.conn1.test.location can be any valid HTTP address. The default uses a link provided by Zebra that exists for no other purpose than to help developers test their connections to the internet. Setting **weblink.ip.conn1.test.test\_on** to interval or both will force the printer to attempt a connection to the URL in location every **weblink.ip.conn1.test.retry\_interval** seconds (default is 900 seconds/15 minutes).

To configure the printer to try an HTTP connection periodically, independent of the HTTPS success:

```
! U1 setvar "weblink.ip.conn1.test.location"  
"http://www.zebra.com/apps/linktest"  
! U1 setvar "weblink.ip.conn1.test.test_on" "interval"  
! U1 setvar "weblink.ip.conn1.test.retry_interval" "900"
```

## Difference Between Conn1 and Conn2

The printer has the ability to connect to two different servers. Connection 1 (conn1) and Connection 2 (conn2) are identical in every way in terms of their configuration. It is expected that conn2 will typically be left unmodified unless a user has an alternate server that they wish to use to configure the printer.

A typical scenario in which both connections would be used is if a user wishes to have the printer connect to both a configuration server and a data source.

## Enable Logging

If your printer has trouble connecting, you may wish to enable logging. By default logging is not enabled in order to reduce the amount of memory consumed when the Weblink feature is enabled. It is recommended that once the Weblink feature is configured properly and is performing as expected that the logging be disabled or that a very small (less than 100) number of logging entries be permitted.

To enable logging, **weblink.logging.max\_entries** needs to be modified. By default it is set to 0, which indicates that no messages are logged. When attempting to troubleshoot connection issues it is recommended that **max\_entries** be set to at least 100 entries. Setting **max\_entries** to 100 means that the 100 newest logging entries will be present in **weblink.logging.entries** as older entries are discarded once the maximum number of entries is reached.

```
! U1 setvar "weblink.logging.max_entries" "100"
```

The logging settings are atypical to the Weblink settings as they do not require the printer to be reset before taking effect. This does not mean that previous logging message that would have been logged will appear when the **max\_entries** setting is changed from 0 to a greater value. It means that any new logging messages will be logged from that point forward.

Issue the following command to clear any log entries currently in the **weblink.logging.entries** buffer.

```
! U1 do "weblink.logging.clear" ""
```

## Navigating the Log Output

The log will contain useful information, even in the scenario where the printer successfully connects to the remote server. This section explains how to read the log and highlights some of the key entries that will help to determine if the connection was successful.

A typical log entry looks as follows:

```
[12-04-2012 14:57:10.625] [conn1.1] Attempting connection to  
https://www.examplecorpinc.com/zebra/weblink/
```

The first column is the date and time that the event occurred. The format of the date and time matches the format of **rtc.date** and **rtc.time**. The time, however, also includes the milliseconds to aid in troubleshooting network latency concerns.

**Note** • For printers that do not have a battery to store the Real Time Clock (RTC) value, the date will be restored to the default value upon a power cycle. The default value depends upon how the **rtc.date** SGD is managed. If it has never been set then it will default to the firmware build date (the value in **appl.date**). Otherwise, the value in **rtc.date** will default to the value that it was last set to. This does not mean the value of the **rtc.date** when it was power cycled. It means that when a user sets **rtc.date** that becomes the new default value.

If the printer has a battery then the **rtc.date** is never default and continues to track the date as expected.

The second column indicates the connection name and channel that the entries are associated with. The connection name will match the weblink branch that was configured with the respective URL (for example, conn1 or conn2). The channel number indicates which channel on the respective connection the entries corresponds to.

**Note** • Channels are additional connections that are requested by the server when the server needs to perform a specific operation that cannot be done on the channel(s) currently open. Typically only the RAW channel is open which operates similar to the RAW TCP port. It is typical to see two channels opened, the main channel and the RAW channel.

The third column is the actual message that contains information about what occurred in the printer at the corresponding time in column one. In the above example the printer was initiating the connection to the URL specified in **weblink.ip.conn1.location**.

Review the section titled [SSL/TLS Certificate Errors on page 1459](#) to understand what it means when certain logging messages/errors appear in the log.

## SSL/TLS Certificate Errors

Secure connections to the remote server present the opportunity for several errors when attempting to connect. The errors typically involve the certificates used when connecting via SSL or TLS. This section highlights some of the most common issues involving the certificates.

Error	Cause / Solution
<b>"SSL certificate problem: self signed certificate in certificate chain"</b>	<p>One of the situations that prevent a successful connection is not having the correct Certificate Authority certificates installed on the remote server. Zebra requires that the Zebra Root Certificate Authority and the Zebra Subordinate Certificate Authority be installed on the remote server. This error typically indicates that only one of the Zebra Certificate Authority certificates is installed on the remote server.</p> <p> <b>Important</b> • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.</p>
<b>"SSL certificate problem: unable to get local issuer certificate"</b>	<p>One of the situations that prevent a successful connection is not having the correct Certificate Authority certificates installed on the remote server. Zebra requires that the Zebra Root Certificate Authority and the Zebra Subordinate Certificate Authority be installed on the remote server. This error typically indicates that neither of the Zebra Certificate Authority certificates are installed on the remote server.</p> <p> <b>Important</b> • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.</p>

Error	Cause / Solution
<b>"SSL certificate problem: certificate has expired"</b>	<p>This error indicates that the remote server's certificate has expired. This is typically an indication that the printer's date and/or time are incorrect as the Zebra certificates are typically issued for long durations. Check that <b>rtc.date</b> and <b>rtc.time</b> are set correctly.</p> <p> <b>Note</b> • For printers that do not have a battery to store the Real Time Clock (RTC) value, the date will be restored to the default value upon a power cycle. The default value depends upon how the <b>rtc.date</b> SGD is managed. If it has never been set then it will default to the firmware build date (the value in <b>app1.date</b>). Otherwise, the value in <b>rtc.date</b> will default to the value that it was last set to. This does not mean the value of the <b>rtc.date</b> when it was power cycled. It means that when a user sets <b>rtc.date</b> that becomes the new default value.</p> <p>If the printer has a battery then the <b>rtc.date</b> is never default and continues to track the date as expected.</p> <p> <b>Important</b> • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.</p>
<b>"SSL certificate problem: certificate is not yet valid"</b>	<p>This error indicates that the remote server's certificate was incorrectly issued or that the printer's date and/or time are incorrect. Check that the printer's date and time (<b>rtc.date</b> and <b>rtc.time</b>) are set correctly and that the certificate's start and expiration date are valid.</p> <p> <b>Note</b> • For printers that do not have a battery to store the Real Time Clock (RTC) value, the date will be restored to the default value upon a power cycle. The default value depends upon how the <b>rtc.date</b> SGD is managed. If it has never been set then it will default to the firmware build date (the value in <b>app1.date</b>). Otherwise, the value in <b>rtc.date</b> will default to the value that it was last set to. This does not mean the value of the <b>rtc.date</b> when it was power cycled. It means that when a user sets <b>rtc.date</b> that becomes the new default value.</p> <p>If the printer has a battery then the <b>rtc.date</b> is never default and continues to track the date as expected.</p>

Error	Cause / Solution
<b>"subjectAltName does not match 1.2.3.4"</b>	Part of the certificate validation process involves making sure that the remote server is who it claims to be. A certificate can be created to validate against several aliases/DNS names. Typically the certificate will not contain the IP address of the server as IP addresses are subject to change. When specifying the remote server's URL via <code>weblink.ip.conn1.location</code> be sure to specify one of the DNS aliases listed in the certificate. The valid names will be listed either under the Common Name (CN) field and/or the subjectAltName (SAN or Subject Alternate Name) field within the certificate. For example, the certificate may have the CN set to ' <code>examplecorpinc</code> ' and the SAN set to ' <code>examplecorpinc.com</code> ' or ' <code>alias.for.examplecorpinc.com</code> '. Any of the CN or SAN names can be used, but, as the IP address is not listed in the CN or SAN it cannot. It is not recommended that the IP address be part of the SAN if a DNS name is available to avoid connection issues that may arise due to subnet change or DHCP lease expirations, etc.
 <b>"SSL certificate subject name 'examplecorpinc.com' does not match target host name '1.2.3.4'"</b>	<b>Important</b> • When using certificate files, the time on the printer must be set correctly for the websocket connection to succeed, as the time is used in the certificate validation.
<b>"Unknown SSL protocol error in connection to ..."</b>	When this message is seen it means that the remote server's SSL/TLS configuration is incorrect. Refer to <a href="#">Troubleshooting on page 1462</a> to ensure the server and printer are both configured correctly.
I do not see any of these errors, but the printer still does not connect.	Refer to <a href="#">Troubleshooting on page 1462</a> to ensure the server and printer are both configured correctly.

## Other Typical Errors

While SSL/TLS connection errors are the most common, there are issues that can arise that prevent a successful connection. This section highlights the most common issues.

Error	Cause / Solution
<b>"Read failed with an unexpected error"</b>	<p>This message typically indicates that connection to the remote server was lost. The connection can either be lost due to the server powering off or resetting, the firewall or proxy server shutting down the connection, or because the remote server gracefully requests that the connection be discontinued.</p> <p> <b>Note</b> • After 60 seconds of inactivity on the connection the printer will attempt to contact the server via a TCP Keepalive. If the connection is still present the server will respond and the connection will remain open. After 10 successive failed attempts to contact the remote the printer will assume the connection is severed and close the connection. The printer will resume its attempt to connect to the remote server so that when the server comes back online the printer will re-establish communication.</p>
<b>"Failed to connect (SP = #, CI = #, UW = #, AC = #, PC = #)"</b>	<p>If this error is seen one or more of the '#' values will be set to 0. This is an indication of an incorrect configuration of the remote server. Ensure that the remote server is setup according to the Servlet configuration in the Zebra Link-OS SDK documentation.</p> <p>This typically indicates an incorrect version of the remote Application Server (for example, Apache/Tomcat version may be incorrect). If this issue persists contact Zebra Technical Support.. See <i>Contacts on page 9</i> and provide the output of the following command (ensure that logging is enabled and that this error appears within the entries).</p> <pre>! U1 getvar "weblink"</pre>

## Troubleshooting

Whenever troubleshooting a connection issue, the following questions should be answered to ensure the configuration is correct.

1. Is the printer connected correctly via Wireless or Ethernet?
2. Does the printer have a valid IP address?
3. Can I ping the printer's IP address from a device on the same network as the printer?
4. Is the remote server URL in **weblink.ip.conn1.location** correct and does it point to the remote server that is configured for weblink functionality?
5. Can you connect to the location defined in the **weblink.ip.conn1.location** setting via a browser?
6. Is the remote server I am attempting to connect to outside the corporate firewall?

7. Can the URL specified in **weblink.ip.conn1.location** be accessed?  
If this is the case, talk with your administrator about altering restrictions for accessing HTTPS connections.
8. Does the firewall require a username and password to access the remote server?
9. Do I require a proxy server to access the remote server?
10. Is the proxy server port the default (1080) or another port (for example, 3128 for the Linux Squid proxy)?

**Note** • If using the Linux Proxy Server Squid, and you are having trouble connecting, note that it may be configured to:

- a. disallow POST messages
- b. only operate in HTTP/1.0 mode
- c. disallow SSL connections.

Refer to your Linux Squid documentation for complete details.

11. Does the firewall permit HTTPS connections initially or do I need to connect via HTTP first?
12. Is the remote server configured to use SSL v3.0 or TLS 1.0?  
TLS 1.0 is recommended, but SSL v3.0 is also supported. Versions prior to SSL v3.0 and later than TLS v1.0 are not currently supported.
13. Are the Zebra Certificate Authority Certificates correctly installed on the remote server?
14. Was the server's certificate issued by Zebra and is it signed by the Zebra Certificate Authority?
15. Has the server's certificate expired?
16. Is the printer's date and time within the issue and expired period of the server's certificate?
17. Does the value in **weblink.ip.conn1.location** match either the Common Name or one of the names listed in the Subject Alternate Name of the remote server's certificate?
18. Is the proxy server configured correctly and does the respective proxy server allow HTTPS connections via the HTTP CONNECT method?
19. Are there any HTTP authentication attempts when trying to connect that fail?
20. Are there any HTTP/1.1 4xx messages in the log?

If your connection issues persist and the solutions in this document do not help, contact Zebra Tech Support and provide the output of the following command. Ensure that logging is enabled and that the error(s) appear within the entries)

```
! U1 getvar "weblink"
```

## HTTP Messages

Message	Cause / Solution
<b>HTTP/1.1 100 Continue</b>	This indicates that the server and printer have begun communicating and is often seen in place of <b>HTTP/1.1 200 OK</b> .
<b>HTTP/1.1 101 Switching Protocols</b>	This indicates that the basic connection to the server worked and the protocol is being switched to a more efficient protocol for data transfer.
<b>HTTP/1.1 200 OK</b>	This indicates that an <b>HTTP GET</b> or <b>HTTP POST</b> was successful.
<b>HTTP/1.1 30x Moved/Redirect/etc</b>	This indicates that the URL specified has moved or that the firewall redirected the printer to another location (typically this is done to authenticate a user in a transparent proxy configuration).
<b>HTTP/1.1 401 Unauthorized</b>	This indicates that the printer either needs to authenticate with the server or failed to authenticate with the remote server (or server/router along the route to the server).
<b>HTTP/1.1 403 Forbidden</b>	This typically means that the authentication was provided and valid, however, the user does not have access to the requested resource.
<b>HTTP/1.1 404 Not Found</b>	This indicates that the remote URL provided points to an invalid location on the server. This does indicate, however, that the server name is valid. Just the path after the domain name is invalid.

# HTTP POST Alerts

Link-OS printers can issue alerts to a web server that is listening for HTTP POST requests. The advantage of an HTTP POST alert over the other destinations available (for example, TCP, UDP, SNMP) is that HTTP is firewall friendly.

## Configuring Alerts Where the Alert Destination is HTTP POST

Any setting in the `alerts.http` branch that is set will take effect for any **HTTP POST** alerts that occur from that point forward. A printer reset is not required for the settings to take effect.

If the server is configured to accept and process **HTTP POST** messages either via a CGI script or a server-side script such as PHP or ASP then the alert can be forwarded to that server from the printer. The printer will send the alert using the multipart/form-data Content-Type. This allows any type of data, including binary data, to be sent via the **POST**.

The **POST** will support two variables within the body of the **POST**:

- `alertMsg` – This is the alert details and the content follows the format of a standard alert when it is issued over one of the other alert destinations (for example, serial, USB, TCP, etc.).
- `uniqueId` – The unique id of the printer. This matches the value in `device.unique_id`.

The HTTP POST request will look as follows (sent when the printer was paused)

```
POST /http_post/alert.php HTTP/1.1
Host: 10.3.4.58
Accept: /*
Connection: close
Content-Length: 281
Expect: 100-continue
Content-Type: multipart/form-data; boundary=-----
-----350c75835f46

-----350c75835f46
Content-Disposition: form-data; name="alertMsg"

ALERT%3A%20PRINTER%20PAUSED
-----350c75835f46
Content-Disposition: form-data; name="uniqueId"

XXQLJ120900310
-----350c75835f46--
```

**Important** • The message is using HTTP/1.1 and therefore HTTP/1.1 header fields. This is important because some older proxy servers do not handle these fields gracefully and may block the **POST** message.

It is important to note that the message is using HTTP/1.1 and therefore HTTP/1.1 header fields. This is important because some older proxy servers do not handle these fields gracefully and may block the **POST** message.

## How to Parse via PHP

The following example shows how to parse the POST message. It does not, however, show how to use this information on other pages, store the results in a database, report this to another device on the domain, etc. The response in this example will be sent back to the printer, but it will be ignored by the printer. If you wish to see the response you can use a packet sniffing tool such as Wireshark.

```
<?php

$alertMsg = urldecode($_POST["alertMsg"]);
if (preg_match("/(\w+(\s+\w+?)):\s+(((SGD
SET)\s+([\w\d\.\_]+)\s+\->\s+(.+))|([\w|\s]+))/", $alertMsg,
$matches)== 1) {

$alertType = $matches[1];

if ($matches[5] === "SGD SET") {
$alertCondition = $matches[5];
$alertSgdName = htmlspecialchars($matches[6]);
$alertSgdData = htmlspecialchars($matches[7]);
} else {
$alertCondition = $matches[3];
}
}

echo "<H1>Alert Received</H1><br/>\r\n";
echo "<h2>Original Message = $alertMsg</h2><br/>\r\n";
echo "<h2>Alert Type = $alertType</h2><br/>\r\n";
echo "<h2>Alert Condition = $alertCondition</h2><br/>\r\n";
echo "<h2>SGD Name = $alertSgdName</h2><br/>\r\n";
echo "<h2>SGD Value = $alertSgdData</h2><br/>\r\n";
?>
```

## Basic Configuration

To determine how much configuration is necessary, consider the following questions:

- Is the remote server that the printer is attempting to connect to outside of the corporate firewall?
- Does the firewall require a username and password to access the remote server?
- Does the printer require a proxy server to access the remote server?

If the answer to any of these questions is 'yes', then more than the basic configuration may be necessary. Depending upon the network environment that the printer is in access the remote server may only require that a few settings be set.

**To configure an alert to be sent via HTTP POST to a remote server , issue the following command:**

```
! U1 setvar "alerts.add" "PRINTER PAUSED,HTTP-  
POST,Y,Y,http://www.examplecorpinc.com/alerts.php,0,N,"
```

The above command will issue an HTTP POST alert to the remote server (<http://www.examplecorpinc.com/alerts.php>) when the printer is paused or un-paused.

- The first parameter indicates the condition to monitor. A list of available alert conditions can be viewed by issuing:  
`! U1 getvar "alerts.conditions"`
- The second parameter indicates the alert destination. For the purposes of this section HTTP-POST is the preferred destination. A list of available alert destinations can be viewed by issuing:  
`! U1 getvar "alerts.destinations"`
- The third and fourth parameters are 'Send on Set' and 'Send on Clear', respectively. They can be either "Y" for monitor the alert or "N" for don't monitor the alert. If both are set to "N" then the alert will not be added or it will be deleted if the alert already existed. To view which alerts already exist issue:  
`! U1 getvar "alerts.configured"`
- The fifth parameter holds the URL for the server that will be sent the HTTP POST. It holds a maximum of 255 characters for the URL and it must conform to the URI standards described in RFC3986 (<http://www.ietf.org/rfc/rfc3986.txt>).
- The sixth parameter should be set to 0 for HTTP POST alerts.
- The seventh parameter and eighth parameter will not be covered in this section and should be set as indicated in the description above. See the SGD documentation for details on these two parameters.

## When a Proxy Server is Part of the Network Configuration

If a proxy server must be used to access the remote server the printer's proxy setting must be set to point to the server. There are typically four properties associated with a proxy server.

- The proxy server scheme: **HTTP** is the only supported scheme
- The proxy server address
- The proxy server port (optional)
- The username and password for the proxy (optional)

**To supply the address of the proxy server, assuming a default port and no username/password, configure the proxy setting as follows:**

```
! U1 setvar "alerts.http.proxy" "http://my.internal.proxy/"
```

In this scenario, the proxy address is **my.internal.proxy** and the scheme is **HTTP**. The default port (1080) will be used. No username or password will be used to authenticate with the proxy.

**To specify an alternate port, configure the proxy as follows**

```
! U1 setvar "alerts.http.proxy" "http://my.internal.proxy:3128/"
```

To specify a username and password, configure the proxy as follows:

```
! U1 setvar "alerts.http.proxy"  
"http://user:pass@my.internal.proxy/"
```

The proxy username, password, and the rest of the URL must follow the rules specified in RFC3986 (<http://www.ietf.org/rfc/rfc3986.txt>).

## When HTTP Authentication is Necessary

Use this configuration when, for example, a firewall requires a username and/or password.

It may be necessary to specify a username and password to various routers and servers along the path to the remote server. Typically when using a browser to access the server the authentication request will be presented in the form of a dialog window that asks for the username and password.

Because the printer's connection to the remote server is headless and non-interactive, the alert http configuration allows a user to enter in a server name, username, password triplet. The triplet will be used in the event that the printer is presented with an authentication request (for example, this typically is requested via the HTTP/1.1 401 Unauthorized request).

To specify authentication credentials issue the following:

```
! U1 setvar "alerts.http.authentication.add" "servername.com username  
password"
```

In this scenario the server requesting authentication is servername.com. The username and password to be supplied are 'username' and 'password'. The server name can be either a DNS name or an IP address. The username and password cannot be retrieved from SGD, SNMP, or JSON once added. Only the server name will be returned.

More than one set of authentication triplets can be added. The printer will only use the credentials as they are needed. In other words, the printer will only use the credentials for servername.com if it receives a HTTP/1.1 401 Unauthorized request from servername.com.

To see what authentication triplets are specified issue:

```
! U1 getvar "alerts.http.authentication.entries"
```

To remove authentication credentials issue the following:

```
! U1 setvar "alerts.http.authentication.remove" "servername.com"
```

## Enabling Logging

If your printer has trouble connecting, you may wish to enable logging. By default, logging is not enabled in order to reduce the amount of memory consumed when the HTTP alert feature is enabled. It is recommended that once the alert HTTP feature is configured properly and is performing as expected that the logging be disabled or that a very small (less than 100) number of logging entries be permitted.

To enable logging, **alerts.http.logging.max\_entries** needs to be modified. By default it is set to 0, which indicates that no messages are logged. When attempting to troubleshoot connection issues it is recommended that max\_entries be set to at least 100 entries. Setting max\_entries to 100 means that the 100 newest logging entries will be present in alerts.http.logging.entries as older entries are discarded once the maximum number of entries is reached.

```
! U1 setvar "alerts.http.logging.max_entries" "100"
```

The logging settings do not require the printer to be reset before taking effect. This does not mean that previous logging message that would have been logged will appear when the max\_entries setting is changed from 0 to a greater value. It means that any new logging messages will be logged from that point forward.

Issue the following command to clear any log entries currently in the alerts.http.logging.entries buffer.

```
! U1 do "alerts.http.logging.clear" ""
```

## Navigating the Log Output

The log can contain much information, even in the scenario where the printer successfully connects to the remote server. This section explains how to read the log and highlights some of the key entries that will help to determine if the connection was successful.

A typical log entry looks as follows:

```
[12-04-2012 14:57:10.625] [http] Attempting connection to  
http://www.examplecorpinc.com/alerts.php
```

The first column is the date and time that the event occurred. The format of the date and time matches the format of **rtc.date** and **rtc.time**. The time, however, also includes the milliseconds to aid in troubleshooting network latency concerns.

The second column indicates the connection name, which is currently always set to '**http**'.

The third column is the actual message that contains information about what occurred in the printer at the corresponding time in column one. In the above example the printer was attempting to POST the alert to the connection to the URL specified in the configured alert.

Review [Understanding Errors in the Alerts HTTP Log](#) on page 1471 to understand what it means when certain logging messages/errors appear in the log.

## Understanding Errors in the Alerts HTTP Log

Error	Cause / Solution
<b>Couldn't connect to host</b>	<p>This could mean any number of things occurred that prevented the printer from connecting. This message is always present when the connection to the remote failed and is typically accompanied by an HTTP Response Code. See <a href="#">HTTP Messages on page 1472</a> for the possible HTTP Response Codes and their meaning.</p> <p>If this issue persists contact Zebra Technical Support.. See <a href="#">Contacts on page 9</a> and provide the output of the following command (ensure that logging is enabled and that this error appears within the entries).</p> <pre>! U1 getvar "alerts"</pre>

## Troubleshooting

Whenever troubleshooting a connection issue, the following questions should be answered to ensure the configuration is correct.

1. Is the printer connected correctly via Wireless or Ethernet?
2. Does the printer have a valid IP address?
3. Can I ping the printer's IP address from a device on the same network as the printer?
4. Is the remote server URL listed in the output of the **alerts.configured** SGD or **~HU** command output correct, and is the URL of a server iServer that is configured to accept **HTTP POST** requests?
5. Can you connect to the URL via a browser?
6. Is the remote server I am attempting to connect to outside the corporate firewall?
7. Does the firewall require a username and password to access the remote server?
8. Does the printer require a proxy server to access the remote server?
9. Is the proxy server port the default (1080) or another port?
10. Is the proxy server configured to allow **HTTP POST** messages?

- 11.** Is the proxy server HTTP 1.1 compliant and does it allow HTTP 100 Continue messages? For example, the Squid Proxy Server versions before v3.2 do not fully support HTTP 1.1 requests and may block any **HTTP POST** attempts from the printer.

**Note** • If using the Linux Proxy Server Squid, and you are having trouble connecting, note that it may be configured to:

- a. disallow POST messages
- b. only operate in HTTP/1.0 mode
- c. disallow SSL connections.

Refer to your Linux Squid documentation for complete details.

- 12.** Are there any **HTTP authentication** attempts when trying to connect that fail?

Are there any **HTTP/1.1 4xx** messages in the log?

If your connection issues persist and the solutions in this document do not help, contact Zebra Technical Support.. See *Contacts on page 9* and provide the output of the following command (ensure that logging is enabled and that this error appears within the entries).  
`! U1 getvar "alerts"`

## HTTP Messages

Message	Cause / Solution
<b>HTTP/1.1 100 Continue</b>	This indicates that the server and printer have begun communicating and is often seen in place of <b>HTTP/1.1 200 OK</b> .
<b>HTTP/1.1 200 OK</b>	This indicates that the <b>HTTP POST</b> was successful.
<b>HTTP/1.1 30x Moved/Redirect/etc</b>	This indicates that the URL specified has moved or that the firewall redirected the printer to another location (typically this is done to authenticate a user in a transparent proxy configuration).
<b>HTTP/1.1 401 Unauthorized</b>	This indicates that the printer either needs to authenticate with the server or failed to authenticate with the remote server (or server/router along the route to the server).
<b>HTTP/1.1 403 Forbidden</b>	This typically means that the authentication was provided and valid, however, the user does not have access to the requested resource.
<b>HTTP/1.1 404 Not Found</b>	This indicates that the remote URL provided points to an invalid location on the server. This does indicate, however, that the server name is valid. Just the path after the domain name is invalid.

# Advanced Techniques

This section presents information and commands for using advanced techniques, such as special effects, serialized data fields, control commands, program delimiters, communications, and memory cards.

## Special Effects for Print Fields

**Reverse Printing a Field** The **^FR** (Field Reverse Print) command allows a field to appear as white over black or black over white. When printing a field, the **^FR** command indicates that it will print the field the opposite of its background color.

**Reverse Printing a Label** The **^LR** (Label Reverse Print) command reverses the printing of all fields in the label format. It allows a field to appear as white over black or black over white. **^LR** functions like **^FR**, but it applies to all fields in a label. The **^LR** command remains active until turned off.

**Printing a Mirror Image** The **^PM** (Print Mirror Image of Label) command prints the entire printable area of the label as a mirror image. This command flips the image from left to right.

**Printing a Label Inverted 180 Degrees** The **^PO** (Print Orientation) command inverts the label format 180 degrees. In essence, the label is printed upside down.

## Serialized Data

The **^SN** (Serialization Data) command allows the printer to index data fields by a selected increment or decrement value (that is, make the data fields increase or decrease by a specified value) each time a label is printed. This can be performed on up to 100 to 150 fields in a given format and can be performed on both alphanumeric and bar code fields. A maximum of 12 of the right-most integers are subject to indexing. The first integer found when scanning from right to left starts the indexing portion of the data field.

If the alphanumeric field to be indexed ends with an alpha character, the data will be scanned, character-by-character, from right to left until a numeric character is encountered. Serialization will take place using the value of the first number found.

## Variable Data

To increase throughput, you can set up a program that uses variable data fields. Then, instead of formatting the whole label each time a label is printed, the printer will have to format only the changed data field. To use this capability, you must use the **^MC** and **^FV** commands.

## Stored Formats

You can create formats and save them in the printers memory. A stored format can then be recalled and merged with downloaded data to form a complete label. This process saves data transmission time but not formatting time.

**To create a format, complete these steps:**

1. Design the label.
2. Replace variable data fields with field numbers.
3. Allocate space for the size of the field.
4. Give the format a name.
5. Save the format on the printer to a memory location (R, E, B, A).

You can store multiple formats on the printer, limited only by available memory. If you try to save a format that would overload memory you can confirm that the format has been successfully stored on the printer by printing the LIST FORMATS from the front panel, or by using the `^HW` command to return the directory listing to the host. For details see, [^HW on page 233](#).

If the power is turned off, all stored formats in volatile memory (R:) will be lost.

## Initialize/Erase Stored Formats

Stored formats can be selectively erased using the `^ID` command.

## Download Format Command

The `^DF` (Download Format) command saves the ZPL II format commands as text strings to be later merged using `^XF` with variable data. The format to be stored may contain Field Number (`^FN`) commands to be referenced when recalled.

While use of stored formats will reduce transmission time, no formatting time is saved since this command saves the ZPL II as text strings which need to be formatted at print time.

## Field Number Command

The `^FN` (Field Number) command is used to number the data fields. This command is used in both Store Format and Recall Format operations.

When storing a format, the `^FN` command is used where you would normally use the `^FD` (Field Data) command. When recalling the stored format, use `^FN` in conjunction with the `^FD` (Field Data) command.

## Recall Stored Format Command

The ^XF (Recall Format) command recalls a stored format to be merged with variable data. There can be multiple ^XF commands and they can be located anywhere in the label format.

When recalling a stored format and merging data utilizing the ^FN (Field Number) function, the calling format must contain the ^FN command to properly merge the data.

While use of stored formats will reduce transmission time, no formatting time is saved because the format being recalled was saved as text strings that need to be formatted at print time.

**Example:** These are examples of using stored format:

Working with Stored Format commands involves designing and saving a stored format, then recalling and merging the format with some variable data.

The following is an example of how to use the various Stored Format commands. First, enter the following format and send it to the printer. Notice that no label is printed. (DATA Indicator went On and Off.)

```
^XA^DFFORMAT^FS
^LH30,30
^BY2,3,100
^FO120,100^CFD^FN1^FA9^FS
^FO120,160^B3^FN2^FA6^FS
^XZ
```

Second, enter the following format and send it to the printer. The label shown will be printed.

```
^XA^XFFORMAT^FS
^FN1^FDLABEL ONE^FS
^FN2^FDAAA001^FS
^XZ
```

**LABEL ONE**

## Control Commands

Control commands may be sent from the host at any time to elicit an immediate response from the printer. Control commands may be sent in a group or separately.

A control command is acted upon when received to perform a variety of actions, such as:

- clearing the memory

- physical action
- a combination of the above such as feeding a label and calculating and storing its length.

The basic format for using all of the control commands is:

~(2-letter command)

For example: ~DG

## Test and Setup Commands

The following commands, presented in alphabetical order, are used to test various elements of the printer and its status.

**Table 60 • Test and Setup Commands**

Command	Function
<b>~HM</b> (Memory Status)	Sending this command to the printer immediately returns a memory status message to host. Use this command whenever you need to know the status of the memory.
<b>~HS</b> (Host Status)	Sending this command to the printer immediately returns a three-line printer status message to the host. Use this command whenever you need to know the status of the printer.
<b>~JR</b> (Power On Reset)	This command resets all of the printer's internal software, performs a power-on self-test, clears the buffer and DRAM, and resets communication parameters and default values. <b>~JR</b> performs the same function as a manual power-on reset.
<b>~JN</b> (Head Test Fatal)	This command resets the printhead element error override, acting as a toggle for <b>~JO</b> . The printer then goes into fault status (turns head indicator on steadily) if any subsequent execution of the printing element test detects bad printing elements. This command is only functional on certain printer platforms.
<b>~JO</b> (Head Test Non-Fatal)	This command overrides a failure of head element status check and allows printing to continue. The override is canceled when the printer is turned off or receives a <b>~JR</b> or <b>~JN</b> command. The printhead test will not produce an error if the <b>~JO</b> override is active. This command is only functional on certain printer platforms.
<b>^JT</b> (Head Test Interval)	This command lets you change the printhead test interval from 100 to any desired interval. The printer automatically performs an internal printhead element test, which occurs every 100 labels. This takes place during formatting which minimizes a delay in printing. Therefore, the test may be performed while the printer is in PAUSE. This command is only functional on certain printer platforms.
<b>~WC</b> (Print Configuration Label)	The <b>~WC</b> command is used to generate a printer configuration label. The printer configuration label contains information about the printer setup, such as sensor type, network ID, ZPL mode, firmware version, and descriptive data on the <b>R:</b> , <b>E:</b> , <b>B:</b> , and <b>A:</b> devices.
<b>~HQ</b> (Host Query)	The <b>~HQ</b> command group causes the printer to send information back to the host.

## Calibration and Media Feed Commands

The following commands, presented in alphabetical order, are used to perform various media and ribbon calibrations and also set the media feed mode for the printer.

**Table 61 • Calibration and Media Feed Commands**

Command	Function
<b>~JC</b> (Set Media Sensor Calibration)	Forces a label length measurement and recalibrates the media and ribbon sensors.   <b>Note</b> • In continuous mode, only the media and ribbon sensors are recalibrated.
<b>~JG</b> (Graphing Sensor Calibration)	Forces a label length measurement, recalibrates the media and ribbon sensors, and prints a graph (media sensor profile) of the sensor values.
<b>~JL</b> (Set Label Length)	Sets the label length. Depending on the size of the label, the printer will feed one or more blank labels.
<b>^MF</b> (Media Feed)	Dictates what happens to the media at power up and after an error is cleared.

## Cancel/Clear Commands

The following command controls the contents of the Zebra input buffer.

**Table 62 • Cancel/Clear Commands**

Command	Function
<b>~JA</b> (Cancel All)	Cancels all format commands in the buffer. It also cancels any batches that may be printing. The printer stops printing after the current label (if one is printing) is finished printing. All internal buffers are cleared of data. The DATA LED turns off.

## Printer Control Commands

The following commands control various printer operations:

**Table 63 • Printer Control Commands**

Command	Function
<b>^PF</b> (Slew Given Number of Dot Rows)	Causes the printer to slew labels (move labels at a high speed without printing) a specified number of dot rows, at the bottom of the label. This allows faster printing when the bottom portion of a label is blank.
<b>~PH</b> or <b>^PH</b> (Slew to Home Position)	Causes the printer to feed one blank label. <ul style="list-style-type: none"> <li>The <b>~PH</b> command feeds one label after the format currently being printing is done or when the printer is placed in pause.</li> <li>The <b>^PH</b> command feeds one blank label after the format it is in prints.</li> </ul>
<b>~PP</b> (Programmable Pause)	Stops printing after the current label is printed (if one is printing) and places the printer in the Pause mode.  The operation is identical to pressing the PAUSE button on the front panel of the printer. The printer will remain paused until the PAUSE button is pressed or a <b>~PS</b> command is sent to the printer.
<b>^PP</b> (Programmable Pause)	This command pauses the printer after the format it is in prints. Because this command is not executed immediately, several labels may be printed before the printer is paused.  The operation is identical to pressing the PAUSE button on the front panel of the printer. The printer will remain paused until the PAUSE button is pressed or a <b>~PS</b> command is sent to the printer.
<b>^PQ</b> (Print Quantity)	This command gives control over several printing operations. It controls the number of labels to print, the number of labels printed before the printer pauses, and the number of replications of each serial number.
<b>^PR</b> (Print Rate)	Determines the media speed during printing and the slew speed (feeding a blank label). The printer will operate with the selected speeds until the setting is resent in a subsequent format or the printer is turned off.  <b>Limitations of Higher Print Speeds</b> Print speed is application specific. Because print quality is affected by media and ribbon, printing speeds, and printer operating modes, it is very important to run tests for your applications. <ul style="list-style-type: none"> <li>With high print speeds, use thermal transfer mode only.</li> <li>Horizontal bar codes with a minimum x dimension of 5 mil may be printed at print speeds of 2 in. (51mm) per second.</li> <li>Rotated bar codes are limited to a minimum x dimension of 10 mil (modulus 2) at higher print speeds. At x dimension of 5 mil (modulus 1), they may be printed at 2 in. per second.</li> <li>At high print speeds, Font A at a magnification of 1 is not recommended; all other fonts are acceptable.</li> </ul>
<b>~PS</b> (Print Start)	Causes a printer in the Pause mode to resume printing. The operation is identical to pressing the PAUSE button on the front panel of the printer when the printer is already in the Pause mode.

## Set Dots/Millimeter

Command	Function
<b>^JM</b> (Set Dots/Millimeter)	<p>Changes the number of dots printed per millimeter. Depending on the printhead, normal dots per millimeter on a Zebra printer are the following:</p> <ul style="list-style-type: none"> <li>• 24 dots/mm (609.6 dots/inch)</li> <li>• 12 dots/mm (304.8 dots/inch)</li> <li>• 8 dots/mm (203.2 dots/inch)</li> <li>• 6 dots/mm (152.4 dots/inch)</li> </ul> <p>In some applications, these high densities are not required. For these applications, a lower density of 4 dots/mm (102 dots/inch) or 3 dots/mm (77 dots/inch) can be selected.</p> <p>If used, this command must be entered before the first <b>^FS</b> command.</p>

## Host Status Commands

Table 64 • Host Status Commands

Command	Function
<b>~HI</b> (Host Identification)	<p>This command is designed to be sent from the Host to the Zebra printer to find out the type of Zebra printer. Upon receipt, the Zebra printer will respond to the Host with a character string that gives information about the printer such as the version of firmware, dots per inch, memory, and printer options.</p>
<b>^SP</b> (Start Print)	<p>This command allows a label to start printing at a specified point before the entire label has been completely formatted. On extremely complex labels, this command can increase the overall throughput of the printer.</p> <p>The command works as follows: you specify the dot row at which the <b>^SP</b> command is to take affect. This then creates a label 'segment.' Once the <b>^SP</b> command is processed, all information in that segment will be printed. During the printing process, all of the commands after the <b>^SP</b> will continue to be received and processed by the printer.</p> <p>If the segment after the <b>^SP</b> command (or the remainder of the label) is ready for printing, media motion does not stop. If the next segment is not ready, the printer will stop "mid-label" and wait for the next segment to be completed. Precise positioning of the <b>^SP</b> command is somewhat of a trial-and-error process as it depends primarily on print speed and label complexity.</p> <p>The <b>^SP</b> command can be effectively used to determine the worst-case print quality. You can determine if using the <b>^SP</b> command is appropriate for the particular application by using the following procedure. If you send the label format up to the first <b>^SP</b> command and then wait for printing to stop before sending the next segment, the printed label will be a sample of the worst case print quality. It will also drop any field that is out of order.</p>

**Table 64 • Host Status Commands (Continued)**

Command	Function
<b>~WC</b> (Print Configuration Label)	This command is used to generate a printer configuration label. This command only works when the printer is idle.
<b>~WL</b> Print Network Configuration Label	This command is used to generate a network configuration label. This command only works when the printer is idle.

## Changing Delimiters and Command Prefixes

**Important** • The delimiters used in the incoming ZPL script must match the delimiters set on the printer. If you change the delimiters on the printer, any ZPL script that uses the default delimiters will not work.

For some applications, you may need to change the ZPL II default delimiter (,) the format command default prefix (^), and/or the control command default prefix (~). Any ASCII character may be set as the delimiter.

You might change these characters if you are using a hand-held terminal that does not have a comma to enter the ZPL II commands, if you are working with a mainframe that has trouble processing the caret, or if you find some other character(s) easier to use.

Reasons to set an alternate delimiter include, but are not limited to:

- you are using a hand-held terminal that does not have a comma to enter the ZPL II commands;
- you are working with a host system that does not easily output the default delimiter (for example, AS/400)
- you find some other character(s) easier to use.

## Communication Diagnostics Commands

Zebra printers support communication diagnostics through both hardware and software control. You can use these diagnostics to troubleshoot programs.

**Table 65 • Communication Diagnostics Commands**

Command	Function
<b>~JD</b> (Enable Communications Diagnostics)	Initiates a diagnostic mode that produces an ASCII printout (using current label length and full width of printer) of all characters received by the printer. This printout includes the ASCII Characters, the HEX value and any communication errors.
<b>~JE</b> (Disable Diagnostics)	Cancels the diagnostic mode and returns the printer to normal label printing.

## Graphic Commands

In addition to text and bar codes, multiple types of graphics can be printed on a Zebra printer:

- boxes and lines (^**GB**), circles (^**GC**), diagonal lines (^**GD**), and ellipses (^**GE**)
- ZPL II label formats saved as graphics images
- graphic images in Hexadecimal format
- graphic symbols (^**GS**)
- 

**Table 66 • Boxes, Lines, Circles, Diagonal Lines, and Ellipses**

Command	Function
<b>^GB</b> (Graphic Box)	The ^ <b>GB</b> command is used to draw boxes and lines as part of a label format. Boxes and lines are used to highlight important information, divide labels into distinct areas, or to improve the appearance of a label. The same format command is used for drawing either boxes or lines.
<b>^GC</b> (Graphic Circle)	The ^ <b>GC</b> command produces a circle on the printed label. The command parameters specify the diameter (width) of the circle, outline thickness, and color. Thickness extends inward from the outline.
<b>^GD</b> (Graphic Diagonal Line)	The ^ <b>GC</b> command produces a circle on the printed label. The command parameters specify the diameter (width) of the circle, outline thickness, and color. Thickness extends inward from the outline.
<b>^GE</b> (Graphic Ellipse)	The ^ <b>GE</b> command produces an ellipse in the label format.
<b>^GS</b> (Graphic Symbol)	The ^ <b>GS</b> command enables you to generate the registered trademark, copyright symbol, and other symbols.

These label formats can also be stored as graphic images and data can be merged with them at print time. Additionally, ZPL II will permit the printing of graphic images from other sources that have been created in (or converted to) hexadecimal (HEX) format. Such graphic images can come from a variety of sources, including CAD programs, draw and paint programs, and scanned images.

## Image Move

The ^**IM** (Image Move) command performs a direct move of an image from a storage area into the bitmap. The command is identical to the Recall Graphic command except that there are no sizing parameters.

## Working with Label Formats as Graphics

The **^IS** (Image Save) and **^IL** (Image Load) commands are used to save a ZPL label format (including text and/or bar codes) in the printer's DRAM, FLASH, or PCMCIA as a special graphic image. The **^IS** (Image Save) and **^IL** (Image Load) commands are used to save a ZPL label format (including text and/or bar codes) in the printer's DRAM, FLASH, PCMCIA, or battery backed up SRAM, as a special graphic image. This increases the throughput of a series of similar but not identical labels.

Instead of formatting each individual label completely, store the constant fields as an image (known as creating a template). Then, in subsequent label formats, commands are issued to recall that graphic image format and merge it with variable data.

## Working with Hex Graphic Images

ZPL II can be used to save graphic images in HEX format in DRAM, FLASH, or PCMCIA, depending on the type of memory installed in your printer. ZPL II can be used to save graphic images in HEX format in DRAM, FLASH, PCMCIA, or battery backed up SRAM, depending on the type of memory installed in your printer. The image might be created using a CAD program, a draw or paint program, or a scanner. These images can then be printed on the label. Graphic images may be created using a program that creates files in the .PCX format. These files must then be converted to ZPL II graphic format .GRF (pure hexadecimal data without headers or other extraneous information) for use as part of a label format.

You can use ZebraDesigner or ZebraNet Bridge Enterprise to convert the .PCX graphic format into the pure hexadecimal .GRF graphic format. Hexadecimal data may also be directly input as part of a ZPL II program. Manually preparing a string of HEX code is possible but usually impractical.

## Alternative Data Compression Scheme for ~DG and ~DB Commands

There is an alternative data compression scheme recognized by the Zebra printer. This scheme further reduces the actual number of data bytes and the amount of time required to download graphic images and bitmapped fonts with the **~DG** and **~DB** commands.

**Note** • Values start with G since 0 through 9 and A through F are already used for HEX values.)

<b>G</b>	<b>H</b>	<b>I</b>	<b>J</b>	<b>K</b>	<b>L</b>	<b>M</b>	<b>N</b>	<b>O</b>	<b>P</b>	<b>Q</b>	<b>R</b>	<b>S</b>	<b>T</b>	<b>U</b>	<b>V</b>	<b>W</b>	<b>X</b>	<b>Y</b>
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19

These numbers represent the repeat counts 20, 40, 60, 80,...400 on a subsequent hexadecimal value.

<b>g</b>	<b>h</b>	<b>i</b>	<b>j</b>	<b>k</b>	<b>l</b>	<b>m</b>	<b>n</b>	<b>o</b>	<b>p</b>	<b>q</b>
20	40	60	80	100	120	140	160	180	200	220
<b>r</b>	<b>s</b>	<b>t</b>	<b>u</b>	<b>v</b>	<b>w</b>	<b>x</b>	<b>y</b>	<b>z</b>		
240	260	280	300	320	340	360	380	400		

→ **Example 1:** Sending **M6** to the printer is identical to sending the following hexadecimal data:  
**6666666**  
The M has the value of 7. Therefore **M6** sends seven (7) hexadecimal 6's.

→ **Example 2:** Sending **hB** to the printer is identical to sending the following hexadecimal data:  
**BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB**  
The h has a value of 40. Therefore, **hB** sends 40 Hexadecimal B's.

### Repeat Values

Several repeat values can be used together to achieve any desired value.

Several repeat values can be used together to achieve any value desired. vMB or MvB will send 327 hexadecimal B's to the printer.

- a comma (,) fills the line, to the right, with zeros (0) until the specified line byte is filled.
- an exclamation mark (!) fills the line, to the right, with ones (1) until the specified line byte is filled.
- a colon (:) denotes repetition of the previous line.

## Recalling a Hexadecimal Graphic Image

The ^XG (Recall Graphic) command is used to recall one or more graphic images for printing. This command is used in a label format to merge pictures such as company logos and piece parts, with text data to form a complete label.

An image may be recalled and resized as many times per format as needed. Other images and data may be added to the format.

## Reducing Download Time of Graphic Images

There is a method of reducing the actual number of data bytes sent to the printer when using the ~DG command.

If the HEX string ends in an even number of zeros (0's), a single comma (,) can be substituted for ALL of the zeros. If the HEX string ends in an odd number of zeros, one zero and a single comma is required. The exclamation mark (!) and the colon (:) described under *Repeat Values on page 1484* can also be used.

**Note** • The text rows in your editor may not be the same as the dot rows used by ZPL II. The editor may word wrap or truncate the dot rows. ZPL II ignores the end of a text line (carriage returns and line feed characters).

## Transferring Object Between Storage Devices

The ^TO (Transfer Object) command is used to copy an object or group of objects from one storage device to another. It is quite similar to the copy function used in personal computers.

Source and destination devices must be supplied and must be different and valid for the action specified. Invalid parameters will cause the command to be ignored.

There are no defaults associated with this command. However, the asterisk (\*) may be used as a wild card for Object names and extensions. For instance, ZEBRA.\* or \*.GRF would be acceptable forms for use with ^TO command.

The Asterisk (\*) can be used to transfer multiple object files (except \*.FNT) from the DRAM to the Memory Card. For example, you have several object files that contain logos. These files are named **LOGO1.GRF**, **LOGO2.GRF**, and **LOGO3.GRF**.

**Example:** You want to transfer all of these files to the Memory Card using the name NEW instead of LOGO. By placing an Asterisk (\*) after both LOGO and NEW in the transfer command, you can copy all of these files with one command. The format for this would be as follows:

```
^XA  
^TOR:LOGO*.GRF,B:NEW*.GRF  
^XZ
```

**Note** • If, during a multiple transfer, a file is too big to be stored on the Memory Card, it will be skipped. All remaining files will be checked to see if they can be stored. Those that can be stored, will be stored.

## Deleting Graphics from Memory

The ^ID (Item Delete) command deletes objects, images, fonts, and formats from storage areas selectively or in groups. This command can be used within a printing format to delete objects just prior to saving new ones or can be in a stand-alone type format simply to delete objects.

The object name and extension support the use of the asterisk (\*) as a wildcard. This allows for easy deletion of selected groups of objects.

The following are various examples of using the ^ID command.

- **Example 1:** To delete just stored formats from DRAM:  
`^XA^IDR:*.ZPL^XZ`
- **Example 2:** To delete formats and images named SAMPLE from DRAM regardless of the extension:  
`^XA^IDR:SAMPLE.*^XZ`
- **Example 3:** To delete the image SAMPLE1.GRF prior to storing SAMPLE2.GRF:  
`^XA  
^F025,25^AD,18,10^FDDelete^FS  
^F025,45^AD,18,10^FDthen Save^FS  
^IDR:SAMPLE1.GRF^FS  
^ISR:SAMPLE2.GRF^FS  
^XZ`
- **Example 4:** To delete everything from DRAM:  
`^XA^IDR:*.**^XZ`

## Defining and Using the AUTOEXEC.ZPL Function

An **AUTOEXEC.ZPL** file function is supported by the printer. It functions in much the same way as the **AUTOEXEC.BAT** file in MS-DOS. The **AUTOEXEC.ZPL** file function can be used for setting up various parameters at the time the printer is powered up (such as **^COY**, **^LL**, **^CWF**). The function can also be recalled at any time after power up.

This file must initially be in the extra EPROM, FLASH, or PCMCIA memory. When the printer is powered on, it looks to the extra memory site for the stored format called **AUTOEXEC.ZPL**. If found, the contents of the file are automatically executed as a stored format.

- **Example:** This is an example of an **autoexe.zpl** file:  
`^XA  
^DFE:AUTOEXEC.ZPL^FS  
^SEE:JIS.DAT^FS  
^CW1,E:ANMDJ.TTF^FS  
^XZ`

## Memory, Flash Cards, and Font Cards

Zebra printers come with a variety of memory device, including DRAM, EPROM, PCMCIA, Flash, socket Flash, and battery backed-up RAM.

**Note •** Not all memory options are available on all printers.

Most Zebra printers allow you to print a printer configuration label, which will show the letter designation assigned to your printer memory options. For printer models that do not support this feature, use [Table 67](#) to see how the memory IDs are assigned. Memory IDs default to these values when the printer is reset to factory defaults.

**Table 67 • Letter Designations for Different Memory Options**

Memory Option	Default Letter Designation
EPROM	E:
PCMCIA	B:
Flash	E:
DRAM	R:
Battery backed-up RAM	B: or E:
Socket Flash	B:
Compact Flash	A:

A few ZPL II commands directly affect the types of memory available to Zebra printers. These commands are `~JB`, `^JB` and `~HM`

**Table 68 • Commands that Affect Available Memory Types**

Command	Function
<code>~JB</code> (Reset Battery Dead)	<p>This command is sent to the printer if either of these conditions exist:</p> <ul style="list-style-type: none"> <li>• If the B: memory card is intentionally cleared (reinitialized).</li> <li>• If the battery supplying power to the Battery Powered Font Card fails and is replaced. (A bad battery would show a “battery dead” condition on the printer configuration label.)</li> </ul> <p> <b>Note •</b> If you replace the battery but do not send this command to the printer, the Battery Powered Font Card will not function.</p>

**Table 68 • Commands that Affect Available Memory Types (Continued)**

Command	Function
<b>^JB</b> (Initialize Flash Memory)	<p>This command is used to initialize the two types of Flash Memory available in the Zebra printers.</p>  <p><b>Note</b> • Link-OS printers use an automatic memory management system that eliminates the need to manually initialize the Flash Memory system.</p>
<b>~HM</b> (Host Memory Status)	<p>Sending this command to the printer immediately returns a memory status message to the host. Use this command whenever you need to know the status of the memory.</p> <p>When the Host Memory Status Command, <b>~HM</b>, is sent to the Zebra printer, a line of data containing three numbers is sent back to the Host. The following is an example:</p> <p style="text-align: center;"><b>1024,0780,0780</b></p> <ul style="list-style-type: none"> <li>• The first value is the total amount of RAM (Random Access Memory) installed in the printer. This number is in Kilobytes.</li> <li>• The second value is the maximum amount of RAM available to the user. This number is in Kilobytes.</li> <li>• The third value is the amount of RAM currently available to the user. This number is in Kilobytes.</li> </ul>

## Shortcuts and Alternate Schemes for Writing ZPL II Scripts

ZPL II programming scripts can be written in a variety of ways. There are, however, more efficient ways to write a ZPL II script depending on the application and the commands used. The following are certain ways to write the same ZPL II script, each yielding the same result.

**Example 1:** The Code 39 bar code shows the ZPL II script written like this:

```
^XA^F0100,75^BY3
^B3N,N,100,Y,N
^FD123ABC^XZ
```

Since it is only one field, however, the entire command can be written as a one line entry:

```
^XA^F0100,75^BY3^B3N,N,100,Y,N^FD123ABC^XZ
```

Finally, this script can be further simplified by writing it on one line, using the comma (,) delimiter to reduce the default parameters in the **^B3** command and eliminating the default parameters at the end of the **^B3** command:

```
^XA^F0100,75^BY3^B3,,100^FD123ABC^XZ
```

**Example 2:** You might write your ZPL II scripts in any way that makes sense to you. Some programmers prefer to write out each format command and field on a line by line basis like this:

```
^XA  
^PR2^FS  
^LL935^FS  
^LH30,30^FS  
^FO20,10^AF^FDZEBRA^FS  
^FO20,60^B3,,40^FDAA001^FS  
^FO20,180^AF^SNSERIAL NUMBER 0000000111,1,Y^FS  
^PQ10^FS  
^XZ
```

Although this script will print with no problems, it contains unnecessary **^FS** (Field Separator) commands which have been placed after the format commands. Some programmers feel it is required to place a **^FS** command at the end of each line, but the **^FS** command is only needed to separate specific fields. Therefore, the script would transmit more quickly written like this:

```
^XA  
^PR2  
^LL935  
^LH30,30  
^FO20,10^AF^FDZEBRA^FS  
^FO20,60^B3,,40^FDAA001^FS  
^FO20,180^AF^SNSERIAL NUMBER 0000000111,1,Y^FS  
^PQ10  
^XZ
```

Other programmers prefer to keep the format commands on one line as an organizational preference, like this:

```
^XA^PR2^LL935^LH30,30  
^FO20,10^AF^FDZEBRA^FS  
^FO20,60^B3,,40^FDAA001^FS  
^FO20,180^AF^SNSERIAL NUMBER 0000000111,1,Y^FS  
^PQ10^XZ
```

The label will print out the same so you should develop a scripting pattern that suits your own organizational style but one which is efficient and is concerned with keeping transmission times to a minimum.

## Font Shortcuts

There are times when you might include a specific font into your script and use it repeatedly within different fields. The following is an example of one way to write this script:

```
^XA
^FO120,108^A0N,89^FDA Guide to^FS
^FO120,207^A0N,89^FDZPL II^FS
^FO120,306^A0N,89^FDProgramming^FS
^FO120,405^A0N,89^FDLanguage^FS
^XZ
```

Notice that the **^FS** command is used on the second to last line to close the field. Actually, it is unnecessary because the **^XZ** will accomplish the same thing, so we can remove it from our script. Also, since the font and font size are not changing within the fields, this script can be simplified for quicker transmission by removing the unnecessary font entries and listing the font information once using the **^CF** command (see [^CF on page 148](#)):

```
^XA
^CF0,89
^FO120,108^FDA Guide to^FS
^FO120,207^FDZPL II^FS
^FO120,306^FDProgramming^FS
^FO120,405^FDLanguage
^XZ
```

This script can be made even more efficient by including the **^FB** command to identify the left origin of the text which occurs at the same place each time. For details, see [^FB on page 181](#):

```
^XA
^CF0,89
^FO120,108
^FB800,6
^FDA Guide to\&ZPL II\&Programming\&Language
^XZ
```

**Note** • The entries “\&” within the text indicate a carriage return/line feed as allowed by the **^FB** command. For details, see [^FB on page 181](#).

If you wanted to change the font type or size within the script, however, you would need to include the specific font parameters within the field where the change occurs. In this case, you would not want to use the **^FB** command because the change in font size (in our example below) will affect the y-axis (up and down) position of the text.

You can still use the **^CF** command, but you will need to include the specific font information on the line where the change in the field occurs:

```
^XA
^CF0,89
^FO120,108^FDA Guide to^FS
^FO120,207^FDZPL II^FS
^FO120,306^A0N,110^FDProgramming^FS
^FO120,426^FDLanguage
^XZ
```

# Glossary

**ASCII** American Standard Code for Information Interchange. A 7-bit character set that includes Latin characters, as well as control and punctuation characters.

**bidirectional text layout** The arrangement of characters with mixed directionality on a single line. For example, English and Arabic.

**big-endian** In the encoding, the most significant byte is stored first.

**byte order mark** BOM; indicates big-endian (BE) or little-endian (LE).

**character** The smallest component of a writing system that has understanding, refers to the abstract meaning not the specific shape.

**character code** Another term for code point.

**character set** A collection of characters.

**character shaping** Characters assume different glyptic forms depending on the context. They can be used with a script-based language.

**code point** An integral reference number assigned to a character.

**coded character set** An ordered collection of characters that are assigned an integral reference number.

**combining semantic cluster** Consists of an atomic character, a combining character sequence consisting of a base character plus one or more nonspacing marks, enclosing marks, combining word joiner, such as an Indic virama, or a sequence of Hangul jamos equivalent to a Hangual syllable.

**diacritic** A mark that is added to a letter or other character to change its value or meaning.

**encoding** The mapping of a characters code points to a sequence of bytes used to represent the data.

**font** An electronic collection of glyphs used for the visual representation of characters.

**GB18030** A standard required by the People's Republic of China for operating systems of non-handheld computers.

**GB 2312** A Chinese character set and encoding.

**glyph** The visual representation of a character, such as a shape or image. A default glyph character is typically used when the requested glyph is not available in the font.

**grapheme cluster** Consists of an atomic character, a combining character sequence consisting of a base character plus one or more nonspacing marks or enclosing marks, or a sequence of Hangul jamos equivalent to a Hangul syllable.

**ISO 10646** An international standard that defines the Universal Character Set (UCS) and a character encoding. The UCS matches Unicode.

**ISO 8859-1** An encoding standard for representing Western European languages using the Latin Alphabet.

**language** A system of sounds and scripts used to represent and communicate concepts, ideas, meanings, and thoughts.

**ligature** A glyph representing a combination of two or more characters.

**little-endian** In the encoding, the least significant byte is stored first.

**open type** A file format for scalable font files that extends the existing TrueType font file format used by Microsoft Windows and Apple Macintosh operating systems. OpenType tables support advanced layout features.

**presentation form** A pre-combined character, ligature or variant glyph that has a separate code point; used for compatibility.

**rts/cts** A method for a hardware handshake via the request-to-send/clear-to-send pins.

**script** A collection of symbols used to represent textual information in one or more writing systems.

**Shift-JIS** A shifted encoding of the Japanese character encoding standard, JIS X 0208, heavily deployed in PCs.

**True type** An outline font format that is scalable without quality loss.

**Unicode** The universal character set and encoding maintained by the Unicode Consortium.

**UTF-8** The Unicode encoding that assigns each character code point to a sequence of one to four bytes.

**UTF-16** A Unicode encoding form that represents Unicode code point values in the BMP with 16-bit code units and Unicode code point values in the supplementary planes with pairs of 16-bit code units.

**UTF-16BE** A Unicode encoding scheme based on UTF-16 that serializes the bytes in each code unit in big-endian order.

**UTF-16LE** A Unicode encoding scheme based on UTF-16 that serializes the bytes in each code unit in little-endian order.
